PICO DELLA MIRANDOLA, dēl'la mē-rān'-dō-lā, GIOVANNI, COUNT (1463-94). An Italian philosopher and theologian. He was born Feb. 24, 1463, the son of the sovereign prince of Mirandola and Concordia. He studied at the University of Bologna and afterward visited the principal schools of Italy and France. At the age of 23 he returned to Rome and immediately sought an opportunity of showing his learning by publicly posting up no fewer than 900 theses or propositions in logic, ethics, physics, mathematics, theology, science, and cabalistic magic, drawn from Latin, Greek, Jewish, and Arabic writers, offering to maintain an argument on each against all the scholars of Europe and undertaking to pay the expenses of those who came from a distance. Pico presumptuously entitled his theses *De Omni Re Scibili* (On Everything that can be Known). Pope Innocent VIII refused to allow Pico to carry on this discussion inasmuch as some of his theses were deemed heretical. But Alexander VI cleared him of the charge of heresy. He died Nov. 17, 1494, at the early age of 31. A complete edition of his works was published at Bologna in 1496; it has since been frequently reprinted. In philosophy Pico was a Neoplatonist, though his thoughts were tinged with cabalism. His collected works were published in Basel (1601). A *Platonick Discourse upon Love*, first published in English translation in 1651, has been reprinted (Boston, 1914). Consult: Georg Dreydorff, *Das System des Johannes Pico von Mirandola und Concordia* (Marburg, 1858); G. F. Pico, *Giovanni Pico della Mirandola: His Life by his Nephew*, translated by Sir Thomas More, and edited by J. M. Rigg (London, 1890); Massetani, *La filosofia cabalistica di G. Pico della Mirandola* (Empoli, 1897); Walter Pater, *The Renaissance: Studies in Art and Poetry* (Library ed., London, 1910).

PICOT, pē'kō', AUGUSTE EMILE (1844-). A French scholar, historian, and bibliographer, born in Paris. He was secretary of Prince Charles of Rumania from 1866 to 1867, Vice Consul at Temesvár (1869-72), and then became instructor (1875) and professor (1878) at the Ecole des Langues Orientales Vivantes, Paris. In 1879 he was elected honorary member of the Rumanian Academy, in 1892 honorary member of the Academy of Serbia, and in 1897 member of the Institute of France. In 1913 his friends and pupils presented him two volumes of *Mélanges* on the occasion of his retirement from active teaching. The first volume of this work contains a complete bibliography of his publications. A prolific writer, especially on the history of Rumania and early French literature, Picot published: *Les Serbes de Hongrie* (1873-74), which aroused considerable discussion at the time; *Alexandre le Bon, prince de Moldavie* (1882), with Bengesco; *Chants populaires des Roumains de Serbie* (1889); *Bibliographie cornélienne* (1876); *Catalogue de la bibliothèque de feu M. le baron James de Rothschild* (4 vols., 1884-1912); *Pierre Gringore* (1877); *La sottie en France* (1878);

Documents pour servir à l'histoire de l'ancien théâtre français (3 vols., 1878-82); *Les français italianisants du XVIe siècle* (2 vols., 1906); *Nouveau recueil de farces* (1880), with K. Nyrop; *Recueil général des sotties* (3 vols., 1902-12); *Œuvres poétiques de Guillaume Aleais* (3 vols., 1896-1908), with A. Piaget; *Le mystère du Viel Testament* (6 vols., 1878-91), with J. de Rothschild; *Le jardin de plaisance et fleur de rhétorique* (1910); *Recueil manuscrit de poésies exécutés pour Jacques Le Lieur vers 1520* (1912); *Notice sur Jacques Le Lieur* (1913).

PICOT, AUGUSTE HENRI MARIE. See DAM-PIERRE, A. H. M. P., MARQUIS DE.

PICOT, GEORGES (1838-1909). A French jurist and historian. He was born in Paris, studied law, and in 1865 was appointed judge at the Seine tribunal. In 1877 he received a post in the Ministry of Justice, from which he retired when Grévy became President, to become editor of *Le Parlement*, the organ of the Left Centre. In 1878 he was elected to succeed Thiers in the Academy of Moral and Political Sciences and in 1896 became its perpetual secretary. Among Picot's writings the chief are: *Recherches sur la mise en liberté sans caution* (1863); *Les élections aux Etats généraux dans les provinces, 1302-1614* (1874); *Histoire des Etats généraux* (1872; 2d ed., 1888), his best work, twice winner of the Gobert prize; *La réforme judiciaire* (1881); *Un devoir social et les logements d'ouvriers* (1885); *Pacification religieuse* (1892); *Décentralisation et ses différents aspects* (1897); *Documents relatifs aux Etats généraux et assemblées réunies sous Philippe le Bel* (1901); *L'Institut de France* (1907), in collaboration with the secretaries of the four other academies.

PICPUS (pēk'pus') **SOCIETY**. The name commonly used for a religious community in the Roman Catholic church officially styled the Congregation of the Sacred Hearts of Jesus and Mary and of the Perpetual Adoration. It was founded in 1805 by Pierre Joseph Coudrin and confirmed by Pius VII in 1817. Its mother house was in the Rue Picpus in Paris, whence the colloquial name. The society was founded to carry on religious and moral education. In 1825 the Catholic work in the Sandwich Islands was given to it, and now it devotes itself to missionary work, especially in eastern Oceania and South America. The mother house is in Louvain, Belgium. In the United States are two houses—at Fairhaven, Mass., and Olema, Cal. Consult: A. Coudrin, *Vie de l'abbé Coudrin* (Paris, 1846); E. Keller, *Les congrégations religieuses en France* (ib., 1880); S. Peron, *Vie de Pierre Marie Joseph Coudrin* (ib., 1900).

PICQUART, pē'kār', MARIE GEORGE (1854-1914). A French general, born at Strassburg. He studied at the military school of Saint-Cyr from 1872 to 1874 and served in Algeria, becoming captain in 1880. In 1896, while Picquart, then a major, was in charge of a bureau in the War Office, a paper came into his hands which bore the signature of Major Esterhazy. It corresponded exactly to the Dreyfus (q.v.) *bordereau*. During the struggle of two factions, one to bring to light and one to suppress the truth, Major Picquart, who had shown an honest desire to get the real facts of the matter, was made a lieutenant colonel and sent away on special service. In 1898, as a witness in the new Dreyfus trial, he stood out against the general staff.

He was then retired and imprisoned for one year. After the final revision of the case he was by special decree named brigadier general in 1906. From this year to 1909 he was Minister of War in the Clemenceau cabinet. Picquart was buried with full military honors.

PICRIC ACID (from Gk. *πικρός*, *pikros*, bitter), or **CABAZOTIC ACID**, $C_6H_3(NO_2)_3OH$. One of the first organic dyes that have been prepared by artificial processes. It is derived from carbolic acid, or phenol, by the action of nitric acid, and is therefore called also trinitrocarbolic acid or *trinitrophenol*. It is best prepared by dissolving carbolic acid in strong sulphuric acid and gradually adding nitric acid; after the violent action has subsided, the mixture is kept for about two hours at a gentle heat, so as to complete the reaction. Picric acid separates out in the form of yellow crystals from the solution thus obtained and may be purified by crystallization from hot water, in which it is moderately soluble. The substance is also formed by the action of nitric acid on many organic products, such as wool, leather, silk, indigo, resins, etc. While it is but sparingly soluble in cold water, it readily dissolves in organic liquids like ordinary alcohol, ether, benzene, etc. It melts at $122.5^\circ C.$ ($252.5^\circ F.$). Its solutions have a strongly bitter taste and stain the skin as well as wool and silk a bright yellow. Formerly picric acid was much used as a dye. Since vegetable fibres are not colored by it, it may be used to detect cotton mixed in with wool. At present picric acid is used extensively for the manufacture of certain explosives. Large exportations from the United States to the European countries at war were made in 1915. The substance itself burns quietly if ignited; but its alkali derivatives, the *picrates* of sodium, potassium, and ammonium, explode when heated, with great violence. It is mostly these derivatives of picric acid that are employed in the manufacture of explosives. The explosives, however, known as *melinite*, *lyddite*, and *shimose*, consist mainly of the free acid (mixed with gun cotton). Formerly the acid was largely used in the manufacture of smokeless powder. Picric acid is said to have been employed also as a substitute for hops in the manufacture of beer. In organic chemistry picric acid is classed with the phenols, being a benzene derivative containing the hydroxyl group (OH). Unlike most other phenols, however, it is more strongly acid than carbonic acid, from the combinations of which (the carbonates) it is capable of taking away the alkali metals to form picrates. These strongly acid properties of picric acid (trinitrophenol) are due to the presence of nitro groups (NO_2) in its molecule.

PICROTOXIN (from Gk. *πικρός*, *pikros*, bitter + *τοξικόν*, *toxikon*, poison, originally that in which arrows were dipped, neut. sing. of *τοξικός*, *toxikos*, relating to a bow, from *τόξον*, *toxos*, bow), either $C_{20}H_{14}O_{13}$ or $C_{18}H_{12}O_{10} \cdot H_2O$. The active poisonous principle contained in the seeds of *Anamirta paniculata*, which grows in the East Indies. It may be obtained from the seeds by extraction with hot alcohol and may be purified by crystallization. It forms colorless needle-like crystals that are very soluble in alcohol and moderately soluble in ether and in chloroform. The substance is extremely poisonous. It is sometimes used externally as a parasiticide and internally to check night sweating in phthisis.

PICTAVI. See **PICTONES**.

PICTET, *pék'tá'*, *Amé* (1857-). A Swiss chemist. He was born at Geneva, where he was educated at the university and where, after studying at Dresden, Bonn, and Paris (D.Sc., 1881), he became instructor in 1882, associate professor in 1894, and full professor in 1899. Pictet is author of the important monograph entitled *La constitution chimique des alcaloïdes végétaux* (1888; 2d ed., 1897; Ger. trans., 1891; Eng. trans. as *The Vegetable Alkaloids with Particular Reference to their Constitution*, 1904).

PICTET, *RAOUL* (1842-). A Swiss physicist and chemist. He was born at Geneva and served as professor in the university of that city. He has devoted himself largely to problems involving the production of low temperatures and the liquefaction and solidification of gases. (See **LIQUEFACTION OF GASES**.) By using extreme cold and pressure he ascertained in 1877 that oxygen, nitrogen, and hydrogen could be liquefied, making this discovery about the same time as Cailletet (q.v.) in Paris, who employed an altogether different method. Pictet is the author of *Mémoire sur la liquéfaction de l'oxygène, la liquéfaction et la solidification de l'hydrogène et sur les théories des changements des corps* (1878); *Synthèse de la chaleur* (1879); *Nouvelles machines frigorifiques basées sur l'emploi de phénomènes physicochimiques* (1895); *Etude critique du matérialisme et du spiritualisme par la physique expérimentale* (1896); *L'Acétylène* (1896); *Le carbide* (1896); *Zur mechanischen Theorie der Explosivstoffe* (1902); *Die Theorie der Apparate zur Herstellung flüssiger Luft mit Entspannung* (1903).

PIC'TON. A town and the county seat of Prince Edward County, Ontario, Canada, situated on the Bay of Quinte and on the Canadian Northern Railway, 103 miles east of Toronto by rail (Map: Ontario, H 5). Steamers connect it with Rochester, Kingston, Belleville, Toronto, and Montreal. It manufactures foundry and machine-shop products, lumber products, canned fruit, butter, boats, and bricks. Pop., 1901, 3698; 1911, 3564.

PICTON, *SIR THOMAS* (1758-1815). A British general, born at Poyston, Pembrokeshire. After going to the West Indies in 1794, he distinguished himself in the taking of St. Lucia and St. Vincent from the French and Trinidad from the Spaniards, and was made military governor of Trinidad in 1797. He restored order there and made many improvements and in 1801 was made brigadier general and civil governor of the island. The severity of his rule caused complaint, and he was superseded in 1803, but was made commandant at Tobago. He was recalled to England to answer charges against his Trinidad administration, but was honorably acquitted and as major general (1808) went to serve at Flushing. He commanded the Third Division under Wellington and was with him throughout the Peninsular campaigns and fought in all the leading battles. He was promoted to the rank of lieutenant general in 1813, after Napoleon's escape from Elba was summoned to join Wellington again in the Netherlands, fought and was wounded at Quatre Bras, and was killed in the battle of Waterloo, while leading his brigade. A monument to him was erected in St. Paul's Cathedral, London.

PIC'TONES, *pik'tón-éz*, or **PICTA'VI**. An ancient tribe in Gaul whose name survives in

Poitiers, the capital of the Department of Vienne. They are mentioned by Cæsar with the Senones, Parisii, Carduci, Turones, Aulerici, and Lemovici in the combination against the Romans organized by Vercingetorix. The chief interest in them is the belief that they were Iberians and probably blood kindred of the Picts in Scotland. On the strength of this connection and a resemblance in physical characteristics, Rhys, an eminent authority, applies the title Ibero-Pictish to the pre-Celtic long-heads in Britain. In Cæsar's time the language of the Pictones was Gaulish, but originally they spoke Iberian. Consult A. H. Keane, *Man: Past and Present* (New York, 1899).

PICTOU, pik-too'. The capital of Pictou County and a port of entry on Pictou Harbor, Northumberland Strait, the north coast of Nova Scotia, Canada, 113 miles north-northeast of Halifax (Map: Nova Scotia, H 5). It is in a fertile and well-cultivated district, with extensive coal mines and quarries of building stone. It is on the Intercolonial Railway, which ships there for Prince Edward Island. The harbor is safe and well equipped. The chief building is the Pictou Academy, founded in 1818. The industrial establishments include manufactories of flour and feed, biscuits, motor boats, tobacco, candy, and woodwork products. The town, which is a seaside resort, dates from 1763 and replaced an Indian village. The United States is represented by a consular agent. Pop., 1901, 3235; 1911, 3179.

PICTS. An ancient people of the Stone age (Long Barrow period), inhabiting the whole of Great Britain. They were dolichocephalic and of rather low stature (5 feet, 5 inches), dark in complexion, and are supposed to have been Iberians or, according to Sergi, long-headed Mediterraneans from Africa speaking Celtic. They were supplanted or incorporated by the succeeding Teutonic invasions in the primitive period of the English nation. The name originated from the custom of the Picts of staining or tattooing the skin. It is pretty generally agreed by scholars that the southern Welsh, the Ffirbolgs (q.v.) of western Ireland, and perhaps the short and dark remnants in Scotland represent survivals of the Picts. The language is not only extinct, but it has left no literature and only scant traces in place names. Concerning their history nothing definite is known until 297 A.D., when we find the name Picti used by the orator Eumenius. They called themselves Cruithnigh (q.v.) and occupied at that period the north and the centre of the Highlands. The Romans waged continuous war with the Picts and built large walls to keep them out of the conquered provinces. The Saxons at first did not come into contact with this race, but as they pushed farther northward they also encountered the Picts and in 685 were defeated by their King, Brude. After this a continuous border warfare was carried on with varying results. Gradually the Picts were converted to Christianity, and their King, Angus MacFergus (731-761), ruled over the whole of Scotland. Soon thereafter this race disappeared as a separate entity, and in the middle of the ninth century Kenneth MacAlpine, as King of the Scots, ruled over all the different races. It must be stated that concerning nearly everything that pertains to the Picts long disputes have been carried on by scholars. Consult: W. F. Skene, *Chronicles of the Picts and Scots*

(Edinburgh, 1867); id., *Celtic Scotland* (3 vols., ib., 1878-80); Rhys and Brynmor-Jones, *The Welsh People* (New York, 1900).

PICTS' HOUSES. The small stone houses built underground in Scotland probably as places of concealment during wars or other dangers, and the chambered tumuli found in the north of the British Isles, of which Mousa and Maeshow, in the Orkneys, are types. In tradition they have been attributed to the Picts.

PICTURED ROCKS. A series of sandstone cliffs, 300 feet in height, stretching for 5 miles along the shore of Lake Superior, about 45 miles east of Marquette.

PICTURES, MOVING. See MOVING PICTURES.

PICTURES, RESTORATION OF. See RESTORATION OF PAINTINGS.

PICTURE WRITING. See HIEROGLYPHICS.

PICUDA, pi-koo'da. The largest and most voracious of the barracudas (q.v.), of which several species inhabit the American tropical seas. The great barracuda, *picuda*, or *becuna* (*Sphyræna picuda*) reaches a length of 6 feet and is highly valued as food. It is silvery in color, with dark blotches along the sides, and has some inky spots. Other species are known as *picudilla*, *guaguanche*, *spet*, etc., and the larger ones are sometimes dangerous to bathers, attacking them as fiercely as a shark.

PICULET (dim. of *picule*, from Lat. *picus*, woodpecker). Any one of a group of about 30 species of tropical birds, which form a sub-family (Picumninæ) of woodpeckers. They are small, plainly colored, usually marked with black, and with red or yellow on the head, and differ from typical woodpeckers in having short rounded tails without spinous shaft tips, and the nostrils hidden by bristles. Most of them are Central and South American birds. See Plate of WOODPECKERS.

PICURIS, pé-koo'ris. See TANOAN STOCK.

PICUS. A legendary king of Lavinium, father of Faunus and grandfather of Latinus. He was a prophet, a warrior, and a statesman. Because he rejected her love, the sorceress Circe (q.v.) changed him to a woodpecker (Lat. *picus*). Consult Vergil, *Æneid*, vii, 170-191, and Ovid, *Metamorphoses*, xiv, 320-402. The whole story is late and may have arisen from a folk-tale about the woodpecker, a bird sacred to the great god Mars. *Picus* was a deity also of agriculture, especially connected with the artificial fertilizing of the soil.

PIDAL, pé-däl'. See MENÉNDEZ PIDAL.

PIDAL, PEDRO JOSÉ, first MARQUIS DE (1800-65). A Spanish statesman and scholar, member of a noble Asturian family. He served as soldier, deputy in the Cortes, Senator, President of the Cortes, Minister in charge of various portfolios, and Prime Minister. Pidal was a member of the Royal Spanish Academy of the Language, director of the Royal Academy of History, and president of the Royal Academy of Moral and Political Sciences. He received his title of Marquis from Isabella II in 1848.

PIDAL, RAMÓN MENÉNDEZ. See MENÉNDEZ PIDAL, RAMÓN.

PIDAL Y MON, é môn, ALEJANDRO (1847-1913). A Spanish statesman, scholar, and orator, younger son of the first Marquis de Pidal. He served as deputy, member of the Constituent Cortes of 1876, President of the Cortes, and Minister of Public Works. He was a member of the Royal Spanish Academy of the Language (serving as its director from 1907 until his

death), of the Royal Academy of Moral and Political Sciences, of the Royal Academy of History, and of the Madrid Academy of Jurisprudence and Legislation (of which he was president in 1895-98).

PIDAL Y MON, Luís, second MARQUIS DE PIDAL (1842-1913). A Spanish statesman, scholar, and diplomat, son of the first Marquis de Pidal. He served as a deputy in the Cortes (of which he became Secretary), as Ambassador to the Pope, life senator, President of the Senate, President of the Council of State, and Minister of Public Works. He was a member of the Royal Spanish Academy of the Language, of the Royal Academy of Moral and Political Sciences, and of the Academy of Fine Arts of San Fernando. His reforms in education were criticized as unscientific. As an orator and statesman he was a staunch defender of the religious orders.

PIDDIG, pē-dēg'. A town of north Luzon, Philippines, in the Province of Ilocos Norte (Map: Philippine Islands, C 1). It is situated on the Guisi River, 8 miles east of Laoag, with which it is connected by wagon road. Pop., 1903, 9172.

PIDDOCK (of uncertain etymology). A bivalve mollusk of the genus *Pholas*, related to the shipworms (q.v.). The shell is thin, white, very hard, and is beset with calcareous inequalities, connected by fine transverse parallel ridges, forming a kind of rasp, used by the animal for boring a hole in rock, wood, or other substances in which it lives. The animal itself is club-shaped, with large long siphons, united almost to the end, and a short foot. The shell is 2 or 3 inches in length, gaping at both ends and provided with two accessory valves. The siphons are two or three times as long as the shell and are extended to the opening of the hole in which the animal lives. Several species occur on the eastern coast of America, living buried in mud or clay. The commonest species is *Pholas truncata*, which lives in clay or peat banks between tides and burrows into them to a depth of a foot or more. A larger and finer species is *Pholas costata*, found only in deep water. Two or three species are used in Great Britain for bait and for food. In boring its hole the piddock fixes itself firmly by its foot and works itself from side to side, making use thus of the rasping power of its shell. See Colored Plate of CLAMS AND EDIBLE MUSSELS.

PIDGIN, pj'ɪn (Chin. corruption of Eng. *business*), or **PIGEON, ENGLISH**. A mixed language much in use in the ports of China, as a medium of oral communication between foreigners who cannot speak Chinese (merchants, sea captains, sailors, etc.) and such Chinese servants, shopkeepers, compradores, boatmen, etc., as they may have to converse with. It is also occasionally used by natives from different ports whose own dialects are so different as to be mutually unintelligible. It consists of a mixture of English words, mostly monosyllabic, with corrupted Chinese, Portuguese, Malay, and other terms and expressions, arranged according to Chinese idiom. These words are "uninflected" except to the extent that vowel endings such as *o* or *ee* are frequently added after certain consonants which the Chinese in common with the Japanese are unable to pronounce without a following vowel; e.g., *washēe* for "wash," *largee* for "large," *s'possee* for "suppose," *wifo* for "wife." Owing to the inability of the Chi-

nese to pronounce initial *r*, *l* takes its place, and "rice" becomes *lice*; "American" becomes *Melican*, "friend" becomes *fien*, and "try" becomes *tli*. Among the corrupted Chinese words are *bobbery*, noise, disturbance, abuse, scold (either noun or verb), as "you makee too muchee bobbery"; "how fashion you bobbery my?" *Chop* is a mark, brand, or device; *chop-chop* means "quick! make haste!" and the same *chop* occurs in *chopsticks* or "hasteners" used in eating. *Chow-chow* means "food" or "eat"; and *maskee* (probably of Malay or Portuguese origin), "never mind! no matter!" *Belong* takes the place of "be"; *my* is equivalent to "I," "me," "my," "mine" ("no belong my" = I didn't do it, or it is not mine). *Savey* means "know"; "not" is replaced by *no*, and the opening sentence of Hamlet's soliloquy, "To be or not to be! That is the question" is simply rendered by "Can do, no can do! How fashion?" *Joss-pidgin* means religious ceremony, and *Joss-pidgin man*, a priest, clergyman, or missionary. In the same way a tourist or sightseer becomes a *look-see man*, and "get" is expressed by *catchee*. Consult K. Lentzner, *Wörterbuch der englischen Volkssprache Australiens und der englischen Mischsprachen* (Halle, 1891).

PIDGIN, CHARLES FELTON (1844-). An American writer, statistician, and inventor, born at Roxbury, Mass. He received an academic education, was in the mercantile business in Boston in 1863-73, was chief clerk of the Massachusetts Bureau of Statistics and Labor in 1873-1903, and thereafter was chief of the bureau until 1907. Among his inventions for the mechanical tabulation of statistics are an electrical adding and multiplying machine, an addition register, a self-counting tally sheet, and the automatic multiple tabulating machine. He wrote the librettos for a number of musical comedies and cantatas and the words for more than 60 songs and published, among other works: *Practical Statistics* (1888); and the novels *Quincy Adams Sawyer* (1900; rev. ed., 1902), *Blennerrhasset* (1901), *Corsican Lovers* (1905), *Theodosia* (1907), *The Further Adventures of Quincy Adams Sawyer* (1909), *Chronicles of Quincy Adams Sawyer* (1912), with J. M. Taylor.

PIEDMONT, pēd'mōnt (It. *Piemonte*, country at the foot of the mountains). A compartimento of the Italian kingdom embracing the provinces of Turin, Cuneo, Alessandria, and Novara and bounded by Switzerland, France, Liguria, and Lombardy (Map: Italy, A 2). It has an area of 11,331 square miles. Pop., 1911, 3,424,450. In 1247 a partition of the territories of Savoy (q.v.) led to the establishment of the two related lines of Savoy and Piedmont. The rulers of the second line were made princes of the Empire in the early part of the fourteenth century. In 1418 the dynasty became extinct and the land reverted to Savoy. From 1797 to 1814 it was a part of France. It constituted the principal part of the former Kingdom of Sardinia (q.v.), which was not infrequently spoken of as the Kingdom of Piedmont. See ITALY.

PIEDMONT PLAIN. A name used in the physiography of the United States to designate that part of the Atlantic coast plain which lies between the Appalachian highland and the low coastal plain proper. It is distinguished from the latter topographically by being more rugged and eroded with deeper river valleys and

geologically by consisting of much older and harder rock strata. The change from the hard to the soft and recent formation is marked by a definite line of escarpments over which nearly all the Atlantic rivers fall in rapids or cataracts, and the line is known as the "fall line." The piedmont plain is less defined in New England than in the Southern States. It is narrowest and also approaches closest to the sea in New York and broadens southward, being about 300 miles wide in North Carolina.

PIED PIPER OF HAMELIN, THE. A poem by Robert Browning (1842), written for a child of Macready, the actor, on the old legend of the piper who agreed to rid the town of Hamelin of rats in 1284 and, because he was not paid, lured the village children by his playing to a cave in the mountain, where they disappeared.

PIEGAN, pē'gan. See BLACKFOOT.

PIEHL, pēl, KARL FREDRIK (1853-1904). A Swedish Egyptologist, born in Stockholm. He was docent in Egyptian languages at Upsala in 1881, became director of the Egyptian Museum in 1889, and in 1893 was appointed to a newly endowed chair of Egyptology. He traveled much in Europe and Egypt. In 1897 Piehl became editor of the *Sphinx*, a French periodical of Egyptian archaeology. His publications include: *Petites études égyptologiques* (1881); *Dictionnaire du papyrus Harris No. 1* (1882), the great work, *Inscriptions hiéroglyphiques* (3 vols, 1886-95); the popular works *Nilens Strander* (1895) and *Bilder från Egypten* (1896).

PIENZA, pē-ēn'tsā A town in the Province of Siena, Italy, 25 miles southeast of Siena (Map: Italy, C 3). It is interesting because of the extant examples of early Renaissance architecture. The chief of these are the cathedral, with an ecclesiastical museum attached, the Palazzo Pubblico, and the Palazzo Piccolomini. Pop (commune), 1901, 3864, 1911, 3945.

PIEPOWDER, pī'pou'dēr, COURTS OF (also *piepoudre, piedpoudre*, from OF *piepoudroux*, peddler, dusty foot, from *pied*, foot + *poudre*, powder, dust). In mediæval England, inferior courts of limited jurisdiction, instituted for the speedy trial of commercial disputes, arising at fairs and public markets. The name was probably applied to the court from the circumstance that the litigants generally were peddlers and tradesmen who traveled from one fair to another—persons with "dusty feet." Its jurisdiction was extended in some counties to include whole towns or boroughs. This court has fallen into disuse, though it seems never to have been expressly abolished.

PIER. See BRIDGE, CLUSTERED PIER; DOCK; FOUNDATION; HARBOR, WHARF.

PIER, ARTHUR STANWOOD (1874—). An American author, born in Pittsburgh and a graduate of Harvard (1895). After 1896 he was assistant editor of *The Youth's Companion*. An excellent writer of boys' stories, he was honored with membership in the National Institute of Arts and Letters. Among his books may be mentioned: *The Pedagogues* (1899); *The Sentimentalists* (1901); *The Triumph* (1903); *Boys of St. Timothy's* (1904); *An Ancient Grudge* (1905); *Harding of St. Timothy's* (1906); *The Young in Heart* (1907); *The New Boy* (1908); *The Crashaw Brothers* (1910); *The Jester of St. Timothy's* (1911); *The Story of Harvard* (1913); and, in a very different vein, *Women we Marry* (1914).

PIERANTONI, pyā'rān-tō'nē, AUGUSTO

(1840-1911). An Italian jurist, born at Chieti, Italy. He studied at Naples, became a volunteer in Garibaldi's army in 1860, was connected with the Ministry of Education at Naples and later at Turin, and served in the war against Austria after 1866. He held the chair of international law at Modena (1865-66), at Naples (1870-76), and thereafter at Rome. In 1883 he was chosen Senator of the Kingdom. Pierantoni published many works on international law, of which *Il progresso del diritto pubblico e delle genti* (1866) and *Storia degli studi del diritto internazionale in Italia* (1869; 2d ed., 1902) were translated into German.

PIERCE, pērs, FRANKLIN (1804-69). The fourteenth President of the United States. He was the son of Gen. Benjamin Pierce, a soldier of the Revolution and twice Governor of New Hampshire, and was born at Hillsborough, N. H., Nov. 23, 1804. He graduated in 1824 at Bowdoin College, where he formed a lifelong friendship with Nathaniel Hawthorne and had among his other college mates John P. Hale, S. S. Prentiss, and Henry W. Longfellow. After leaving college he studied law in the law office of United States Senator Levi Woodbury, also in offices at Northampton, Mass., and at Amherst, N. H., and was admitted to the bar in 1827. Two years later he took a seat in the State House of Representatives as a Democrat. He was thrice reelected and for two terms served as Speaker. In 1832 he was elected a Representative in Congress and was reelected in 1834. In 1837 he was elected to the United States Senate, and when he took his seat he was the youngest member of that body. As a member of Congress he supported by his speeches and votes the policy of President Jackson. He opposed appropriations for the Military Academy at West Point, the renewal of the United States Bank charter, and the policy of internal improvements and was averse to the spoils system. In 1842, before the expiration of his term as Senator, he resigned and resumed his law practice, settling in Concord, N. H. He successively declined an appointment to fill a vacancy in the Senate, refused the nomination for Governor of New Hampshire, would not accept the office of Attorney-General of the United States tendered by President Polk, and announced it as his fixed purpose never again to accept public office. He did not, however, cease to take interest in public affairs and during his retirement took an active part in the councils of his party, openly advocated the annexation of Texas, and took the stump against his former college mate, John P. Hale (q.v.), the successful Antislavery candidate for the United States Senate. Upon the outbreak of the Mexican War Pierce promptly volunteered as a private soldier. He was soon appointed colonel, and in March, 1847, received a commission from the President as brigadier general of volunteers. He at once sailed for Vera Cruz and joined General Scott in time to participate in the battles of Contreras and Churubusco. In the former engagement he was thrown from his horse, but, although painfully injured, he refused to leave the field. Upon the conclusion of peace he resumed his law practice, which was again interrupted in 1850 by his election as a delegate to the New Hampshire Constitutional Convention, over the deliberations of which he was chosen to preside by an almost unanimous vote. At the Democratic National Convention, held at Baltimore in June,

1852, he was brought forward, after 35 ballotings, as a compromise candidate for the presidency and was nominated on the forty-ninth ballot, defeating Buchanan, Douglas, Cass, and Marcy. On account of his personal popularity and his conservative position with regard to the slavery question, General Pierce was able to draw to his support a large number of voters in the North, among them many Whigs, and consequently defeated General Scott, the Whig candidate, by a vote of 254 to 42. He carried every State except Massachusetts, Vermont, Kentucky, and Tennessee and received a larger electoral vote than had ever before been cast for a presidential candidate. He chose a strong cabinet: William L. Marcy, Secretary of State; Jefferson Davis, Secretary of War; James Guthrie, Secretary of the Treasury; James C. Dobbin, Secretary of the Navy; Robert McClelland, Secretary of the Interior; James Campbell, Postmaster-General; Caleb Cushing, Attorney-General. This is the only cabinet in the history of the country that did not suffer a break during the presidential term. The chief events of Pierce's administration were the Gadsden Purchase (q.v.), the Koszta affair (q.v.), the conclusion of commercial treaties with Great Britain and Japan, the bombardment of Greytown, Nicaragua, the reorganization of the diplomatic and consular service, and the creation of a United States court of claims. In the matter of foreign relations the administration was quite successful. As regards the slavery question the policy of President Pierce, who was concerned chiefly about the preservation of the Union and cared little about the abolition of slavery, caused much discontent in the North. The chief events under this head were the promulgation of the Ostend Manifesto (q.v.) and the enactment of the Kansas-Nebraska Bill (q.v.), which brought on strife between the proslavery and free-State settlers in Kansas. From 1855 to the end of Pierce's term the chief problem was that of governing Kansas and maintaining peace therein—a matter in which the President supported the proslavery party. Upon the expiration of his term Pierce traveled for several years in Europe, taking no further part in politics. He died Oct. 8, 1869. A monument was erected to him at Concord, N. H., in 1914. Consult two "campaign" biographies, published in 1852, written by Nathaniel Hawthorne (Boston) and D. W. Bartlett (Auburn); also J. E. Cooley, *Review of the Administration of General Pierce* (New York, 1854); A. E. Carroll, *Review of Pierce's Administration* (Boston, 1856); J. R. Irelan, *History of the Life, Administration, and Times of Franklin Pierce* (Chicago, 1888); J. F. Rhodes, *A History of the United States from the Compromise of 1850*, vol. i (New York, 1901); "Some Papers of Franklin Pierce," published in the *American Historical Review*, vol. x (ib., 1904-05); T. C. Smith, *Parties and Slavery* (ib., 1906). See UNITED STATES.

PIERCE, GEORGE FOSTER (1811-84). A bishop of the Methodist Episcopal Church South. He was born in Green Co., Ga., the son of Lovick Pierce. He studied law, but entered the Georgia conference of his denomination in 1831. Pierce was president of Georgia Female College, Macon (1839-42), and president of Emory College, Oxford, Ga. (1849-54). In 1854 he was elected Bishop. His sermons and addresses were edited and published by Bishop A. G. Haygood (1886).

PIERCE, LOVICK (1786-1879). A minister of the Methodist Episcopal Church South, father of George Foster Pierce. Born in Halifax, Co., N. C., he entered the South Carolina conference of his denomination in 1805, though he had begun to preach the year before, and was chaplain in the army during the War of 1812. At the close of the war he retired from the ministry and studied and practiced medicine, but, returning to his first profession in 1823, he had various important charges and represented his conference in numerous general conferences.

PIERIDÆ, pî-êr'î-dê. A family of butterflies noted for mimicry. See MIMICRY.

PIERIDES, pî-êr'î-dêz (Lat., from Gk. Περίδες). 1. A name given to the Muses from their birthplace, Pieria in Thessaly. 2. According to late mythology, the nine daughters of Pierus, King of Emathia, a district in Macedonia, whom he named after the nine Muses. When they were defeated by the Muses in a musical contest, they were changed into magpies.

PIERNÉ, pyâr'nâ', GABRIEL (1863-). A French composer and orchestral conductor, born at Metz. He graduated at the Paris Conservatory, where he won many important prizes, including the Prix de Rome in 1882. He became organist at Sainte-Clothilde in 1890, succeeding César Franck, and subsequently devoted himself chiefly to composition. He wrote the grand operas *Salomé* (1895) and *Vendée* (1897); the comic opera *Le docteur Blanc* (1893), *La coupe enchantée* and *La princesse Loiraine* (1895); several operettas and incidental music to plays; the oratorios *Les enfants de Bethléhem* (1907) and *St. François d'Assisi* (1913); the choral works *Pandora* and *Croisade des enfants*, a choral symphony *L'An mil*; and orchestral suite *La nuit de Noël de 1870*; a piano concerto in C minor, chamber music and songs.

PIERO, NICCOLO DI. See NICCOLO OF AREZZO.
PIERO DELLA FRANCESCA. See FRANCESCA, PIERO DELLA.

PIERO DI COSIMO, pyâr'ô dê kô-zê-mô (1462-1521). A Florentine painter of the Renaissance. He was a pupil of Cosimo Rosselli, from whom he derived his name and whom he assisted in painting the frescoes in the Sistine Chapel, where "The Destruction of Pharaoh's Host" is ascribed to him. Afterward the influence of Leonardo da Vinci becomes apparent in his works, which are characterized by bizarre and romantic imagination, dry color, and occasional breadth of design. Among the most remarkable are: "Perseus Delivering Andromeda," Uffizi, Florence; "Holy Family," Dresden; "Venus with Cupid and Mars," Berlin; "Coronation of the Virgin," Louvre; "Death of Procris," National Gallery, London. He is represented in the Jarves collection, Yale University, the Metropolitan Museum, New York, and the Johnson collection, Philadelphia. A special feature of his pictures is the fine landscape backgrounds. His principal pupils were Fra Bartolommeo and Andrea del Sarto. For his biography, consult Fritz Knapp, *Piero di Cosimo* (Halle, 1899).

PIEROLA, pè'a-rô'lâ, NICHOLAS DE (1839-1913). A Peruvian politician, born at Camaná. He was educated for the law and served as Minister of Finance during Balta's administration (1869-72). He was implicated in the revolts against Prado in 1874 and 1877, and when in the war with Chile Prado deserted his post, Pierola assumed the leadership of the revolution and was proclaimed supreme chief at Lima,

in the closing days of 1879. In 1881 he was defeated and was obliged to retire into the interior. Four years later he made an unsuccessful attempt to seize the presidency and was banished in consequence. In 1894 he headed another revolt, overthrew President Cáceres, was himself elected President in 1895, and held the office until the expiration of his term, Sept. 10, 1899.

PIERPONT, FRANCIS HARRISON (1814-99). An American political leader, born in Monongalia Co., Va. (now West Virginia). He supported himself while studying and graduated at Allegheny College (Pennsylvania) in 1839. He began the practice of law at Fairmount, Va., about 1845. He was a pronounced Abolitionist and was an elector on the Whig ticket in 1848. After Virginia seceded, representatives from 40 western counties met in convention at Wheeling, June 11, 1861, organized the "Restored Government of Virginia," and elected him Governor. He was recognized by President Lincoln and raised troops for the Federal army. In the fall he was elected by the loyal people for the unexpired term of two years and then for a full term of four years. When West Virginia was admitted to the Union as a separate State in June, 1863, he removed his capital to Alexandria under the protection of the Federal army. When Richmond was evacuated, he removed there and acted as Governor of the entire State until 1868. He then returned to Fairmont and sat in the West Virginia Legislature in 1870. President Garfield appointed him collector of internal revenue, in which capacity he served until the consolidation of his district.

PIERPONT, JAMES (?-). An American mathematician. He graduated B.S. from Worcester Polytechnic Institute in 1886 and Ph.D. from the University of Vienna in 1894, and received the honorary degree of A.M. from Yale University in 1899 and that of LL.D. from Clark University in 1909. At Yale he was lecturer in mathematics in 1894-95, instructor in 1895-96, assistant professor in 1896-98, and thenceforth professor. Pierpont is author of *Lectures on the Theory of Functions of Real Variables* (1905); *The History of Mathematics in the Nineteenth Century* (1905); *Functions of a Complex Variable* (1914).

PIERPONT, JOHN (1785-1866). An American clergyman and poet. He was born in Litchfield, Conn., graduated from Yale College in 1804, and practiced law at Newburyport, Mass. After unsuccessful business ventures in Boston and Baltimore he studied theology at Harvard Divinity School and in 1819 was ordained pastor of the Hollis Street Unitarian Church in Boston. His advocacy of antislavery, temperance, and other reforms caused his withdrawal from that parish in 1845, after which he became pastor of Unitarian churches at Troy, N. Y., and Medford, Mass. In the Civil War he was appointed, though 76 years old, chaplain of a Massachusetts regiment, but was soon transferred to the United States Treasury Department. He published, among other volumes: *Airs of Palestine* (1816; republished and enlarged as *Airs of Palestine and Other Poems* in 1840) and *Anti-Slavery Poems* (1843). He was the grandfather of John Pierpont Morgan (1837-1913). Consult J. G. Wilson, *Bryant and his Friends* (New York, 1886), and A. A. Ford, *J. Pierpont* (Jamaica Plain, Mass., 1909).

PIERRE, pĕr. A city, the county seat of Hughes County and the capital of South Dakota,

situated near the centre of the State, about 120 miles (direct) southwest of Aberdeen, on the Missouri River and on the Chicago and Northwestern Railroad (Map: South Dakota, D 3). It has the State library, a government industrial school for Indians, a Federal courthouse, United States land office, State capitol, Carnegie library, a fine Federal building, St. Mary's hospital, and good schools. A million-dollar railroad bridge crosses the river at this place. Pierre is the centre of an extensive stock-raising and farming district, and it is the largest stock market in the State. Underlying the city are supplies of natural gas, which is used for lighting and heating and for industrial purposes. Pierre was settled in 1880 and incorporated three years later. It is governed by a mayor and four commissioners. The water works, gas plant, and electric-light plant are owned by the municipality. Pop., 1900, 2306; 1910, 3656.

PIERRE D'AUBUSSON. See AUBUSSON, PIERRE D'.

PIERRE DE MONTEREAU. See MONTEUIL, PIERRE DE.

PIERREPONT, pĕr'pōnt, EDWARDS (1817-92). An American lawyer and diplomat, born at North Haven, Conn. He graduated at Yale in 1837, was admitted to the bar in 1840, and practiced at Columbus, Ohio, until 1845, when he removed to New York. He was elected judge of the Superior Court, New York, in 1857, but resigned in 1860 and resumed his practice. In 1867 he conducted the case for the government against John H. Surratt, indicted as an accomplice in the murder of Lincoln. Appointed United States district attorney by President Grant in 1869, he resigned a year later and then took an active part as one of the Committee of Seventy in fighting the Tweed ring. He was appointed Attorney-General of the United States in 1875 and in 1876-77 was Minister to the Court of St. James. He published several pamphlets on financial questions.

PIERROT, pyä'rō'. A character of French comedy from the Italian Pedrolino of the *commedia dell'arte*. Towards the beginning of the eighteenth century he appeared on the French stage in parodies at the Opéra Comique and other theatres. The Pierrot of the pantomime was introduced by Debureau at the Funambules and reappeared with the revival of the pantomime at the end of the nineteenth century. See HABLEQUIN.

PIERSON, pĕr'son, ABRAHAM (c.1645-1707). An American educator. He was born at Lynn, Mass., graduated at Harvard in 1668, became assistant pastor to his father at Newark in 1672, and was in sole charge of the New Church from 1678 to 1692. He then preached for two years in Greenwich, Conn., became pastor at Killingworth, Conn., in 1694, and from 1701 until his death was the first president, or rector, of Yale College. See YALE UNIVERSITY.

PIERSON, ARTHUR TAPPAN (1837-1911). An American Presbyterian minister, born in New York City. Graduating at Hamilton College in 1857 and at Union Theological Seminary in 1860, he was pastor of Congregational churches at Binghamton, N. Y., in 1860-63, and at Norwalk, Conn., in 1863. Subsequently he had charge of Presbyterian churches at Watford, N. Y. (1863-69), Detroit (1869-82), Indianapolis (1882-83), and Philadelphia (1883-91). Dr. Pierson occupied the pulpit of the

Metropolitan Tabernacle, London, from 1891 to 1893 and that of Christ Church in the same city for two periods (1902-03, 1907-08). From 1888 he was editor of the *Missionary Review of the World*. His writings include: *Many Infallible Proofs* (1886); *Keys to the Word* (1888); *The Inspired Word* (1890); *Divine Enterprise of Missions* (1891); *New Acts of the Apostles* (1894); *Stumbling Stones Removed* (1896); *Forward Movements of the Last Half Century* (1900); *Seed Thoughts for Public Speakers* (1901); *The Modern Mission Century* (1901); *The Making of a Sermon* (1904; 2d ed., rev., 1907); *God's Living Oracles* (1904); *Bible and Spiritual Criticism* (1906); *The Bible and Spiritual Life* (1908). Consult J. K. Maclean, *Dr. Pierson and his Message* (New York, 1911), and D. L. Pierson (q.v.), *A Spiritual Warrior*—Arthur Tappan Pierson (ib., 1912).

PIERSON, DELAVAN LEONARD (1867-). An American religious journalist. Born at Waterford, N. Y., he graduated from Princeton in 1890 and from Princeton Theological Seminary four years later. As early as 1884 he had become identified with editorial work. From 1891 to 1911 he was managing editor of the *Missionary Review of the World* and thenceforth was editor in chief. In 1894-1904 he also served as editor of *Northfield Echoes*, and he was editorial writer for the *Record of Christian Work* after 1905 and for the *Sunday School Times* after 1907. Pierson is author of *For Each New Day* (1896); *The Pacific Islanders* (1906); and a biography of his father, Arthur Tappan Pierson (q.v.).

PIERS (pěrs or pěrz) **PLOWMAN**. See **LANGLAND, WILLIAM**.

PIERS PLOWMAN'S CREDE. An alliterative poem, written about 1394 by an unknown poet whom Skeat identifies with the author of the *Plowman's Tale*. An ignorant man, wanting to learn his creed, applies to friars for help. They merely show their greed and jealousy of one another, and the creed is taught at last by a poor plowman. See **LANGLAND, WILLIAM**.

PIESTRE, pyēs'tr', **FERNAND**. See **COBMON, FERNAND**.

PIETÀ, pyà-tà'. Bemoaning of the dead Christ by his Mother, a favorite subject of Christian art. The incident occurred just after the deposition and before the entombment and is represented as occurring at the foot of the cross. The Maries and the other holy personages who participated in the entombment are usually added. In the Latin church the Virgin is represented sustaining the head of Christ in her lap, while the Magdalene laments at his feet. The incident was often depicted in Byzantine art, and nearly all great Italian painters, beginning with Giotto in the Arena Chapel, represented it. Among the principal were: Ambrogio Lorenzetti (Siena Academy); Fra Angelico (San Marco, Florence); Perugino (Pitti Palace, Florence Academy); Botticelli (Munich); Francia (London); often by Crivelli (Metropolitan Museum, New York); Mantegna and Giovanni Bellini (Brera, Milan); Fra Bartolomeo (Pitti Palace), wonderfully profound in religious feeling; Correggio (Parma Gallery); and Titian (Venice Academy). The Pietà was also represented in the same spirit of profound religious feeling by early Netherlandish and German painters, like Rogier van der Weyden (Berlin), Quinten Matsys (Antwerp), and Schongauer and Dürer in engrav-

ings. The representation of the subject did not improve in the late sixteenth and seventeenth centuries, when technical efficiency replaced religious feeling, as in Rubens (Brussels) and Van Dyck (Munich). It was often carved by Gothic sculptors of the late Middle Ages; a good French example is in the Metropolitan Museum, New York. Among Italian sculptors it was powerfully represented by Donatello (Padua, London) and by Michelangelo (St. Peter's, Rome). Consult the bibliography of **JESUS CHRIST IN ART**.

PIETAS (Lat., devotion to duty, in all its phases). In Roman mythology, the goddess of loyalty, especially of filial devotion. She is symbolized by the stork. As an abstract quality, signifying devotion to duty in all the varied relations of life, *pietas* figures largely in Latin writers, especially in the *Aeneid* of Vergil, who repeatedly calls Aeneas *pius*. Consult W. W. Fowler, *The Religious Experience of the Roman People* (London, 1911).

PIETER DE KEMPENEER, pē'tēr de kēm'-pe-nār. See **KEMPENEER, PETR DE**.

PIETERMARITZBURG, pē'tēr-mār'its-bûrg. The capital of the British colony of Natal, South Africa, 40 miles by rail northwest of Durban, the chief port of the colony (Map: South Africa, K 7). It is well built, 2200 feet above sea level, and noted for its healthful climate. It has considerable trade and is the seat of an Anglican bishop. Its chief features are the government buildings, town hall, a fine park, botanical gardens, and bathing establishments; it has electric lighting. The town was founded by the Boers in 1839 and named after the two Boer leaders Pieter Retief and Geert Maritz. Pop., 1904, 31,199; 1911, 30,555 (14,737 whites, 7789 Asiatics, and the rest natives).

PIETISM (from *piety*, OF. *piete*, Fr. *piété*, from Lat. *pietas*, piety, from *pius*, pious). A name given in the latter part of the seventeenth century to a religious movement in Germany, distinguished by certain peculiarities of religious opinion and the manner in which these were manifested. The name is sometimes applied, though with less correctness, to similar tendencies of opinion, feeling, and conduct exhibited elsewhere. Pietism may be regarded as an exaltation of the importance of religious feeling and of the practical part of religion, with a corresponding depreciation of doctrinal differences and of outward ecclesiastical arrangements.

German pietism was the natural outcome of conditions existing in the seventeenth century. The Reformers had emphasized the efficacy of faith in Christ as the means of securing deliverance from sin. But the controversies which arose among them and increased among their successors gradually gave a too exclusively doctrinal and polemical character to the sermons and writings of both Lutheran and Calvinistic divines. When the inevitable reaction came it took form in favor of a religion of feeling and good works or of the heart and life. Johann Arndt (1555-1621), Johann Valentin Andreæ (1586-1654), both Lutherans, and Johannes Coccejus (1603-69), a Calvinist, may be regarded as forerunners of pietism. But its full development is to be ascribed to Philipp Jakob Spener (q.v.) and his friends and disciples, particularly the Leipzig doctores, Paul Anton, J. K. Schade, and August Hermann Francke. It began with private devotional meetings in

the house of Spener (*collegia pietatis*), whence the movement had its name. Driven from Leipzig by the opposition of the older school of theologians, Francke and Anton found a refuge, through Spener's influence, in the newly founded University of Halle, and under their lead and that of their associates, Joachim Justus Breithaupt and Hermann Lange, Halle became the centre of the movement and a source of new religious life in Germany. Pietism also became dominant in the universities of Königsberg, Giessen, and Marburg and from north Germany spread to the south, where its head was Johann Albrecht Bengel, and even to other lands. Ultimately it went to excess, fantastic doctrines and fanatical practices came to prevail, and the rationalism of the eighteenth century was the inevitable and healthful reaction. See GERMAN THEOLOGY, III; also articles under BENDEL, FRANCKE, SPENER, and other leaders.

PIET PAALTJENS, pēt pālt'yēns. See HAVERSCHMIDT, FRANÇOIS.

PIETRABONDANTE, pyā'trā-bōn-dān'tā. See BOVIANUM, 1.

PIETRA DURA, pyā'trā dōō'rā (It., hard stone). A name given to the finest kinds of Florentine mosaic work, in which the inlaid pieces, each cut to the shape of its bit of color in the pattern, are of hard stone, such as jasper, carnelian, amethyst, agate, etc. The real pietra-dura work dates as far back as to 1570 and from that time to the present has been almost confined to Florence, where a government atelier has existed ever since the beginning of the seventeenth century. In that century an inferior kind came into use, especially in Naples, where colored cements, made by crushing refuse bits of the hard stones, were substituted for the cut stone. When highly polished this sort can hardly be distinguished from the better kind. The art was carried by Italians to the Mogul courts of India, where it formed an important part of the decorative splendor of the palaces of Delhi and Agra and of the Taj Mahal (q.v.). The inferior kinds are at present manufactured in Derbyshire and other parts of Britain as well as in Italy.

PIETRAPERZIA, pyā'trā-pēr'tsā-ā. A town in the Province of Caltanissetta, Sicily, 7 miles southeast of Caltanissetta (Map: Italy, E 6). It has an old Norman fortress and carries on a trade in grain and almonds. There are sulphur and gypsum mines in the vicinity. Pop. (commune), 1901, 12,826; 1911, 12,190.

PIETRASANTA, pyā'trā-sān'tā. A town in the Province of Lucca, Italy, 15 miles northwest of Lucca by rail and 2 miles from the Mediterranean (Map: Italy, C 3). It is situ-

ated on a hill, on the top of which is a large fortress, and is surrounded by a wall. The fourteenth-century church of San Martino has fine choir stalls and a baptistry with bronze decorations by Donatello. The surrounding country is fertile, and the grape and olive are produced in abundance. There are marble quarries and quicksilver mines. Pop. (commune), 1901, 17,444; 1911, 19,868; (town) 8700.

PIETRO DELLA VALLE. See VALLE, PIETRO DELLA.

PIETRO DELLA VIGNA, pyā'trō dēl'la vē'nyā. See PETER DE VINEA.

PIETRO DE' MEDICI. See MEDICI, PIETRO.

PIETSCHMANN, pēch'mān, RICHARD (1851-). A German Orientalist and librarian. He was born at Stettin, studied in Berlin and Leipzig (Ph.D., 1874), and was librarian of several universities, but especially at Göttingen, where in 1889-90 he was also professor of Egyptology and Oriental history. He wrote: *Hermes Trismegistos* (1875); *Geschichte der Phönizier* (1889); *Geschichte des Inkarciches* (1906); and translations of Maspero's Oriental history (1877), and of the part dealing with Egypt in Perrot and Chipiez, *Histoire de l'art dans l'antiquité* (1884).

PIEZOMETER, piē-zōm-ē-tēr (from Gk. πιέζειν, piezein, to press + μέτρον, metron, measure). An instrument for measuring the compressibility of fluids, originally devised by Orsted (q.v.) in 1822, to determine the compressibility of water, mercury, alcohol, and other liquids. It consisted of a cylinder of thick glass closed at either end by a brass cap. A tube of glass or brass containing a piston or a screw plug was fitted to the upper cap, by means of which considerable pressure could be exerted on the liquid in the cylinder below. This cylinder was sufficiently large to contain a glass flask whose neck was drawn out into a fine tube, like that of a thermometer, graduated into equal divisions, each of which represented a certain fraction of the volume of the flask. When the piston was pushed or screwed down, the liquid in the cylinder was put under pressure. This pressure was communicated to the liquid in the flask, which was compressed by a small amount, as was shown by the rise of the mercury in the fine tube. Knowing the volume of the flask and the value of the divisions of the tube, the amount of compressibility was readily ascertained by the pressure shown by a manometer. Orsted found that the compressibility of water for one atmosphere of pressure amounted to 46.65 millionths. Colladon and Sturm, who performed a series of similar experiments, made this value 49.65 millionths, while Grassi somewhat later fixed the compressibility of water at 0° C. at 50 millionths, and at 53° C. at 44 millionths. With the piezometer it was also demonstrated that liquids are perfectly elastic, since when the pressure is removed the mercury sinks to its former position, showing that the liquid returns to its original volume.

PIFFARD, pif'ard, HENRY GRANGER (1842-1910). An American physician, born at Piffard, N. Y., a town founded by his father. He graduated from the University of the City of New York and in 1864 from the College of Physicians and Surgeons. At the former institution (which became New York University) he held the chair of dermatology from 1875 till his retirement in 1910. Piffard did

not restrict himself to dermatology, but was an original investigator in nearly every branch of medicine, was an accomplished microscopist, physicist, botanist, and investigator in therapeutics, and widely known as a linguist. He was the first in the United States to employ high-frequency currents scientifically and intelligently. During the last years of his life he devoted much study to the etiology of tuberculosis. He was a founder of the Dermatological Society and its president. Besides translating Dartrous's *Diatheosis* (1868), he published a number of works on dermatology and many important articles.

PIFFERARI, piff'a-rà-ré (It., pipers). The name given to shepherds of the Abruzzi who formerly flocked to Rome in the Advent season and collected gifts at the shrines of the Virgin, where they sang and played old airs on pipes and bagpipes.

FIG. See Hog; SWINE.

FIGAFETTA, pè'gá-fet'tà, (FRANCESCO) ANTONIO (1491-c.1534). An Italian traveler and historian, born at Vicenza. He was with Magellan's expedition of circumnavigation, of which he published the chief account (see Milan ed., 1800).

PIGALLE, pé'gál', JEAN BAPTISTE (1714-85). A French sculptor, born in Paris. He was a pupil of Robert le Lorrain and Lemoyne and then studied in Rome. In 1744 he was elected to the academy, where he became professor in 1752 and rector in 1777. His statuette "Mercury Fastening his Sandal," one of the gems of eighteenth-century art (replica in the Altman collection, Metropolitan Museum, New York); a "Child with Cage"; the busts of Marshal Maurice of Saxony (1750) and of the surgeon Guérin; and the group "Love and Friendship" are in the Louvre. Other works by him include: "Mercury," in the Berlin Museum; "Venus," at Potsdam; the monument to Louis XV, at Rheims (figure entirely new); a marble group of the "Queen of Heaven," in Saint-Sulpice, Paris; the tomb of the Comte d'Harcourt (partly destroyed, but restored) in Notre Dame, Paris; a statue of Voltaire in the library of the Institute; and his masterpiece, the tomb of Marshal Maurice of Saxony, in the church of St. Thomas at Strassburg. Pigalle possessed rare skill, grace, and fire, but he sometimes lacked moderation and often spoiled his larger works by complicated allegory. Consult Tarbé, *La vie et les œuvres de J. B. Pigalle* (Rheims, 1859).

PIGAULT-LEBRUN, pé'gô'-le-brün', CHARLES (1753-1835). A French novelist, whose real name was Pigault de l'Épiney. He was born at Calais and lived early in Paris, but left the capital because of escapades. In 1791 he enlisted and fought at Valmy. The next year appeared his first novel, *L'Enfant du Carnaval*; it had a tremendous success. He wrote also: *Les barons de Felsheim* (1798); *Angélique et Jeanneton* (1799); *Mon oncle Thomas* (1799); *Monsieur Botte* (1802), his best work. Pigault-Lebrun was the grandfather of Emile Augier (q.v.), who dedicated to him his drama *La ciguë* (1844). His wit was coarse, but often keen.

FIG DEER. See BABIRUSSA.

PIGEON, pij'un (OF. *pigeon*, *pipion*, Fr. *pigeon*, It. *picoione*, *pippione*, pigeon, from Lat. *pipio*, squab, young bird, from *pipire*, to chirp, onomatopoeic in origin). A name applied, like

dove (q.v.), to all members of the family Columbidae. Although members of the group differ greatly in size and color, with a few exceptions they are easily recognized. They are chiefly medium-sized or rather large birds. Most of those of temperate regions are plainly colored with gray, brown, or slate, and some black and white, but some of the tropical forms show brighter shades of blue and purple; while the fruit pigeons of the far Orient are gorgeous in green, yellow, orange, red, violet, and blue. The wings are usually long and pointed, the tail more or less elongated. The crop is large and double; during the breeding season it becomes glandular and secretes a milky fluid upon which the young are in part fed, or at any rate it moistens the food given them by their parents. The plumage of pigeons is generally very dense, quite smooth, often reflecting metallic lustres; the feathers entirely lack the aftershaft. Pigeons are monogamous, and the birds seem much attached to each other and share the labors of nest building, incubating, and caring for the young. The nests are always flimsy structures of a few twigs in a tree, and the eggs, almost always numbering two, are pure white. The young are naked and helpless when hatched. Pigeons are vegetarians and eat fruit, grain, seeds, and the like and are therefore often destructive in cultivated fields. Their notes are soft, low, and rhythmic—well described as "cooing." The flesh of most species is good eating, and they are ranked game birds and are much hunted. The flesh is nutritious; that of the young, or squabs, from 20 to 25 days old, is particularly delicate, and in some parts of the United States great numbers of domesticated doves are reared for market. On some farms upward of 10,000 squabs are sold annually to supply the demand for this delicacy.

More than 650 forms of pigeon are known, of which nearly or quite half are the so-called fruit pigeons of the East. The geographical distribution of the pigeons, living and extinct, suggests some of the most interesting inquiries in zoölogy. One interesting fact is that pigeons are usually absent from regions where monkeys abound, as these nimble thieves rob their open, unprotected nests so persistently that the two races cannot dwell in the same district. Fourteen species have been taken within the boundaries of the United States, but eight of these are West Indian or Mexican species, found only occasionally along the southern boundary. The remaining four are the little ground dove (q.v.); the common "mourning" or Carolina dove (*Zenaidura macroura*), abundant throughout temperate North America; the band-tailed pigeon (*Columba fasciata*), a large stout species, with a noticeable black bar across the bluish-ash tail, common from the Rocky Mountains to the Pacific; and the formerly very numerous "wild" or "passenger" pigeon.

The North American wild pigeon (*Ectopistes migratorius*) is especially interesting from the marvelous numbers composing its flocks before the settlement of the interior of the country caused its total disappearance. What was supposed to be the last survivor died in the Zoölogical Gardens in Cincinnati in the summer of 1914. The wild pigeon was a large slender bird, with a small head, notched beak, turned at the base, short strong legs with naked feet, a long acuminate tail, and long, pointed, and powerful wings. It was a beautiful bird, of graceful form

and finely colored plumage, and formerly was found in almost all parts of North America. It was not, properly speaking, a bird of passage, as apparently its movements depended on the failure of a supply of food in one locality and the necessity of seeking it in another. The nest of the passenger pigeon consisted of a few dry twigs placed in a fork of the branches of a forest tree and contained two eggs. They bred two or three times in a season. During the early part of the nineteenth century incredible numbers of pigeons were wont to roost at night and nestle in certain breeding places in the forests of the Mississippi valley, where sometimes 100 or more nests were often seen in a single tree. These great breeding places extended over a tract of forest, sometimes not less than 40 miles in length. Flocks of pigeons were often seen flying at a great height in dense columns, 8 or 10 miles long; and calculations made by careful observers agreed that in some of their great migrations the column, a mile broad, was more than 150 miles long. The roosting places were correspondingly extensive. The noise of wings and of cooing voices drowned the report of guns. The multitudes that settled on trees broke down great branches with their weight, so that it was dangerous to pass beneath. They crowded together, alighting one upon another, till they formed solid masses like hogsheads, and great numbers were killed by the breaking of branches. The inhabitants of the neighboring country would assemble, shoot them, knock them down with poles, stifle them by means of pots of burning sulphur, cut down trees in order to bring them in great numbers to the ground, eat them fresh, salt them, and bring hogs to fatten on them. Wolves, foxes, lynxes, cougars, bears, raccoons, opossums, polecats, eagles, hawks, and vultures congregated to share the spoils.

Such are the facts given by Wilson, Audubon, and the early historians of the West and abundantly verified. The disappearance of these birds, as soon as settlers began to invade and clear away the woods, was so rapid as properly to be called sudden, and it is not easily explained.

Of the pigeons of the Old World, the most interesting is doubtless the blue rock pigeon, or rock dove (*Columba livia*), the "biset" of the French, a bird of extensive geographical range. It is found as far north as the Faroe Islands and over the greater part of Europe, and breeds in crevices of rocks and often within caverns that open on the sea. In a wild state this bird exhibits great uniformity both in size and plumage; the prevailing color is bluish gray, with two distinct bars of black across the closed wings. It is commonly believed that domestic pigeons are all descended from this species, although possibly some were derived from the very similar *Columba intermedia*. The ordinary domestic pigeon differs from the wild chiefly in color, but it has a constant tendency to revert to the original coloring. There are 250 or more domestic breeds, and they have undergone many remarkable changes under the selective care taken by intelligent fanciers, who often pay very high prices for fine birds. Some of the varieties that exhibit very strange peculiarities are known as "fancy" pigeons and are carefully tended and preserved by pigeon fanciers. Of these may be mentioned, as among the most interesting, the rough-footed pigeon, having the feet feathered; the Jacobin, which has a range

of feathers inverted over the head and extending down each side on the neck, as a hood; the fan-tail, in which the number of the tail feathers is greatly increased and the bird has the power of erecting its tail like that of a turkey cock; the tumbler, so called from turning somersaults in the air in its flight and further characterized by a very short bill; the pouter or "cropper," which has the power of blowing up its crop to an extraordinary degree, so that the head seems fastened on the top of an inflated bladder; and the black nun.

None of these have the popular interest and value, however, of the carrier, homer or homing pigeon, which is trained to return to its home from great distances and is utilized for carrying messages in places where sometimes no other means of communication is available. This represents the highest example of pigeon development. This breed is of large size, about 15 inches long, and has the cere very large and carunculated, the eyes surrounded with a broad circle of naked red skin, and the wings reaching nearly to the extremity of the tail. Carrier pigeons are trained by being conveyed, when young, to short distances of a few miles from home and then let loose, the distance being gradually increased till the pigeon may be made to return accurately and swiftly from 500 to 600 miles away. Pigeons intended for this use must be brought from the place to which they are to return within a short period (not exceeding a fortnight) of their being let loose and at a time when they have young in their nest, their remarkable fecundity affording particular facilities for their employment in this way. The impulse of the bird is to return to its family with the utmost haste.

The use of carrier pigeons is very ancient in the Orient and was brought to the attention of Europe at the time of the First Crusade, when the Saracens were found to have the birds in regular use for the conveyance of information; and the Christian commanders employed falcons to chase and intercept this pigeon post on several occasions and on others caught the tired birds, substituted misleading messages for those they were carrying, and sent them on to deceive the enemy. Arabic writers attribute to the perfection of a system of pigeon posts elaborated by the Mohammedan sovereign Nureddin a large part of his success in welding together the scattered parts of his broad Empire. Although their use, publicly and as an amusement, continued, it was not until the Franco-Prussian War of 1870 that pigeons were again of conspicuous public service. During the siege of Paris constant communication between the beleaguered city and the outside world was obtained by this means, microphotographs of military despatches, private letters, and even newspapers, being printed upon films of collodion and carried by the birds—as much as 30,000 words in some instances. These would then be enlarged by photography and made legible. Subsequently the German, French, and other European governments established regular pigeon corps in the intelligence departments of their armies and navies, and thousands of birds were trained, and many continue to be kept for use as messengers. Experiments were made extensively by the French in the employment of pigeons at sea. It was found that they bore voyages well and would fly from a distance of more than 300 miles to shore stations with great accuracy, but

that they could not be depended on to go from snip to ship. In 1897 many trials were made in the United States navy, especially by Admiral Sicard, and considerable success was attained. A similar news service was attempted by certain newspapers also in coöperation with some of the Atlantic steamship companies, but it was not long maintained.

The flight of one of these birds is steady, direct, and rapid, but the rate of speed has been exaggerated and is now known to be on the average only about 30 miles an hour and rarely 45 miles. It begins with a spiral flight upward as soon as the bird is released from its confinement (usually in a portable dark basket), which is continued to a sufficient height to enable the bird, searching the horizon, to catch sight of some landmark with which it has previously been made familiar. Its memory in this respect is marvelous, and it may be assisted by that instinctive faculty for direction which seems innate in many wild animals. (See MIGRATION OF ANIMALS.) It then directs its course straight towards that point, when it will sight another landmark and so proceed from known place to place until it reaches home. Many societies in various parts of the world are breeding these pigeons and perfecting their abilities, and 500-mile races are frequently run.

The pigeons are a family, Columbidae, of the charadriiform suborder Columbæ, which also includes the families Dididae (see DODO) and Didunculidae (or tooth-billed pigeons). The Columbidae are divided by structural features into subfamilies: 1. Gourinae, containing the gouras (see GOURA). 2. Peristerinae, containing such tropical groups as the Nicobar pigeon, the wonga-wonga of Australia, the bronzewings, and several other robust, often terrestrial forms of the East and West Indies; also the ground doves of American warm latitudes, the scaly doves of the Andean region, the American mourning doves, together with the many species of turtle-doves of the Old World. 3. Columbinæ, the typical pigeons. 4. Treroninae, the fruit pigeons, in the widest sense, about 120 species, most of which are Oriental and African. See TOOTH-BILLED PIGEON.

PIGEON BERRY. The fruit of a perennial herb. See PHYTOLOCA; POKE.

PIGEON ENGLISH. See PIGEIN ENGLISH.
PIGEON FLYING. The art and practice of training and coursing carrier and homing pigeons, according to the rules of societies which exist for the promotion of competitive races. See PIGEON.

PIGEON HAWK. A falcon (*Falco columbarius*), inhabiting the cold and temperate parts of America. It is from 12 to 14 inches in length, with a spread of wing, in the female, of 2 feet to 26 inches. The male, as is usual with falcons, is smaller. In the adult the back is of a bluish-slate color, every feather having a longitudinal black line. The throat, breast, and belly are pale pinkish or yellowish white, each feather with a longitudinal line of very dark brown. The quills are black, with ashy-white tips; bill blue, legs reddish yellow with dark lines. It is the fiercest of all hawks in proportion to its size and lives mainly on small birds, such as pigeons, but rarely if ever attacks poultry. It breeds in the northern part of the continent, but passes the winter in the tropics. A familiar hawk of India, known to falconers there as turumti (*Falco tytus*), and an Ethiopian species (*Falco ruficollis*) complete this lively and interesting genus. Consult American and European ornithologies, especially A. K. Fisher, *Hawks and Owls of the United States* (Washington, 1893).

PIGEON PEA (*Cajanus*). A genus of plants of the family Leguminosæ, of which there is only one species (*Cajanus indicus*), a native of the East Indies, but much cultivated also in the West Indies and in Africa, where, as in other tropical countries, the plants annually drop their leaves and reproduce new ones with their flowers, when they are productive for several years. The seeds are among the most valuable tropical kinds of pulse. The plant is a shrub attaining a height of 4 to 10 feet when grown in favorable regions, although in cultivation it is generally treated as an annual. It grows either in rich or poor soils. Tested at the Louisiana Experiment Station, the pigeon pea was found very susceptible to frost and not well adapted to growing in the United States. In the tropics it has been found to be valuable as a temporary windbreak for young citrus plantings.

PIGEON PLUM. A Florida fruit. See SEASIDE GRAPE.

PIGEON TICK. See DOVE TICK.

PIGFISH. See SAILOR'S CHOICE.

PIGGOTT, pig'ot, SIR FRANCIS TAYLOR (1852-). A British legal scholar and Orientalist, born in Worthing, Sussex. He studied in Paris, at Worthing College, and at Trinity College, Cambridge, and was called to the bar in 1874. Afterward, as secretary, advocate, or judge, he became familiar with the government of Italy, Japan, and Mauritius. In 1905-12 he was Chief Justice of the Supreme Court of Hongkong, being knighted in the former year. Piggott's important works on law (especially international) and on the Far East include: *Foreign Judgments and Jurisdiction* (1879-81; 3d ed., 1908); *Exterritoriality and Consular Jurisdiction* (1892; 2d ed., 1907); *Bering Sea Letters* (1893); *Revised Laws of Mauritius* (1897; 2d ed., 1904); *Nationality and Naturalisation* (1904); *Extradition* (1910); *The Garden of Japan: A Year's Diary of its Flowers* (1892); *Music and Musical Instruments of the Japanese* (1893; 2d ed., 1909); *Huafeng Lao Jen, Letters on the Chinese Constitution* (1913).

PIGEONS

1. WILD or PASSENGER PIGEON (*Ectopistes migratorius*).
2. EUROPEAN TURTLE-DOVE (*Streptopelia turtur*).
3. GROUND-DOVE (*Columbigallina passerina*).

4. TOOTH-BILLED PIGEON (*Didunculus strigirostris*).
5. BLUE ROCK PIGEON (*Columba livia*).
6. CRESTED BRONZEWING (*Ocyphaps lophotes*).
7. CROWNED PIGEON (*Goura coronata*).

FIG IRON. See IRON AND STEEL, METALLURGY OF.

FIGLHEIN, pē'g'l-hin, BRUNO (1848-94). A German painter. He was born at Hamburg, and after studying sculpture there and at Dresden took up painting under Pauwels at Weimar and Diez in Munich. He became widely known through his religious composition "Moritur in Deo" (1879, National Gallery, Berlin), representing Christ on the cross kissed by the Angel of Death. Soon afterward he began to cultivate the pastel and depicted fashionable ladies, rōués, masked figures, and dancers, with Parisian spirit and audacity, but he also executed many refined portraits of women and children and scenes from child life, of which his "Idyl" (child and dog snugly seated by the water) became widely familiar through reproductions. His paintings are essentially pictorial in conception and show great taste, originality, and imagination. An "Entombment" (1888) is in the New Pinakothek at Munich, which also contains the impressive "Blind Maiden Going to the Well" (1890). Piglhein was one of the founders of the Munich Secession.

PIGMENT (Lat. *pigmentum*, from *pingere*, to paint; connected with Skt. *piś*, to adorn). In animals, the coloring granular matter in certain cells of the covering layer of the body ("dermis" of vertebrates, "epidermis" of arthropods). In mammals and in man the pigment is brown or nearly black, that of the retina of the eye very black and abundant, and is always situated in cells of the Malpighian layer, which lies between the epidermis and derma; in amphibians the pigment is accumulated mostly in the derma, partly diffused, and partly inclosed within the cells. In birds, the skin being very thin and concealed by the feathers, the coloring matter is mainly confined to the feathers. The principal pigments are: Zoömelanin, the black animal coloring matter, distributed in amorphous little corpuscles, insoluble in water, alcohol, acid, or ether, but dissolved and destroyed when boiled in caustic potash and then treated with chlorine; it consists of about 53.5 per cent of carbon, 4.6 of hydrogen, 8.2 of nitrogen, and 32.7 of oxygen. Zoöerythrin, red, hitherto found in the red feathers of the cotinga, flamingo, ibis, cockatoo, cardinal, and others, and in the "rose" around the eyes of the grouse. It is soluble in ether, alcohol, and chloroform, but not in acids or in potash. Zoöxanthin, yellow, can be extracted by boiling in absolute alcohol and is a diffused pigment which tinges the shafts, rami, and radii of the feathers and is possibly the same in the yellow feet and bills of birds of prey and ducks; like zoöerythrin, it is a colored fatty oil. Turacin is a most peculiar pigment, detected in the red feathers of the Musophagidæ, and seems to be restricted to these birds. It consists of the same elements as zoömelanin with the addition of from 5 to 8 per cent of copper. Such pigments appear in the coloring matter of birds' eggs. See Egg.

In insects the conditions are somewhat different, as the coloring matter is lodged not only in the scales but in the skin or crust of the body. The pigment in most insects, as well as in the lobster, is secreted in the deeper layer of the skin, under the cuticle, and this layer is called the epidermis. When the lobster casts its shell the soft epidermal layer consists of cells which are filled with red and blue pigment masses. This cellular layer gives rise to the outer cuticle,

which thus derives its hue, red and blue, from the deeper inner layer of color-secreting cells. In most insects the cuticle is nearly colorless or horn-colored or honey yellowish in tint.

PIGMENT. See PAINTS.

PIGMENT SPOTS, or EYES. See EYE, COMPARATIVE ANATOMY OF THE.

PIG'NUS (Lat., pledge). At Roman law, a pledge, i.e., something given to secure performance of an obligation. Originally, as to-day in English and American law, a pledge could be created only in corporal things and only by giving possession, and it conferred no right upon the pledgee except that of retaining possession until the debt was paid. Power of sale in case of the debtor's default was first introduced by contract, but eventually the power of sale became part of the general law of pledge. Pledge of a claim against a third person (*pignus nominis*) was also recognized, a quasi possession of the pledgee being established by notice to the pledgor's debtor. Before the close of the republican period the pledge of a thing had become independent of possession; it could arise by mere agreement, and such a contractual lien was enforceable against third persons. With this change *pignus* and *hypotheca* (see HYPOTHECA) became virtually the same thing. In the Justinian law *pignus* designates a pledge or mortgage of movable property or of a debt, while *hypotheca* designates a mortgage of immovable property.

Pignus could be established not only by contract but by will. It could also be established by levy on property in execution of judgment, and it was created in some cases by direct operation of law, as in the case of the landlord's lien on the effects brought in by the tenant.

Modern civil law recognizes, as a rule, no pledge of movables without possession. See BAILMENT; PROPERTY.

PIG'NUT. See EAETHNUT.

PIGOTT, pig'ot, RICHARD (?1828-89). An Irish journalist and forger. He passed a checkered career on several Dublin newspapers. In 1879 he was proprietor of three newspapers, which he soon sold to the Irish Land League, of which Parnell was president. Hitherto a violent Nationalist, Pigott now began to vilify his former associates and to sell information to their political opponents. His famous transaction was with the Irish Loyal and Patriotic Association, founded in 1886, to resist home rule for Ireland. Consult James O'Connor, *Recollections of Richard Pigott* (London, 1889). See PARNELL, CHARLES STEWART.

FIGRES, pī'grēz (Lat., from Gk. Πίγρης). A Greek poet of the fifth century B.C., supposed to have been the brother or the son of Queen Artemisia of Caria. According to Suidas and Plutarch he wrote a poem entitled *Μαργίτης* (see MARGITES), and he is now generally regarded as the author of the mock-heroic poem *Batrachomyomachia* (q.v.). Figres is said to have been the first poet to introduce the iambic trimeter. Consult Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i, part i (6th ed., Munich, 1912).

FIG'S FACES. See MESEMBRYACEÆ.

FIG-TAILED BABOON. A small black baboon-like monkey, of Celebes Island (*Cynopithecus niger*), which has a rudimentary tail.

FIG-TAILED MONKEY. Either of two species of East Indian macaques, remarkable for their short curling tails. The best known is

the short-haired one (*Pitheous*, or *Macacus nemestrinus*), described by Buffon as the "maimon," which inhabits the Malay Peninsula and is found southward through Sumatra and Borneo. It is as large as a mastiff and has great strength; it was long ago related of it that the Sumatrans trained it to climb trees and throw down coconuts, but it is now believed that if this were ever true it must have been so only of females or young, as the old males become very fierce and unruly.

The Burmese pig-tailed monkey (*Macacus leoninus*, or more correctly *Pithecus andamanensis*) is distinguished by its longer hair, smaller size, and darker color. It has a limited distribution, is rare, and little known. See Plate of MONKEYS OF THE OLD WORLD.

PIGWEED. A name given to various species of *Amaranthus* (see AMARANTH) and often also to certain species of *Cycloloma* and *Chenopodium* (q.v.).

PIKA (adapt. of *piika*, Siberian Tunguese dial. native name). The popular name of the curious little duplicidentate rodents of the genus *Lagomys*, related to hares and rabbits, but representing a distinct degenerate family, the Lagomyiidae. They are sometimes called calling hares, little chief hares, and conies. They are about the size and shape of a guinea pig and are not superficially at all like the hares, except about the nose, though the rounded ears are large and the tail very short. Three species at least are known—one in Europe and Asia, a second in Asia, and the third in the mountainous parts of the western United States. The latter (*Ochotona princeps*) is 7 inches long, the tail less than an inch. It is dark grizzled blackish above and dirty whitish beneath. It inhabits the higher parts of the mountains, generally just above the timber line. The pikas are somewhat gregarious, and numbers usually inhabit masses of rocky debris at the base of cliffs, where their squealing note makes their presence known. They are timid, unsuspicious, and perfectly harmless animals. They feed entirely upon vegetable matter and store up hay and dried vegetables—which they cut and lay in the sun to cure—as bedding and fodder for the winter. See Plate of HARES AND PIKA.

PIKE (so called from its sharp snout and slender shape). The name of any one of several species of soft-rayed fishes of the family Lucidae (or Esocidae). They have an elongated body, slightly compressed posteriorly and covered with scales. The head is long, with a prolonged and depressed snout. The mouth is large, the lower jaw somewhat the longer, and well supplied with strong, sharp teeth. The dorsal and anal fins are inserted far back. There is a single genus, *Lucius* (Esoc), with six species all restricted to the northern part of North America except one species (*Lucius lucius*), which is found also in northern Europe and Asia. This, the "common" or English pike, grows to a length of about 4 feet. The "general color is bluish, or greenish gray, with many whitish or yellowish spots . . . arranged somewhat in rows; the dorsal, anal, and caudal fins with roundish or oblong black spots." It is called both pike and pickerel in the United States. The greatest of the American pikes is the maskinonge (q.v.), of the Great Lakes, which differs little from the European species. The remaining species are described under PICKEREL.

All the pikes are known for their voracity and

are hated by fish culturists because of their inroads on other more desirable species. A pike willingly attacks any fish of its own size and preys freely on the smaller ones, even of its own species. Frogs are frequent prey; water rats and ducklings are sometimes devoured. They spawn in spring in grassy shallows of the rivers and weedy waters in which they live, laying many thousands of eggs, which remain entangled in the vegetation until they hatch. The young pikes grow with great rapidity and in England are known as jacks, or pickerels. The Scottish name is gedd, a term similar to those in the Scandinavian languages.

The pike is caught by means of nets, by the rod, by set lines, and by trimmers or jiggers, which may be briefly described as floats with lines attached to them, the line being so fastened that the bait swims at a proper depth and that some yards of line may run out when the bait is taken. In angling for pike various baits are used, such as a minnow, a portion of a fish, etc., and sometimes an artificial fly is employed with success. These are English methods. In the United States a commoner method is by trolling with a spoon bait. They are much caught also through the ice of the northern lakes. See Colored Plate of AMERICAN GAME FISHES, accompanying article TROUT; and Plate of NEEDLE-FISH, PIKES, ETC.

Various other fishes are often called pikes, as the gars (see GAR), and pike perches (see PIKE PERCH). The Sacramento pike (q.v.) is a chub; the picuda is a barracuda.

PIKE (AS. *pis*, OF. *pique*, *picque*, Fr. *pique*, pike). A weapon of warfare used extensively till the introduction of the bayonet. Among ancient armies the Macedonians were famous for their spear or pike men, who carried weapons fully 24 feet long, while among comparatively modern armies pikes averaged a length of 12 to 14 feet. They were of stout wood and were tipped with a flat-shaped iron spearhead, which sometimes had cutting edges. At the other end was a spike for sticking in the ground. As a defense against cavalry the pike, from its length and rigidity, was of great value; but though it survived the introduction of gunpowder, that event was really fatal to it. The use of the words "pike" and "pikeman" to describe infantry armed with this weapon dates from the fifteenth century. In pike formations a depth of several men was essential, but the growing use of artillery rendered this impossible. For the transition from pike to bayonet, see BAYONET. See also INFANTRY.

PIKE, ROBERT (1616-1706). An American colonist, born in England. He emigrated to America with his father, John Pike, in 1625 and settled in Newbury, Mass. Four years later he removed to the farm at Salisbury which was his home for the remainder of his life. He early became a man of prominence in the Colony, was major of the local militia, and from the time he was 28 years old until his death, with the exception of three years when he was at odds with the General Court, he held political office, being for a long time a member of the General Court itself and later of the Board of Assistants. He was chiefly remarkable, however, as the representative of the first advocates in America of the people's right to free speech, to petition and to criticize their legislative bodies, and to demand acquittal in a court of law when not confronted with conclusive evidence. Though strictly

orthodox in his own beliefs, he defended the right of the Quakers to the free expression of their views and criticized the General Court for its action against sectarians. For this he was disfranchised by that body. Though he believed in the possibility of witchcraft, he protested against the admission of "spectre testimony" at the trials of supposed witches. Several were condemned in the towns about Salisbury despite his labors in their behalf, but, probably because of his influence, none were executed; and so this little group of villages was saved from sharing in the notoriety of Salem.

PIKE, WALL-EYED. See **PIKE PERCH.**

PIKE, ZEBULON MONTGOMERY (1779-1813). An American soldier and explorer, born in Lambertton, N. J. He was taken by his father, an army officer, to Bucks Co., Pa., and then to Easton. At the age of 15 he was a cadet in his father's regiment, became ensign March 3, 1799, and was made first lieutenant Nov. 1, 1800. On Aug. 9, 1805, he started from St. Louis on an expedition to reach the sources of the Mississippi and was successful, returning in April, 1806. He started on another expedition on July 1, ascended the Missouri River and the Osage into the present State of Kansas, and thence proceeded south to the Arkansas River. He ascended this to the present site of Pueblo, Colo., viewed Pike's Peak (named in his honor), and then went to the site of the present Leadville. While searching for the Red River, he reached the Rio Grande on Spanish territory and was sent under guard by the Spanish Governor of New Mexico to General Salcedo at Chihuahua. After some delay he was escorted to the boundary and on July 1, 1807, reached Natchitoches. He had been made captain in 1806 and was promoted to be major in 1808, lieutenant colonel in 1809, and colonel in 1812. On March 12, 1813, he was nominated brigadier general (though he was not confirmed by the Senate before his death) and was assigned to the principal army as adjutant and inspector general. In the expedition against York (Toronto), Upper Canada (Ontario), he landed on April 27 and stormed one of the redoubts. The retreating garrison blew up the magazine, and a falling piece of rock crushed his spine so that he died within a few hours. Consult the valuable *Expedition of Zebulon M. Pike to the Headwaters of the Mississippi, through Louisiana Territory, and in New Spain* (3 vols., New York, 1895), which contains Pike's own text (first published in 1810) rearranged, with full notes and an elaborate memoir by Elliott Coues.

PIKE PERCH. The name given in America to a genus of perches, *Stizostedion*, and in Europe to species of a very nearly related genus, *Lucioperca*, because of their rather elongate body and the resemblance of the snout to that of a pike. They are true perches and inhabit the lakes and streams of Europe, western Asia, and eastern North America. There are several species in each genus, and all are important food fishes. They are usually under 2 feet in length, but *Lucioperca sandra* of Europe may reach a length of 4 feet, and *Stizostedion vitreum* of America a length of 3 feet and a weight of 20 pounds. The latter is a fish of many names in the United States, wall-eyed pike being perhaps the most widespread and familiar—a name, like white eye and glass eye, given because of the prominent eye; dory, yellow or blue pike, and jack salmon are other local

names. It is brassy olive in color, with the lower jaw, belly, and lower fins pinkish. It is scattered in favorable waters all over the North-western States and the Mississippi valley and is caught both in nets and by angling.

A second species (*Stizostedion canadense*) is more northerly in its distribution and is known as sauger and sand or gray pike. It is particularly a fish of the Great Lake region and has a more cylindrical form and more spotted fins than the wall-eyed pike, from which it may also be distinguished by absence of the jet-black spot over the hinder spines of the dorsal fin. See **Plate of PERCHES.**

PIKE'S PEAK. A famous peak of the Rocky Mountains, in El Paso Co., Colo., about 6 miles west of Colorado Springs (Map: Colorado, D 3). It was discovered in 1806 by Lieut. Zebulon M. Pike (q.v.). It was successfully scaled by a party led by Major S. H. Long in 1819, and in 1891 a rack and pinion railroad to the summit was opened, where a searchlight was installed in 1905. Its height is 14,108 feet above the level of the sea, and it commands a magnificent and widely extended view of the great plains and of a rugged mountainous country, containing many lakes and rivers. Though several mountains in the State are higher, none perhaps has a more majestic and commanding appearance. Conifer forests cover the slopes to a height of 11,700 feet, above which the mountain consists of bare granite rocks.

PILASTER (ML. *pilastrum*, little pillar, dim. of Lat. *pila*, pillar). An architectural member consisting of a vertical strip projecting slightly from the face of a wall, having a base and capital corresponding to those of a column and supporting an entablature. It occurs chiefly in the classic and Renaissance styles, but is found also in mediæval and Oriental buildings. In Greek architecture it was called *antæ*; in Roman buildings, as in Greek, the pilaster usually responded to a column, but it was sometimes used independently on the flanks and corners of temples, triumphal arches, etc., especially in Syria. In late examples it was sometimes adorned with richly carved arabesques instead of flutings. The decorative pilasters of the early Italian Renaissance were the most charming works of their class and, though inspired from Roman art, were more profusely used than in any other style. See **ORDERS OF ARCHITECTURE.**

PILATE, pi'lât, ACTS OF. See **APOCYPHA, New Testament.**

PILATE, ARCH OF. An arch spanning the Via Dolorosa at Jerusalem, said to mark the spot where Jesus with the crown of thorns was presented to the Jews by Pilate with the words "Ecce Homo." The structure is probably a Roman triumphal arch.

PILATE, PONTIUS (Lat. *Pontius Pilatus*, Gk.

Πόντιος Πειλάτος, Pontios Peilátos, the second and third of his three Roman names, the first being unknown; neither name is of certain derivation). The fifth in the series of Roman governors of the territory comprising Judæa, Samaria, and a large part of Idumæa, which, after the deposition of Herod Archelaus in 6 A.D., became an Imperial province. His official title was procurator, and he resided at Cæsarea, going up to Jerusalem at the season of national feasts with a band of soldiers, primarily to provide against possible disorder. His duties were both administrative and military, giving him complete judicial authority except in cases of Roman citizens, who had the right of appeal to Rome. In cases of extreme necessity he was subordinate to the Governor of Syria, but practically his control of his territory was absolute. Pilate's term of service in Palestine was from 26 to 36 A.D., extending from the appearance of John the Baptist, through the ministry of Jesus, and the early years of the Church. His administration was marked by strained relations between himself and the Jews, whose intense religious convictions and national pride he failed to understand. He was thoroughly hated by the people and finally, on their complaint, was recalled to Rome. Before his arrival the Emperor (Tiberius) died, and nothing is known, beyond untrustworthy tradition, of Pilate's fate. Pilate's place in history is chiefly in connection with the trial and death of Jesus Christ. After the Sanhedrin had condemned Jesus to death they came to Pilate, evidently expecting that he would ratify their decision without investigation (John xviii. 28-31). This, however, he refused to do. The Jews therefore presented charges of corrupt teaching, interference with tribute, and false claims of kingship against Jesus, which brought him within the sphere of civil law (Luke xxiii. 2-5). Pilate examined him privately and Jesus answered his questions frankly (John xviii. 33-38; xix. 9-11). As a result of the examination Pilate was convinced that Jesus was criminally guiltless and politically harmless and made an effort to save him, but he feared to do so by peremptory release (Luke xxiii. 4-7, 13-22; John xviii. 38-xix. 4, 12). In the end popular clamor prevailed, and personal and political considerations of a selfish nature outweighed Pilate's loyalty to the functions of a just judge (John xix. 12-16). As to Pilate's character and further career there is considerable material to be found in the apocryphal *Acts of Pilate* (fourth or fifth century) and the *Gospel of Peter* (second century). There is a so-called report of Pilate to the Emperor on the trial and sentence of Jesus contained in various ancient works (e.g., *The Acts of Peter and Paul*); also legends as to his death (e.g., Eusebius, *Hist. Eccles.* ii, 7). The Coptic church has canonized him. Consult, besides the lives of Christ: G. A. Müller, *Pontius Pilatus der fünfte Prokurator von Juddäa* (Stuttgart, 1888); Emil Schürer, *History of the Jewish People in the Time of Jesus Christ* (Eng. trans., New York, 1896); A. T. Innes, *Trial of Jesus Christ* (Edinburgh, 1899); G. Rosadi, *The Trial of Jesus* (London, 1905).

PILATO, LEONZIO. See LEONZIO PILATO.

PILATUS, LEO. See LEONZIO PILATO.

PILATUS, pi-lä'tus, MOUNT. A peak of the Bernese Alps in Switzerland, 6 miles south of Lucerne, rising from the west shore of the

Lake of Lucerne (q.v.) to a height of 6998 feet (Map: Switzerland, C 2). It is visited by numerous tourists on account of the fine view to be had from the summit, which is reached from Alpnach by a rack and pinion railroad. The name is probably a corruption of *pileatus* (capped), but according to a legend it is derived from Pontius Pilate, whose body is supposed to have been thrown into a little lake at the foot of the mountain, and whose ghost, as the legend goes, still haunts the place.

PIL/CHARD (formerly also *pilcher*, from Ir. *pilseir*, pilchard). A European fish (*Clupea pilchardus*), closely allied to the herring and the same thing as the sardine, sardines being simply young pilchards. (See **SARDINE**.) The pilchard occurs in vast schools along the western coast of Europe and in the Mediterranean Sea and is taken by means of seines in enormous quantities for the European markets and canning factories. It reaches nearly the size of the herring, but is rather thicker, and the outlines of the back and belly are straighter; the upper part of the body is bluish green, the sides and abdomen silvery white, the cheeks and gill covers yellowish, and the dorsal fin and tail dusky. In Great Britain it is caught only along the Channel Coast. See Plate of **HERRING AND SHAD**.

PILCOMAYO, pël'kô-mä'yô. A river of South America, the longest tributary of the Paraguay River (q.v.). It rises in the Cordillera Real in west Bolivia and flows with no large deviations southeastward until it joins the Paraguay just below Asunción (Map: Paraguay, II 2). In the lower half of its course it forms the boundary between Argentina and Paraguay. After descending from the Bolivian plateau and breaking through several ridges, it flows for the remainder of its course through the great plain of the Gran Chaco, partly through dense forests, partly through wide marshy tracts, where the banks are submerged, and where the river divides into several parallel channels. It is here a sluggish stream with an average width of 30 yards and so shallow and obstructed as to be almost completely unnavigable. The Pilcomayo has not yet been thoroughly explored, and its length is undetermined, but is estimated at 1200 miles.

PILE (AS. *pil*, from Lat. *pilum*, javelin, pestle, from *pisere*, to pound). In engineering and architecture, a long post, generally

METAL SHOES FOR WOODEN PILES.

of wood but often of iron or concrete, driven into soft soils to support a load or to form an inclosure against the entrance of water. Piles are known by different names, according to their character or use, as bearing pile, sheet pile, screw pile, and disk pile. The most common form of bearing pile is usually a roughly trimmed, slender tree trunk or, less usually, a squared or other dressed timber shape. The woods used for piles are spruce and hemlock for soft soils, pines, elm, and beech for firmer soils, and oak

for compact soil. Engineers usually require that piles shall not be less than 10 inches in diameter at the smaller end. Generally the pile is shaped for driving, and sometimes a pointed iron shoe is attached to the pointed end; the top is frequently bound with an iron band to prevent brooming.

The machines used to drive piles by a falling weight or hammer are known as pile drivers. There are two general forms of such machines, known as drop-hammer and steam-hammer pile drivers. In a drop-hammer pile driver a heavy hammer of iron is pulled to the top of a frame by hand or power and allowed to fall freely on to the pile. The frame consists of two uprights called leaders, about 2 feet apart and from 10 to 60 feet high, which guide the falling weight. These leaders are usually braced back to the pile-driver platform by diagonal timbers. The sides of the hammer are grooved to slide between the leaders, and it weighs from 500 to 4000 pounds, usually about 2000 pounds. It is hauled to the top of the frame by a rope or chain attached to its top and passing over a pulley at the top of the frame, thence to a hand windlass or the drum of a hoisting engine. In one kind of pile driver the rope is attached to the hammer by means of a nipper or block with a sort of tongs, which are automatically opened by a tripping device when the top of the frame is reached, thus allowing the hammer to fall. In another form the rope is permanently attached to the hammer, which is set free by loosening a friction clutch, thus allowing the drum to unwind the rope, which is pulled down with the hammer. The latter form of driver is the one least commonly used and is the most expensive in first cost, but is

driver strikes blows having much less energy than those of a drop-hammer driver, it strikes its lighter blows so much more rapidly that it compares favorably with the best friction drum drop-hammer drivers in efficiency.

The two other forms of pile drivers are the gunpowder driver and the water-jet driver. The

gunpowder driver is seldom used and is worthy of mention chiefly for its novelty. The water jet is not strictly a pile driver but it is so well known a method of pile driving that it merits mention here. The method is very simple; a jet of water is forced into the soil just below the point of the pile, thus loosening the soil and allowing the pile to sink either by its own weight or with very light blows. The water is conveyed to the point of the pile by a hose, which is held to the pile by staples during sinking and pulled up to be used again after the pile is sunk. The water jet is effective in clear sand, mud, or soft clay, but is not used with any advantage in gravel, hard clay, or sand containing much gravel.

Piles sunk by the methods just described support their loads partly by the friction of the soil on the sides of the pile and partly as a column by the point resting on an impenetrable material. There are two methods of determining the supporting power of a pile: (1) to note its resistance to penetration under the last blow of the pile-driver hammer, and (2) to load the pile and observe the weight that it will safely stand. The former method is the one in most general use, the latter being used simply as confirmatory evidence in doubtful cases. Valuable results are secured by loading several piles, and in some tests made by the New York City Dock Department in 1914 concrete blocks weighing 220 tons were used in a test of a cluster of 16 piles, each from 85 to 90 feet in length and driven in deep water and a very soft mud bottom. See FOUNDATION.

The two most common forms of iron piles are screw piles and disk piles. Sometimes the stem of such piles is of wood, while the screw and disk are of metal. Screw piles for engineering work usually have a shaft from 3 to 8 inches in diameter, with screws from 3 to 6 feet in diameter. They are driven by rotating the shaft just as an ordinary wood screw is driven, capstan bars being usually employed to secure the screwing motion, although hydraulic screwing devices have been occasionally employed. Screw piles will penetrate all ordinary soils. They are employed for foundations of beacons and buoys, small lighthouses, and for supporting light bridges. They are seldom used in the United States, but are commonly employed abroad. Disk piles are sunk by the water jet. At the ocean pier at Coney Island, New York (one of the rare American examples of their use), disk piles having wrought-iron shafts 8½ inches in diameter and disks 2 feet in diameter and 9 inches thick were employed. Some of these piles stand 17 feet in the sand and carry loads of more than six tons per square foot of disk.

Concrete piles are either molded before driving, in which case they must be of reinforced construction, or molded in position. If the pile is made before driving, it is provided with a cast-iron point at the bottom and a cushioned head if it is to be placed with a pile driver.

Of course if it is set by a water jet it is necessary either to provide an iron pipe, at the centre of the pile or mold it with a hole. In the reinforced pile illustrated the concrete consists of one part Portland cement, two parts sand, and three parts broken stone or gravel, while the reinforcement consists of four round steel rods, an inch or more in diameter, placed at the four corners of the pile, as shown in the sketch, and extending from the top to the bottom of the pile, where they are connected by iron wire to the pipe used as the water jet. At points about 1 foot apart, between the top and bottom, $\frac{1}{4}$ -inch round steel clips are placed to tie the rods together. The water jet is always used in driving piles of this description.

Of the different forms of piles molded in place there are four varieties employed extensively by engineers and worthy of mention. The Simplex pile consists of a hollow steel shell, which is driven into the ground to the desired depth and then filled with concrete, after which the shell is withdrawn and the molded concrete is in place. The shell may be driven by means of steel points which are left in place, or a hinged cutting edge is provided which can open as the exterior casing is pulled out. In some cases, as in very wet soil, a permanent casing of thin sheet steel is employed. The Raymond pile, generally formed with a large taper, as from a 20-inch butt to an 8-inch point, has a thin shell of steel driven into the ground by means of a collapsible driving core, which is removed, after which the shell is filled with concrete. In the Chenoweth pile wire netting is plastered with cement mortar or concrete and then formed into a cylinder which is available for driving by means of a water jet or otherwise. In the Gow pile a wrought-iron pipe is driven into the ground; then, after the material has been washed out, a frame made of angle bars loosely connected at the junctions is inserted and is revolved so as to form a bell-shaped space below the lower extremity of the pipe. This, when filled with concrete, gives an increased bearing area, while of course the concrete fills the main portion of the pipe proper.

The advantage of concrete piles lies mainly in their increased durability, especially when exposed to air or water, where wood is attacked by the teredo or other marine borers. A concrete pile is believed to be able to support as much weight as two or three wooden piles and is superior in that it does not have to be cut off below the water surface and obviates a more elaborate and extensive masonry structure, which need not begin as low as where wooden piles are used.

Sheet piling varies all the way from small planks to interlocking plates of steel and is used largely for a cofferdam to keep water from structural work in progress. The simplest sheet piles are thick planks sharpened and driven edge to edge, sometimes in two or more rows, while thick tongued and grooved planks may be employed, or the same effect secured by a compound structure or by the use of the so-called Wakefield pile, where planks 10 or 12 inches wide and 10 to 16 feet long are used. Sheet steel piles either may be built up from standard structural shapes, such as channels or I-beams, or there may be special forms, especially designed for this particular purpose. They were first employed in 1901 at Chicago, and their

use has cheapened the cost of cofferdam construction and also increased the depth to which such work may be carried economically. While wood sheet piles are limited by a depth of 30 to 35 feet, there is no such limit to sheet steel piles, and in many cases they are actually cheaper than wood. See BRIDGE; FOUNDATION; LIGHTHOUSE.

PILE (AS. *pil*, from Lat. *pilum*, javelin, pestle). In heraldry (q.v.), one of the charges known as ordinaries.

PILE DRIVER. See PILE.

PILE DWELLING. See LAKE DWELLINGS.

PILES (from Lat. *pila*, ball), or HEMORRHOIDS. Small vascular tumors situated either within or on the verge of the anus. They consist of dilated veins containing either fluid blood or a solid clot covered with inflamed, infiltrated, or permanently thickened mucous membrane. They are termed internal when situated above or within the sphincter, external when below or outside it. Piles vary greatly in size and structure and in the symptoms they produce. They may be merely little knots of varicose veins in the submucous tissue; these may in time increase in size, be forced in and out during defecation, become inflamed and strangulated and even ulcerated and gangrenous. External hemorrhoids usually do not bleed; the internal variety, which extend above the sphincter for an inch or more, are soft, purple, irregular masses, and bleed readily when irritated by hardened fecal masses. Arterial piles contain, besides a large vein, arteries of some size. These bleed easily and freely, but are comparatively rare. Children are occasionally afflicted with capillary piles, small sessile tumors, which also bleed.

Hemorrhoids are caused by any circumstance which produces long-continued venous congestion in the rectum. Constipation, enlargement of the prostate gland, pregnancy, tumors of the uterus or its appendages, congestion or cirrhosis of the liver, certain diseases of the heart and lungs, sedentary occupations, and relaxing climate are a few of the causes. Overuse of strong cathartics and horseback riding are mentioned as factors.

The following are the general symptoms of this affection. The patient, after having experienced for a varying time a feeling of heat, fullness, and dull pain about the lower part of the bowel, becomes conscious of a foreign body in the anus and, on examination, discovers a small tumor, which either remains outside or is retracted, according as it originates without or within the sphincter. This tumor gradually increases, and others form around it, until a mass at length results as large as a pigeon's egg, or larger. In its ordinary indolent state the tumor has little sensibility and occasions comparatively little annoyance, but when inflamed it is exquisitely tender and is the seat of burning and stinging sensations, rendering the

evacuation of the bowels (and sometimes of the bladder also) difficult and painful. In women an inflamed pile may cause pain in the back and other anomalous symptoms. In severe cases the patient can neither stand nor sit with comfort and finds relief only in a horizontal position.

Piles may be prevented by active exercise, mild saline catharsis, a light, laxative, nonstimulating diet. These measures may also avail to cure or hold in abeyance the affection in its earlier stages and, with the exception of the first, are always indicated in conjunction with other means of treatment. Scrupulous cleanliness must always be observed. When inflamed, in addition to precautions, piles should be treated by absolute rest, warm fomentations, and the injection of cold water into the rectum several times a day. As the acute symptoms subside astringent and sedative lotions, such as lead water and laudanum and extract of hamamelis, may be applied. Internal piles that protrude must be pushed back; if they become strangulated, hot applications are to be used until reduction is possible. For the bleeding, which is sometimes severe, cold applications and injections usually suffice. Hemorrhoids occasionally become so troublesome as to make life a burden, and operation is the only measure that will bring relief. The tumors, if external, may be simply tied with ligatures at the base and cut off. Internal hemorrhoids are treated in various ways. They may be drawn down, ligated, and cut off in the same manner as external piles, or they may be ligated, incised, and the clot turned out, the stump being returned to the rectum; they may be clamped, clamped and crushed, injected with carbolic acid, or dissected out and excised. In persistent cases the whole pile-bearing area of mucous membrane may be dissected and removed and healthy membrane brought down to take its place.

PILEUS, *pīl'ē-ūs* (Lat., cap). The caplike top of a toadstool. See **BASIDIOMYCETES**.

PILE/WORT. An herb. See **RANUNCULUS**.

PIL/GRIM (OF. *pellegrin*, *pelerin*, *peregrin*, Fr. *pèlerin*, pilgrim, from Lat. *peregrinus*, foreigner, pilgrim, from *pereger*, being in foreign lands, from *per*, through + *ager*, field). One who visits some distant place for a religious purpose. The notion that particular localities possess special sanctity is widespread. The gods of primitive religions are local and can be approached only within their proper boundaries or at their peculiar sanctuaries. Hence, when their worshipers become scattered, a journey is necessary to offer devotion or ask for favors. A place where a theophany is supposed to have occurred is naturally considered as consecrated by the divine presence and particularly favorable for answer to prayer. Localities of importance in the history of a religion or in the lives of persons specially revered attract the interest and devotion of the faithful. In religions where self-mortification is considered meritorious or obligatory, the trouble and pains involved in a journey, particularly in times and places where travel is neither easy nor secure, have made of pilgrimage a meritorious act and pious duty. On the other hand, the journey affords opportunity to see the world, satisfies the love of adventure, and provides an outing, and this element is not to be overlooked in tracing the history of pilgrimage.

Pilgrimages are characteristic of many reli-

gions, as those of ancient Egypt, Persia in the Mithraic period, Syria, Mexico, Peru, India, China, and Japan. The Greek and Roman custom of consulting the gods at local oracles, like Dodona of Delphi, is well known. In the early period of Hebrew history there were many local sanctuaries, and pilgrimages to some of them are clearly indicated, as Shiloh (1 Sam. i. 4), Ophrah (Judges viii. 27), Dan and Bethel (1 Kings xii. 30-33). The great Mohammedan pilgrimage to Mecca (see **HAJJ**; **MOHAMMEDANISM**) is a survival of pagan times. Besides this, which is obligatory on every Mussulman, there are numerous devotional pilgrimages, particularly to the tombs of saints. Kairwan (q.v.) in Tunis, Wazan in Morocco, Kerbela (q.v.) in Mesopotamia, and Maajid Ali in Irak are sacred cities, the last two in the estimation of the Shiites hardly second to Mecca.

The early Christians regarded certain places with special religious interest; above all, the Holy Land and particularly the scenes of the passion of the Lord at Jerusalem. Other sacred places, too, were held to be fit objects of the same visits of religious veneration. The tombs of the apostles Peter and Paul, and of the martyrs in the catacombs at Rome, are so described by St. Jerome (*Commentary on Ezekiel*). The pilgrimage, however, preëminently so called, was that to the Holy Land; and even after Jerusalem had been occupied by the Mohammedans, the liberty of pilgrimage, on payment of a tax, was formally secured by treaty; and it was from the necessity of protecting pilgrims from outrage that the well-known military orders (see **ORDERS**) had their origin. The Crusades (see **CRUSADE**) may be regarded as a pilgrimage on a great scale, the direct object being to secure for the Latin Christians immunity of pilgrimage. On the other hand, the final abandonment of the Crusades led to a great extension of what may be called domestic pilgrimage and drew into religious notice and veneration many shrines in Europe, which after the lapse of time became celebrated places of pious resort. The chief places of pilgrimage in the West were: in Italy—Rome, Loreto (q.v.), Genazzano, Assisi; in Spain—Compostela, Guadalupe, Montserrat; in France—Fourvières, Puy, Saint-Denis; in Germany—Oetting, Zell, Cologne, Treves; in Switzerland—Einsiedeln; in England—Walsingham, Canterbury, and many others of minor note. The pilgrim commonly bound himself only by a temporary vow of chastity and other ascetic observances, terminating with the actual visit to the place of pilgrimage or at least with the return home. He wore a broad hat, a black or gray cloak girt with a cincture, and carried a long staff. Those who had completed the pilgrimage to the Holy Land brought away a palm leaf and hence were called *palmera*. A string of scallop shells was the badge of a pilgrim from Compostela, a bottle or bell from Canterbury. Pilgrims had many privileges. They were considered holy men whose person was sacred, and were entitled to entertainment and assistance on their way. Hospices for their accommodation were established in many places, notably Rome, and are a prominent feature of Jerusalem at the present day. In the course of time many unworthy persons joined the number and brought pilgrimages into disrepute. They have always been maintained in Italy, Spain, southern Germany, and Switzerland; in France they fell into disfavor during and after

he Revolution. In late years, however, pilgrimages on a very large scale, even from the United States, have visited the sanctuaries of Lourdes (q.v.), La Salette, and Paray-le-Monial (q.v.). Another popular European place of pilgrimage is Czenstochowa in Russian Poland. A famous shrine of the New World is Ste. Anne de Beaupré, near Quebec; and large numbers annually visit the place consecrated by the death of the Jesuit martyrs Father Jogues (q.v.) and his companions at Auriesville, N. Y. The Holy Land is visited still by many pilgrims from the Eastern churches, particularly Russian peasants, and a smaller number from western Europe. Quite another use is that which calls the first settlers in Massachusetts the "Pilgrim Fathers" (q.v.). Consult, for the history of Christian pilgrimages: J. Marx, *Das Wallfahren in der katholischen Kirche* (Treves, 1842); J. A. J. Jusserand, *English Wayfaring Life in the Middle Ages* (4th ed., London, 1892); T. R. Glover, *Life and Letters in the 14th Century* (Cambridge, 1901); L. Dupont, *Pèlerinages* (Paris, 1902); Khan and Sparrow, *With the Pilgrims to Mecca* (New York, 1905); M. M. Newett, *Canon Pietro Casola's Pilgrimage to Jerusalem in the Year 1494* (Manchester, Eng., 1907); S. H. Heath, *Pilgrim Life in the Middle Ages* (Boston, 1912); and for some of the most famous shrines: J. S. Northcote, *Celebrated Sanctuaries of the Madonna* (London, 1868); J. C. Wall, *Shrines of British Saints* (ib., 1905). A valuable series of pilgrim accounts is the publications of the *Palestine Pilgrims' Text Society* (13 vols., ib., 1897). For modern pilgrimages: Stephan Graham, *With the Russian Pilgrims to Jerusalem* (ib., 1913). See PILGRIM FATHERS.

PILGRIMAGE OF GRACE, THE. The name given to an uprising in the north of England in 1536. The destruction of the smaller monasteries by Henry VIII angered the country gentlemen and the Commons, who had taken great pride in these institutions and had received educational and other benefits from them. They feared, too, that after this work was done, Cromwell, the King's evil genius, would plunder even the parish churches. This was the chief grievance which drove 60,000 men of Lincolnshire to rebellion. Though they soon dispersed, a more formidable uprising in Yorkshire took place under the lead of Robert Aske, a gentleman and barrister. Priests encouraged the movement. The rebels, calling their march the Pilgrimage of Grace and carrying a banner embroidered with the five wounds of Christ, demanded a renewal of the connection with Rome, restoration of the monasteries, and punishment of Cromwell. As the King's forces could not cope with the insurrection, he promised to call a Parliament in the north to settle the grievances. The rebels thereupon returned to their homes; but, far from keeping his word, Henry not only put to death 20 leaders of the rebellion, but covered the whole north with gibbets. Consult C. S. Todd, *Incidents in the History of Kingstons-upon-Hull* (London, 1869), and A. F. Pollard, *Henry VIII* (New York, 1905).

PILGRIM FATHERS. A term used for the earliest immigrants to Massachusetts and more especially for the settlers at Plymouth in 1620. Governor Bradford, Cotton Mather, and others spoke of them as "pilgrims and strangers upon the earth." Before the beginning of the nineteenth century the term came to be used

as an appellation. A distinction should be made between the Pilgrims, who settled Plymouth, and the Puritans (q.v.). The Puritans sought the reform of the Church of England. The Pilgrims were Separatists from the first, who had already left England and formed an independent congregation in Leyden, whence they came to New England. They numbered 41 families, 102 persons, landing at Plymouth after a voyage of 63 days, on Dec. 20, 1620. They had previously made a covenant, known as the Mayflower Covenant, which bound them into a civil state upon a religious basis. They wished to found "a church without a bishop, a state without a king." In the reaction from the Church of England they laid aside all religious ceremonials, so that for a time marriages and funerals were conducted without religious services and public worship was stripped of all semblance of ritual. See CONGREGATIONALISM; MASSACHUSETTS; ROBINSON, JOHN.

Bibliography. Leonard Bacon, *Genesis of New England Churches* (New York, 1874); Edward Arber, *The Story of the Pilgrim Fathers, as Told by Themselves, Their Friends, and Their Enemies* (Boston, 1897); John Brown, *The Pilgrim Fathers of New England and their Puritan Successors* (New York, 1897); H. M. and Morton Dexter, *The England and Holland of the Pilgrims* (Boston, 1905); Winnifred Cockshott, *The Pilgrim Fathers: Their Church and Colony* (New York, 1909); W. E. Griffis, *The Pilgrims in their Three Homes* (rev. ed., Boston, 1914); F. M. Gregg, *Founding of a Nation* (ib., 1915).

PILGRIM'S PROGRESS, THE. A famous allegory by John Bunyan—the first part printed in 1678, the second in 1684. The first part describes the journey of Christian to the Celestial City; the latter, the journey thither of his wife, Christiana, and her children. This drama of the soul's progress through life was written in Bedford prison, probably in 1675-76, and not during Bunyan's earlier and longer imprisonment. The pilgrim idea of life was an old one, but never was worked out in so powerful a manner as by this humble Puritan, whose only helps were his Bible and Fox's *Book of Martyrs*. In its author's lifetime, *The Pilgrim's Progress* ran through 10 editions, and now the editions of it in English and in many other languages are unnumbered. It is still a living book and the greatest of allegories. Its appeal at first was to the lower and lower middle classes, and the numerous early editions, by the meanness of the paper, print, and illustrations, show that they were not designed for well-to-do or cultivated readers. Certain of the more austere Puritans, finding it beyond question pleasant and beguiling reading, began to distrust it as a vain romance. It is a curious fact, in this connection, that *The Pilgrim's Progress* leads on to the work of Fielding, Smollett, Sterne, and other novelists whom its Puritan author would have denounced as profane. In literary qualities it is a great book, expressing Bunyan's own aspirations and hopes, his reverence for the right, his human kindness, and his spiritual struggles. The story, of irresistible narrative interest, and written in the most vigorous and idiomatic English, is graphic in description and is enlivened by humor. Bunyan enlists the sympathies of his readers warmly on the side of virtues which, on the whole, the moral sense of the world to-day prizes as highly as did Bunyan himself.

PILGRIM'S TALE, THE. A poem erroneously attributed to Chaucer as one of the *Canterbury Tales*. A confused story was told of it by the son of Thynne, who edited Chaucer's works in 1532 and is said to have printed it. But it is not found in either of Thynne's editions. It appeared in *The Courte of Venus*, a collection of verse published about 1536, in which it is credited to Chaucer. Only two fragments of this work exist in Oxford, one of which contains the *Tale*.

PILID/TUM. See NEMERTINEA.

PILKINGTON, LETITIA (1712-50). An Irish adventuress, born in Dublin. She was the daughter of Dr. Van Lewen, an obstetrician, and married Matthew Pilkington, an Irish clergyman, in 1729. Jonathan Swift, then Dean of St. Patrick's, Dublin, was attracted by her vivacity and ingenious manners and helped her improvident husband to get a position in London. Afterward the pair were divorced, and Mrs. Pilkington lived in Ireland and England, befriended by Colley Cibber, Samuel Richardson, and others. Her *Memoirs* (1748) have been criticized as false, but they are written in an engaging style. Thackeray uses them freely in his *English Humourists*.

PILL (from Lat. *pilula*, abbreviated in mediæval prescriptions to *pil.*, pl. *pill.*, pill, little ball, dim. of *pila*, ball). Pills are globular masses of a size convenient for swallowing and of a consistence sufficient to preserve their shape and yet not so hard as to be difficult of solution in the stomach or intestines. They are especially suitable for remedies which operate in small doses, as the metallic salts; substances whose action it is desired to retard until they have reached the intestines; bodies whose specific gravity is too inconsiderable to allow their suspension in aqueous vehicles; and substances which are disagreeable to the taste or smell. The pill form is, on the other hand, unsuitable for medicines which it is necessary to give in large doses; fluid or semifluid substances, such as oils, balsams, etc., which require a very large proportion of some dry powder to make them into a mass; and substances so insoluble that when exhibited in solid form they pass through the intestinal canal unaltered, as extract of logwood. Many substances, such as vegetable extracts, may be at once formed into pills without any addition; but most of them require an excipient for converting them into a pill mass. The excipients in common use are soap, extract of licorice, mucilage, sirup, molasses, honey, castor oil, and confection of roses; the latter is probably the most generally useful, from its property of remaining soft for a considerable length of time. It is common to place pills in some fine powder to prevent them from adhering to one another and to conceal their taste. For this purpose licorice powder, wheat flour, starch, magnesia, and lycopodium are employed. Pills made in large numbers and by machinery are often coated with sugar variously colored and flavored, gelatin, keratin, and other materials. Fourteen pills are official in the *United States Pharmacopæia*, but numberless formulæ are compounded extemporaneously. The tendency of pills to become hard and insoluble with age has resulted in their replacement to a considerable extent by "tablet triturates," in which the ingredients are simply mixed with milk sugar and compressed into easily crumbling masses. A very large pill is sometimes called a bolus,

while very small pills are known as granules. See CAPSULE.

PIL/LAR (OF. *pilar*, *pilier*, Fr. *pilier*, from ML. *pilare*, *pilarius*, *pilarium*, *pilleare*, *pillar*, from Lat. *pila*, pillar, pier, mole). A term signifying properly a free-standing, independent columnar structure of considerable size, erected either for the sake of its appearance or to support a statue or other commemorative object. The term is loosely and incorrectly applied also to almost any support of masonry, round, square, or polygonal; more properly called column or pier, according to its shape.

PILLAR SAINT, or **STYLITE**. One of a remarkable class of ascetics, chiefly of Syria, who, with a view to separating themselves more completely from earth and fellowmen, took up their abode on the tops of pillars and remained thus without descending to earth, exposed to all the variations of climate or sheltered only by a hut built on top of the pillar. The earliest of these and the most celebrated was St. Simeon or Simon Stylites, a Syrian monk, who was born near the close of the fourth century and is said at first to have lived for 10 years in extreme seclusion in his monastery in the neighborhood of Antioch, without ever moving from his narrow cell. Increasing in enthusiasm, about 423 he withdrew from the monastery and built a pillar, on the top of which, only a yard in diameter, he took up his position. From this pillar he removed to several others in succession, each higher than its predecessor, till at last he attained 40 cubits, or about 60 feet in height. In this life he spent 37 years. Many remarkable stories are told of his austerities, and he acquired the reputation of a miracle worker. The fame of his sanctity brought crowds of pilgrims from the most distant countries to see him, and he is said to have converted many to the Church. A disciple of Simeon, named Daniel, succeeded to his reputation for sanctity and to his mode of life, which he maintained for 33 years, in the still more trying climate of the shores of the Bosphorus, about 4 miles from Constantinople. Another Simon Stylites (died 597) lived near Antioch and also had a great reputation for austerities and miracles. Still another lived, perhaps in the fifth century, in Cilicia. In Syria there were many pillar saints as late as the twelfth century; after the sixteenth century they disappeared altogether. In the West there is only a solitary example. A monk named Wulfraicus, near Treves, attempted the pillar life in 585, but the neighboring bishops compelled him to desist and destroyed his pillar. Consult the early lives of St. Simon, edited by Hans Lietzmann, in Harnack and Gebhardt, *Texte und Untersuchungen*, vol. xxxii (Berlin, 1906), and Hans Lietzmann, *Das Leben des heiligen Symeon Stylites* (Leipzig, 1908).

PILLARS OF HERCULES. See HERCULES, PILLARS OF.

PILLAU, pil'lou. A seaport town, fortress, and bathing resort of East Prussia, situated on the south end of a tongue of land separating the Frisches Haff from the Baltic Sea, at the entrance to the former and 29 miles west of Königsberg, with which it is connected by rail and by a navigable channel (Map: Prussia, H 1). It is the outer port of Königsberg. Pop., 1900, 2993; 1910, 7066.

PILL BEETLE. A beetle of the family Byrrhidae, a term used by English collectors. The group is a small family of 200 to 300 species, of

which about 40 occur in the United States. They are small insects, move very slowly, and when disturbed at once contract the limbs so completely that they look like inanimate objects.

PILL BUG. See ISOPODA; SOW BUG.

PILLING, JAMES CONSTANTINE (1846-95). An American ethnologist, born in Washington, D. C. He was educated at Gonzaga College in that city, and while with Major J. W. Powell (q.v.) on the Rocky Mountains Geological Survey (1872-79) had opportunity for studying aboriginal dialects. In 1879 he was appointed chief clerk of the Bureau of Ethnology, and in 1881 chief clerk of the United States Geological Survey. Pilling published a general bibliography, *The Languages of the North American Indians* (1885), and later a number on individual languages.

PILLNITZ, pil'nits. A palace and ordinary summer residence of the royal family of Saxony, in a beautiful situation, 6 miles southeast of Dresden. Pillnitz acquired a historic interest from the meeting of Leopold II and Frederick William II held in the castle in August, 1791, when the Declaration of Pillnitz was framed, in which Austria and Prussia affirmed that the affairs of King Louis XVI (then a prisoner in the Tuileries, after his ineffectual attempt to escape from France) were a matter of common interest to the sovereigns of Europe and expressed the hope that common cause would be made for his restoration. The Emperor and the King of Prussia were resolved to use force in order to effect this result; but any immediate interference on their part was rendered unnecessary by Louis's acceptance of the constitution as modified by the National Assembly, after which he was again placed on the throne.

PILLON, pē'yōn', FRANÇOIS (1830-1914). A French philosopher, born at Fontaines. He studied at the seminary of Auxerre, took part in the revolution of 1848, went to Paris in 1852, and became a doctor of medicine. He soon turned to philosophy and in 1867 founded, with Renouvier, *L'Année Philosophique*, which was interrupted by the War of 1870. It became the *Critique Philosophique*, but in 1890 was again published under its first title. In this new series (23 vols., 1890-1913) the most important work of Pillon is to be found. Especially notable was his annual 100-page critical résumé of important philosophical contributions. Besides translating Hume and Kant, whose influence on his own thought is evident, he contributed to the *Grand Dictionnaire Larousse* and published *La philosophie de Charles Secrétan* (1898). From 1900 to the year of his death he was annually awarded the Gegner prize by the Academy of Moral and Political Sciences. To Pillon William James dedicated his *Principles of Psychology*.

PILLORY (OF., Fr. *pilori*, from Prov. *espitlori*, pillory, from Lat. *speculatorius*, relating to an observer, from *speculator*, observer, investigator, scout, spy, from *speculare*, to view, from *specula*, watch tower, from *specere*, to see). An obsolete instrument of punishment. It consisted of two parallel boards, joined by sliding hinges and fixed like a signboard on the top of a strong pole, supported on a wooden platform elevated above the ground. A large circular hole with its centre in the line of junction of the two planks received the neck, and two corresponding holes of smaller size, one on each side of it, the wrists. The pillory existed in England before the Conquest, in the form of

the halafang or catch neck, an instrument by which the neck only was confined. By the "statute of the pillory" of Henry III it was made the instrument for punishing "forestallers, users of deceitful weights, perjury, forgery, etc.," and all such dishonorable offenses. Its use was confined to this class of offenders till 1637, when restrictions were put upon the press, and all who printed books without a license were put in the pillory. From this time it became the favorite mode of punishing libelers, authors and publishers of seditious pamphlets or of strictures on the government, and many eminent men suffered on the pillory. The inadequacy of the pillory as a means of inflicting punishment, however, became apparent, for to those who were popular favorites it was no punishment, while those who were objects of popular dislike were ill-used to such an extent as occasionally to suffer death. In France the pillory was anciently called *pilori*, and later *carcan*, from the iron collar by which the criminal's neck was attached to the post; but punishment by this mode was abolished in that country in 1832. It was in use in Germany also, where it was known as the *Pranger*. The pillory was abolished in England in 1837, and in the United States, where early statutes had provided for it for some offenses, in 1830. In Delaware, however, the punishment remained till 1905.

PILLOW, FORT. See FORT PILLOW.

PILLOW, GIDEON JOHNSON (1806-78). An American lawyer and soldier, prominent as an officer in the Mexican War and on the Confederate side in the Civil War. He was born in Williamson Co., Tenn., graduated at the University of Nashville in 1827, and began the practice of law in Columbia, Tenn., in the following year. He was commissioned brigadier general and placed in command of the Tennessee volunteers on the outbreak of the Mexican War in 1846. He served for a short time in the Northern campaign under General Taylor, then joined General Scott before Vera Cruz; commanded the right wing of the American army at Cerro Gordo, where he was severely wounded; was promoted to be major general in April, 1847; and participated in the battles of Contreras, Churubusco, and Chapultepec. After the war he was charged with insubordination by General Scott, but was honorably acquitted by a court of inquiry. He then returned to the practice of the law in Tennessee and took an active interest in politics. On the outbreak of the Civil War he entered the Confederate service and was appointed brigadier general. He was in command against Grant at the battle of Belmont on Nov. 7, 1861; was second in command at Fort Donelson under General Floyd, with whom he escaped on the night before the surrender to Grant by General Buckner (see FORT HENRY AND FORT DONELSON); was temporarily relieved from command; and subsequently served under Beauregard in the Southwest and acted as chief of conscripts in the Western Department.

PILLSBURY, HARRY NELSON (1872-1906). An American chess player, born in Somerville, Mass. A strong taste for mathematics early led him to the study of chess. At the International Chess Congress held at Hastings, Eng., in 1895, he won the world's championship over a group of famous experts, the first American since Paul Morphy to attain that honor. Thereafter, from 1896 to 1902, he played in seven international tournaments, in which he tied once for first

place, was second four times, third at Budapest (1896), and tied with Tarrasch for third and fourth the same year. By defeating J. W. Showalter in 1897 and 1898, he won the American championship, which he held at the time of his death. Pillsbury was the most remarkable "blindfold player" in the history of the game of chess.

PILLSBURY, JOHN SARGENT (1828-1901). An American miller and politician, born at Sutton, N. H. He received a common-school education and in 1855 settled at the Falls of St. Anthony, Minn., where he opened a hardware store. In 1872 he became a partner in the firm of Charles A. Pillsbury & Co., flour millers. From 1864 to 1876 he was a State Senator and from 1876 to 1882 was Governor. During his administration he persuaded the people to pay off the State debt, which they had repudiated 20 years before. He gave generously to the University of Minnesota and other public institutions, built a town hall for Sutton (his birthplace), and founded a library for workingmen in East Minneapolis.

PILLSBURY, PARKER (1809-98). An American abolitionist, born at Hamilton, Mass. He removed to Henniker, N. H., in 1814, about 1829 began to drive an express wagon between Boston and Lynn, afterward was a farmer, in 1835-38 studied at the Gilmanton (N. H.) Theological Seminary and in 1838-39 at the Andover Theological Seminary. In 1839 he was licensed to preach and in 1839-40 was pastor of the Congregational Church at New London, N. H. He then withdrew from the ministry, enlisted in the Antislavery movement, was for a short time editor of the *Herald of Freedom* at Concord, N. H., and then became a lecturer in New England and the West. In 1854 he visited England in the interest of the movement. He was fanatical in his views and violent in his methods. He joined Wendell Phillips in the meetings of the American Antislavery Society and elsewhere in opposition to the reelection of Lincoln. His attacks upon the Church, owing to the attitude of the pulpit towards Antislavery reformers, were particularly bitter. In 1868-70 he edited the *Revolution*, a New York journal advocating woman suffrage. Upon the dissolution of the American Antislavery Society, whose continuance for philanthropic work among freedmen he had urged, he became a preacher for free churches at Salem and Toledo, Ohio, Battle Creek, Mich., and other towns of the West. He published some pamphlets, including the text of a lecture, "The Plague and Peril of Monopoly" (1887); *Acts of the Anti-Slavery Apostles* (1884); *The Church as it Is* (1885). The *Acts* contains an autobiographical sketch.

PILLSBURY, WALTER BOWERS (1872-). An American psychologist, born at Burlington, Iowa. He studied for two years at Penn College, Oskaloosa, Iowa, graduated from the University of Nebraska (1892), and took his Ph.D. at Cornell (1896). Pillsbury taught at the University of Michigan after 1897, in 1905-10 as junior professor of philosophy and director of the psychological laboratory and afterward as professor of psychology. In 1908-09 he lectured at Columbia. He served as president of the Western Philosophical Association in 1907 and of the American Psychological Association in 1910. Besides contributing to the *American Journal of Psychology* and to the *Philosophical Review*, he translated, with E. B. Titchener, Külpe's *In-*

troduction to Philosophy (1897) and published *L'Attention* (1906; Eng. ed. as *Attention*, 1908; Span. trans., 1910); *The Psychology of Reasoning* (1910); *The Essentials of Psychology* (1911).

PIL/MOOR, JOSEPH (1739-1825). One of the founders of Methodism in America. He was born at Tadmouth, in the North Riding of Yorkshire, was educated at the Kingswood school, entered the ministry in 1765, and after coming to America in 1789 labored in New York and Philadelphia. He returned to England in 1774. Because he was not included by Wesley in the legal hundred he was offended and retired in 1785. Returning to America, he became a member of the Protestant Episcopal church and was ordained by Bishop Seabury the same year. He still ministered in New York and Philadelphia, the last 20 years of his life being spent as rector of St. Paul's Church in the latter city, where he died. His journal in manuscript is the property of the Methodist Historical Society of Philadelphia; a portion of this has been published by J. P. Lockwood as *The Western Pioneers* (London, 1881).

PILOBOLUS (Neo-Lat., from Gk. *πίλος*, *pilos*, ball + *βόλος*, *bolos*, a throwing). A genus of molds belonging to the Phycomyces (q.v.). It is abundant on stable manure and is remarkable for the method of dehiscence of its sporangium. These sporangium-bearing branches become very turgid and swollen just beneath the sporangium, and finally burst, hurling the sporangia with considerable force. This curious habit has given to the plant the common name, squirting fungus.

PILOCARPINE. See ALKALOIDS; JABORANDI.

PILOCERAS (Neo-Lat., from Gk. *πίλος*, *pilos*, wool, ball + *κέρας*, *keras*, horn). This genus of cephalopods, occurring in the lower Ordovician rocks of eastern North America, represents one of the most primitive types. It has a straight, short, rapidly expanding conch with a very large siphuncle and single camera surrounding the siphuncle on three sides. The best-known species is *Piloceras explanator* from the Beekmantown rocks of the Champlain basin. See CEPHALOPODA.

PILON, pə'lɒn', GERMAIN (c.1535-90). A French sculptor of the High Renaissance. He was born in the Faubourg Saint-Jacques, Paris, about 1535, as is known by a document of 1573. His father was a stonecutter, from whose instruction he passed to that of Pierre Bontemps. At the age of 23 he was engaged with Pierre Bontemps in the execution of a fine monument to Francis I in the church of Saint-Denis. In 1561 was undertaken the extremely important group in the Louvre of three Graces supporting a bronze vase, which formerly contained the heart of Henry II. After the year 1565 Pilon was much occupied with the decoration of the monument of Henry II in Saint-Denis, designed by Lescot. All the sculpture of this monument was formerly attributed to him, but it is now known that only the four principal figures, the King and Queen kneeling and the same reclining, are his. The kneeling King is one of the masterpieces of the French Renaissance. One of the most charming of the works attributed to Pilon is the mantel now in the Louvre which formerly stood in the château of Villeroy. Other fine works in the Louvre are the bronze statue of Cardinal René de Birague, one of the glories of

French sculpture; four wooden figures of the "Cardinal Virtues"; a terra-cotta "Virgin of Pity"; a nude reclining figure in painted stone; and the busts of Charles IX and Henry III. A marble head of Charles IX is in the Metropolitan Museum, New York (Altman collection). Pilon was also charged with the construction of the chapel of the Valois, at Saint-Denis, now destroyed. To the sculptures of this chapel belonged the reclining statues of Henry II and Catharine de' Medici at Saint-Denis and several statues now dispersed in insignificant churches in Paris, notably one of St. Francis of Assisi. In 1571 he had lodgings in the Hôtel de Nesle and assisted in arranging the triumphal entry of Charles IX into Paris. In 1573 he was appointed comptroller general of the coinage. It is supposed that he made the great bronze medals of the Valois, the most interesting of which are those of Catharine de' Medici and Henry III. Pilon died Feb. 4, 1590. His reputation as a sculptor of the High Renaissance in France is second only to that of Goujon. Consult Louis Goussier, *La sculpture française* (Paris, 1895), and Stanislas Lami, *Dictionnaire des sculpteurs de l'école française, du moyen âge au règne de Louis XIV* (ib., 1898).

PILOT (OF. *pilote*, Fr. *pilote*, probably from OF. *piloter*, *pilotier*, to sound with plummet and line; probably connected with Dutch *peillood*, sounding lead, from *peilen*, MDutch *peylen*, *piflen*, from MDutch *pegelen*, to gauge, from *pegel*, capacity of a ship's gauge + *lood*, MDutch *loot*, Goth. *lôþ*, Ger. *Lot*, AS. *lead*, Eng. *lead*). A person who makes a business of conducting vessels in and out of port, through narrow channels, up rivers, or along coasts where the navigation is specially difficult or dangerous. He is possessed, or is supposed to be possessed, of sufficient knowledge of all reefs, rocks, shoals, currents, and other dangers to navigation in the region for which he professes to be, or is licensed as, a competent pilot. Except in little-frequented ports pilots are usually members of a pilot association or company organized under authority of law; and they are required to pass examination as to fitness before being appointed or licensed. The pilotage fees are not retained by the pilot in each case, but are paid into a common fund which is divided among the members according to the rules of the association. In order to furnish a sufficient fund for the payment of an adequate supply of pilots, pilotage is compulsory in many ports, but in these places vessels usually need pay only half pilotage if they do not actually take a pilot. In ports that are not very easy of entrance, marine insurance policies usually require that local pilots be employed under penalty of forfeiture of the policy. Masters of vessels frequenting particular ports very commonly take out a pilot license to reduce the expense of entry and departure. Pilots may be found off all large ports. They were formerly always carried in small fast-sailing schooners or similar vessels, but in recent years many pilot boats are steam vessels. Pilot boats carry numbers, which are placed on the sail or conspicuously painted on the hull (if a steamer). A century ago a pilot was a necessity for a ship entering a locality unfamiliar to the captain or master; but the great improvement in charts, the increase in the number of lighthouses, buoys, beacons, and other aids to navigation, and the change of motive power from sail to steam in more than half the large

vessels of the world have contributed to lessen the pilot's importance.

Pilot Fee. The sum of money paid to a pilot for his services in guiding a vessel in or out of a harbor is called pilotage. Where a pilot is engaged by the proper officer of a vessel, the pilotage is a lien on the vessel. Consult E. C. Benedict, *American Admiralty: Its Jurisdiction and Practice* (4th ed., New York, 1910).

PILOT, THE. A sea tale by James Fenimore Cooper (1823) of the romantic career of Paul Jones.

PILOT CHART. The Pilot Charts of the North Atlantic and of the North Pacific Oceans, issued monthly from the United States Hydrographic Office, Navy Department, Washington, give, in a form suitable for use by seamen, a general view of the climatological conditions prevailing over each of these oceans during the successive months of the year, with certain deductions therefrom, along with a large amount of additional information, meteorological and other, which is likely to prove of value to navigation. The charts are drawn on the Mercator projection, that of the North Atlantic extending from the equator to 60° north and from the meridian of 10° east to 102° west, that of the North Pacific from the equator to 70° north and from 75° west to 117° east. Each of the charts is published some days prior to the first day of the month to which it refers. They are lithographed in three colors, black, blue, and red, the color serving, within certain limits, as an index to the character of the information conveyed. The base of the chart, along with such information as is invariable throughout the year, is printed in black. Among other matter this embraces the lines of equal magnetic variation (see COMPASS, TERRESTRIAL MAGNETISM) for the current year, than which no feature of the chart is more highly appreciated by navigators, owing to the almost universal employment of the Pilot Chart as a track chart, on which the position of the vessel from day to day is plotted. See SAILING.

For the purpose of climatological study the surface of the ocean is supposed to be divided into rectangular areas by the even five-degree parallels of latitude and meridians of longitude, 5°, 10°, 15°, etc. The Pilot Chart for any month gives in blue for each of these areas the atmospheric pressure and temperature prevailing under normal conditions, the average force of the wind, the number of hours within the month during which the wind may be expected to blow from a given quarter, and a mention of the frequency of calms, derived from a discussion of the observations taken within the same month during previous years. All of this is shown symbolically on the face of the chart. In addition to this a brief text, containing a forecast or statement of the average conditions that may be expected during the month for the more frequented parts of the ocean, the probability of storms, the nature of these storms, the frequency of fog (upon the Pilot Chart of the North Atlantic Ocean this is also shown graphically upon the face of the chart), and the limits within which dangerous masses of floating ice may be expected, is also given in blue. The proper sailing and steamship routes for the given month and the limits of the trade winds are exhibited also.

The information given in red is in the nature of a review. Upon the Pilot Chart of the North

Atlantic Ocean it comprises a brief account of the main features of the weather over that ocean during the month preceding the date of publication of the chart. The path followed by the centre of each of the more important barometric depressions that have occurred within that period is shown, and the force of the winds that accompanied them, the latter on the Beaufort scale. The region through which fog has been frequent is shown also. Upon the Pilot Chart of the North Pacific Ocean appears the average track followed by the centres of the barometric depressions for the month that occurred during the 10-year period 1878-1887; also the tracks followed by the centres of the various classes of typhoons, those terrific storms which render navigation in eastern Asiatic waters so often fraught with danger. Upon both charts is given in red the last reported position of floating derelicts, wreckage, buoys, and other obstacles to navigation. Recently reported icebergs and field ice are shown also, all of these being plotted on the chart precisely where last sighted, in order that the mariner may have the dangers that menace his vessel constantly in view, without dependence on his memory and without reference to any publication save the chart before him.

Other features of the chart are the list of equator crossings for several future months, intended for the use of vessels bound on distant voyages; the list of new charts recently published and of additions and corrections to old charts; the storm warnings displayed by the United States Weather Bureau and by other maritime nations, all of which are shown graphically. In addition to these the land space of the chart is always devoted to a discussion of some topic of interest to navigators, such as studies in the law of storms, the experience of various vessels in recent cyclones, recent improvements in the theory and practice of navigation, the relative advantages of different sailing routes, and other similar subjects. The reverse of the chart is also frequently utilized for this purpose, one of the interesting publications of the United States Hydrographic Office being the chart which appears annually on the back of the Pilot Chart, showing the drift of sealed bottles which are cast overboard in various parts of the ocean and which find their way to distant shores.

As in the days of Maury, so now the United States government is still the pioneer in this class of publications for the benefit of seamen. The first edition of the Pilot Chart of the North Atlantic Ocean appeared in December, 1883, that of the North Pacific Ocean in January, 1894. The German government and also the English have entered the field, each of these having in January, 1901, begun the publication of a chart of the North Atlantic embodying many of the features of the American Pilot Chart. The German chart bears the title *Nordatlantische Wetterausschau*, and is published monthly by the Deutsche Seewarte, Hamburg. The British Pilot Chart extends also over the Mediterranean Sea, and is published monthly by the Meteorological Office in London. See HYDROGRAPHIC OFFICE.

PILOT FISH, or **ROMERO**. A fish (*Naucratus duotor*) of the family Crangidae, resembling the mackerel, except that there are no finlets succeeding the dorsal fin. It gets to be about 2 feet long; the general color is silvery grayish blue, five dark transverse bands passing around

the whole body. Its flesh is said to be very delicate, resembling mackerel in flavor, but it is not often found in the markets. It is the only species of the genus, and is widely distributed through the tropical seas. It is often seen in the company of a shark, and is therefore very commonly supposed to direct the shark to its prey. The probable fact is that the pilot fish, in company with sharks and other fishes, follow in the wake of vessels for the purpose of picking up anything edible that may fall from the ship. It is not impossible that the pilot fish finds it a decided protection against enemies to be associated with the shark and in this way has developed the habit. A related fish, one of the amber fishes, is often called shark's pilot; it is *Seriola zonata*, of the American coast from Cape Cod to Cape Hatteras; and a West Indian demoiselle (family Pomacentridæ, *Eupomacentrus leucostictus*) is called black pilot, or cock-eye pilot. The name "pilot fish" is given also to the round whitefish (*Coregonus quadrilateralis*) of the Great Lakes.

Consult George Bennett, *Gatherings of a Naturalist in Australia* (London, 1860), and G. B. Goode, *Fishery Industries* (Washington, 1884). See WHITEFISH; and Plate of HORSE MACKEREL.

PILOT KNOB. A conical hill in Iron Co., Mo., 75 miles southwest of St. Louis (Map: Missouri, F 4). It is about a mile in diameter at its base and consists of beds of iron ore, porphyry, and porphyry conglomerates. The ore is hard, specular, steel gray in color, extremely brittle, and with a faint lustre. A few miles to the northwest is Iron Mountain (q.v.).

PILOT MOUNTAIN. A mountain in North Carolina. See ARARAT.

PILOT SNAKE. 1. A North American black snake which is black or brown above, with or without darker spots approximately square; the belly is very darkly clouded and the head not banded. It is common from New Jersey to Texas, especially in the Middle States, where it is often called mountain black snake, but is known to the mountaineers of the Alleghanian ranges as pilot snake. It is a denizen of forests to a great extent, hiding in hollow logs and in holes of old trees. It climbs trees easily, and in the spring feeds largely upon birds and their eggs and fledglings; otherwise its prey is mainly mice, rabbits, and other small animals. It is

PILOT SNAKE (*Coluber obsoletus*).
1, top of head; 2, profile.

not only entirely harmless, but is remarkable for gentleness, making little resistance to being handled, and soon becoming tame. Stejneger says this species deposits its eggs in hollow stumps and similar places, where they hatch in early summer. Consult Cope, *Crocodylians, Lizards, and Snakes* (Washington, 1900).

2. A local name in the Eastern States for the copperhead (q.v.) and for the fox snake (q.v.).

PILOTY, pé-lô'té, KARL VON (1826-86). A celebrated German historical painter. He was born at Munich, Oct. 1, 1826, the son of the lithographer Ferdinand Piloty (1786-1844), and

was first instructed by his father. Entering the Academy at the age of 12, he studied under Schnorr von Karolsfeld, at the same time assisting his father, whose lithographic business he managed after the death of the latter. He studied also in Antwerp and Paris (1852), becoming thoroughly imbued with the spirit of the Belgian and the French colorists, as is shown by his "Young Mother Dying" (1849) and "The Nurse" (1853). The latter, which was particularly commended for brilliant technic and realistic conception, foreboded a new era. It brought him the commission to paint for the Maximilianeum "The Founding of the Catholic League in 1609" (1854), and the "Sani before the Body of Wallenstein" (1855, New Pinakothek, Munich) led to his appointment as professor at the Academy in 1856. His remarkable ability as a teacher soon made the school of Munich the foremost in Germany. On a visit to Italy in 1858 he made the studies for his "Nero on the Ruins of Rome" (1861, National Museum, Budapest). His principal works during the next decade include "Galileo in Prison" (1861, Cologne Museum); "Godfrey of Bouillon and the Crusaders Approaching the Holy Sepulchre" (1862, Maximilianeum, Munich); the "Death of Caesar" (1865, Hanover Museum), his best-composed work; and "Columbus Discovering America" (1866). Called to Berlin in 1869, he was induced by the personal appeal of King Louis II to remain in Munich, and received the commission to paint "The Triumph of Germanicus" (1873, New Pinakothek), a replica of which is in the Metropolitan Museum, New York.

On the death of Kaulbach in 1874 Piloty was appointed director of the Academy, and soon after his appointment he began the huge allegorical painting of "Monachia" (completed 1879) for the new City Hall. Conspicuous as his only biblical subject appears the parable of "The Wise and the Foolish Virgins" (1881, Metropolitan Museum, New York). His last works were "Under the Arena" (1883), "The Council of Three in Venice" (1885), and "The Death of Alexander the Great" (1886, National Gallery, Berlin), which he left unfinished. Measured by present-day standards, Piloty's work seems deficient in almost all technical qualities, even in its famed color. Its reputed realism now seems mere theatrical pathos. Nevertheless it ranked high in its day and was epoch-making in the development of German painting. Through it the color element, which had been forgotten in the cartoon (q.v.) style that had prevailed since Cornelius (q.v.), was restored to Munich and to German painting.

His brother FERDINAND (1828-95), born in Munich, studied under Schorn at the Academy and worked subsequently under Karl's influence. His name is favorably known through historical frescoes in the National Museum, Munich, the town hall at Landsberg, and the castles of King Louis II. Among his oil paintings may be mentioned "Queen Elizabeth Reviewing her Army in Sight of the Armada" (Maximilianeum) and "Sir Thomas More in Prison" (Wiesbaden Gallery). He also deserves notice as an illustrator for the Schiller and Shakespeare galleries. Consult: K. A. Regnet, in *Münchener Künstlerbilder*, vol. ii (Leipzig, 1871); Ferdinand Pecht, in *Deutsche Künstler des 19. Jahrhunderts*, vol. iii (Nördlingen, 1881); *Modern Artists*, published by F. G. Dumas (Paris, 1882); Richard Muther, in *Allgemeine deutsche Biographie*, vol.

xxvi (Leipzig, 1888); F. Rosenberg, in *Geschichte der modernen Kunst*, vol. iii (ib., 1889).

PILPAI, pil'pi. See BIDPAI.

PILSBRY, pilz'bri, HENRY AUGUSTUS (1862-). An American conchologist, born in Iowa City, Iowa. He was a student at the University of Iowa, from which, in 1899, he received an honorary Sc.D. He devoted himself especially to the study of the mollusks, and after 1888 was special curator in the Department of Mollusks in the Philadelphia Academy of Natural Sciences. Beside numerous papers in scientific journals he published a *Manual of Conchology* (26 vols., 1888-1911); *Marine Mollusks of Japan* (1895); *Barnacles of the United States* (1907).

PILSEN, pil'zen (Boh. *Plezeň*). The second largest city of the Austrian Crownland of Bohemia, situated in a fertile valley at the confluence of the Mies and the Radbusa, 68 miles southwest of Prague (Map: Austria, C 2). It is well laid out and has many fine structures, among which are the Gothic St. Bartholomew's Church (1292), with the highest spire in Bohemia, 335 feet; a town hall in Renaissance style, built in 1558, containing the banquet hall in which Wallenstein (q.v.) received the oath of fidelity from his generals; a number of museums; various schools and Gymnasias; and a municipal brewery. The brewery occupies a complete district of the town, the cellars alone being 4 miles long. Pilsener beer is famous all over the world. Besides its breweries Pilsen has wire works, ordnance works, bell foundries, paper mills, refineries, glass-blowing establishments, copper works, potteries, etc. The city is governed by a burgo-master and a council of 36 members. Pop., 1910, 81,165, mostly Czechs.

In its early days the city was fortified and during the Hussite wars it suffered severely. In 1634, 24 followers of Wallenstein were hung in the market place. The first printing press in Bohemia was set up in Pilsen (1468).

PILT'DOWN SKULL. See MAN, SCIENCE OF, ANCIENT TYPES.

PILUM. See JAVELIN.

PILZ, pilts, VINCENZ (1816-96). An Austrian sculptor, born at Warnsdorf, Bohemia. He studied at the Vienna Academy, at first painting, then sculpture under Kähssmann and Bauer, and in Rome (1849-55) was the pupil of Tenerani and Cornelius. After his return to Vienna he was influenced by Führich and afterward by Rahl, under whose direction he produced numerous reliefs, statues, and groups. These include "Science and Commerce," for Windsor Castle; the two "Winged Horses" in front of Memorial Hall at Philadelphia; and in Vienna the "Nephtune Group" at the Exchange, 6 statues of antique celebrities for the Museum, 10 of composers for the Conservatory, and several of generals for the Arsenal, besides many others for various public buildings.

PIMA, pē'mā. One of the leading tribes of the Piman stock (q.v.). Before being collected upon Gila River and Salt River reservations, Arizona, where they now reside, they roamed, jointly with the Papago, who are virtually the same people, over all the territory from the middle Gila southward to Sonora, Mexico. According to their own traditions, which seem to be confirmed by archeological evidence, they formerly lived farther to the northeast, in the Salado River valley, where they had permanent pueblo towns and irrigating canals. Being driven out by hostile tribes, they gradually

moved down the Gila valley, halting on their way long enough to build and occupy the noted Casa Grande ruins. In their new homes on the Gila they ceased to build substantial structures and contented themselves with dome-shaped huts of poles covered with thatch and earth. They retained their agricultural habit, fertilizing their fields by means of extensive irrigation canals, and cultivating corn, beans, pumpkins, melons, and cotton, men and women working together. They also prepare a sort of bread from the mesquite bean and a liquor from the great Zaguara cactus. The women make pottery and weave beautiful water-tight baskets. (See Colored Plate of INDIAN BASKETS, under BASKET.) They were brought under the influence of Spanish missionaries at an early period, but revolted under their chief, Don Luis, in 1751, destroying all the missions, with every other Spanish settlement in their country. They were subdued after about two years of fighting and have since remained at peace with the whites, although until recently they were obliged continually to defend themselves against the raiding Apache. They bear a high reputation for courage, industry, and honesty. They number 4236. For about a century the weaker Maricopa (q.v.) have been associated with them. Consult Frank Russell, "The Pima," in *Bureau of American Ethnology, Twenty-sixth Annual Report* (Washington, 1908). See PIMAN STOCK.

PIMAN (pé'man) **STOCK**. An important group of cognate tribes occupying nearly the whole of the west coast and Sierra Madre region of Mexico and Arizona from the Gila River southward into Jalisco, and including, besides other tribes and subtribes, the Huichol, Mayo, Opata, Papago, Pima, Tarumari, Tepehuan, and Yaqui. As a rule they are sedentary and agricultural, nearly in the culture state of the Pueblo tribes, but perhaps not quite so far advanced in house building. Owing to the nature of their country, which makes intercommunication generally difficult, their systems of government are usually communal rather than tribal. Although as a body not aggressive, some of their tribes, notably the Yaqui and Tepehuan, have maintained a determined resistance to the Spanish and the Mexicans. The whole number may be about 120,000, of whom the Tarumari make perhaps one-half. Consult Frank Russell, "The Pima," in *Bureau of American Ethnology, Twenty-sixth Annual Report* (Washington, 1908).

PIMENTO, PIMIENTO. See ALLSPICE; PEPPER.

PIMLICO, pim'li-kō. See FRIAR BIRD.

PIMPERNEL (OF., Fr. *pimpernelle*, from ML. *pimpernella*, *pimpnella*, *pipennella*, *pinipennella*, with the original initial *p* assimilated to the following, *bipennella*, *bimpennella*, *bibanella*, *pimpernel*, from Lat. *bipennis*, two-winged, from *bi*, two + *penna*, *pinna*, wing), *Anagallis*. A genus of annual and perennial plants of the family Primulaceæ, natives chiefly of temperate climates, with beautiful but small flowers. Several species are cultivated in flower gardens; others are weeds. Among the best known are the scarlet pimpernel (*Anagallis arvensis*), introduced into the United States and also known as poor man's weatherglass, from the quick closing of the flowers at the approach of a storm; the blue pimpernel (*Anagallis cœrulea*), a form of the preceding; and the bog pimpernel (*Anagallis tenella*). These are all European species. The water pimpernel (*Samolus valerandi*), also

called brookweed, is a plant of the same order and of almost world-wide distribution, growing in watery, gravelly places. It has racemes of small white flowers.

PIN (AS. *pinn*, from ML. *pinna*, pin, nail, peak, Lat. *pinna*, *penna*, feather, wing, fin, pen). Probably the pin in its most primitive form of a spike, thorn, or fish bone was employed long before the earliest needle and thread as a means of fastening a garment together. (See NEEDLE.) Among the remains of the lake dwellers of central Europe have been found a great number of pins—some of bone, others of bronze. Many of these are quite elaborate, with ornamental heads, while others are rudely fashioned. Some have double stems, and a few have been found in form exactly like the modern safety pin. Examples of artistically wrought pins are found among Egyptian as well as Greek remains. Ancient Roman bronze pins and bone hairpins, with ornamental heads, have been found at Pompeii. The Romans also made very elaborate fibulæ, the prototype of the modern brooch. As a requisite of the toilet pins of iron wire were made in England during the fifteenth century; brass wire pins were introduced from France in 1540 by Catharine Howard, Queen of Henry VIII. The invention of the process of drawing wire was the foundation of modern pin manufacture, and for years the industry was confined to the two countries, France and Germany, where this process was invented. Brass wire pins were first made in England in 1826. The industry spread rapidly, so that within 10 years it was well established at Gloucestershire, Bristol, Birmingham, and London, and the pin makers of the last-named city had formed a corporation.

At first pins were made by filing a proper length of wire to a point and then twisting a piece of fine wire around the other extremity. The complete process involved 13 or 14 operations, requiring the labor of as many different persons. Naturally most of these processes were performed by hand tools as distinguished from modern automatic machinery, and in many cases a whole pin was made at a time, and it may be said in passing that in 1775 the American Congress offered a premium of £50 for the first 25 dozen domestic pins equal to those imported from England. In 1797 a solid-headed pin was made by Timothy Harris, of England. The blanks were placed in a two-part mold in which prints at the proper place represented the pin head. Into this mold an alloy of lead and antimony was poured, which solidified and formed a solid head to the pin. The most important improvement was the machine invented by Lemuel Wellman Wright, of the United States, in 1824. This made solid heads to the pins by a process in principle like that used for nail making, viz., by driving a portion of the pin itself into a countersunk hole. The action, however, was automatic and consisted in an arrangement by which the wire was seized in two small grooved cheeks. When both cheeks are placed face to face, the wire is held tightly in the groove with a small portion projecting, a small ram or hammer connected with the machine strikes on the projecting portion described, and compresses it into a small cupshaped depression, and thus the head is formed. In 1831 a machine for making perfect solid-headed pins was invented by John Ireland Howe, a physician in Bellevue Hospital, New York City. The following year a company was organized to make

pins after his patents, which, six years later, moved to Derby, Conn. Samuel Slocum, referred to below, began the making of pins in the United States in 1838, using a machine he had invented but not patented in America.

The modern automatic pin-making machine completes the pin in all respects except the coloring and polishing. The pin is formed from wire—iron for the cheapest pins, hardened crucible steel for the best, and brass for the great majority. A reel of wire as it comes from the wire drawer is placed in the rear of the machine, and the end of the wire is taken hold of by a pair of nippers, which pull it over a straightening board and pass it on completely straightened until it is seized by two cheeks, when a cutter descends and cuts it off, leaving the projecting part for the head; on the withdrawal of the cutter the hammer flies forward and makes the head as before described; the cheeks open, and the pins drop upon a sloping metal plate, finely grooved, down which they slip with the heads upward, until the end which is to be pointed comes in contact with a cylindrical roller with a grinding surface, which soon grinds points upon them by the operation of two or three ingenious arrangements; the first is that the grooved surface of the plate by which the pins descend terminates a little above the grinding roller, then a slight depression is given to the sloping plate and also to the roller, so that one end is an inch or two lower than the other; therefore, as the pin descends the groove and is thus brought down the inclined plate until it lies on the smooth part, where it is highest, and its end in contact with the grinding roller which is revolving, the pin itself is compelled to turn round by the friction of the roller and gradually descends from the upper to the lower part of the inclined plate and then falls into a box placed to receive it. These operations are performed so rapidly that they can scarcely be perceived by the eye, and the pins, beautifully pointed, fall into the box in a stream at a rate of from 200 to 400 a minute. They are then washed in hot water and potash or soda or tumbled in sawdust, washed again, tinned, and prepared for papering.

Samuel Slocum, of Connecticut, invented the first pin-sticking machine. It was introduced into Dr. Howe's factory in 1841. The modern sticking machine is worked by two operatives; one feeds the machine with pins, the other with papers. The first part of the machine is a box, about 12 inches long by 6 inches broad and 4 inches deep; the bottom is made of small square steel bars, sufficiently wide apart to let the shank of the pin fall through but not the head, and they are just as thick as the space between the papered pins. The lower part of the bottom of the box is made to detach itself as soon as the row of pins is complete, and row after row at regular intervals is received and passed down a corresponding set of grooves, until they reach the paper, which, as before described, is pinched into regular folds and pierced to receive the pins, which come exactly to their places and are pressed into them.

The same general process is followed in the making of safety pins, only here the process is more complex, since not only must the wire be cut and pointed, but it must be bent to the desired shape, and in certain styles of pins a sheath or catch for the point must be attached. The machines are entirely automatic in their action and require but little attention.

Enamel-headed pins are largely made at Aix-la-Chapelle, Germany. Enamel, or glass, is spun into a rod about $\frac{1}{8}$ of an inch thick. The end of this glass is kept viscous by a gas jet. Into this soft substance the workman plunges the pin shank and by a complex whirling motion detaches a bulbous mass from the rod, which adheres as a head to the pin.

Black or mourning pins are made of iron wire, heated in a muffle till the proper tint is obtained; or they are coated with a suitable varnish, which is afterward hardened by storing the pins.

Statistics. The chief pin-manufacturing centres are located as follows: in France; at Aix-la-Chapelle, Germany; at Birmingham, England; and, in the United States, principally in Connecticut. In 1850 there were four pin factories in the United States, having a combined capital of \$164,800 and a combined annual product of \$297,550. In 1900, 50,167,817 gross of pins were produced, valued at \$898,054. Of these 47,338,429 gross were common or toilet pins; 1,189,104 gross were hairpins, 1,640,284 gross were safety pins. In the 1910 census of manufactures separate statistics were not compiled for pins, they being included with needles. Consult Longman and Loch, *Pins and Pin-cushions* (London, 1911)

PIÑA (pē'nyā) **CLOTH** (Sp., pineapple). A very beautiful fabric made of the fibres of the leaves of the pineapple plant (*Ananas sativa*) and other allied species (See BROMELIA.) It is of a delicate, soft, transparent texture and a yellowish tint. This cloth, which is made in the Philippines by the natives, resembles horsehair cloth, because the threads both of warp and weft are each single unspun fibres, consequently only small pieces can be made; the workers have, however, a plan of joining the fibres of the coarser kinds end to end, so as to make warp threads of considerable length. Piña cloth is very strong, and the better sorts far excel the finest lawns in texture.

PINACATE (pin'ā-kā'tā) **BUG**. Any of the tenebrionid beetles of the genus *Eleodes*, especially common in the western United States. They are large, smooth, clumsy, wingless black beetles, which congregate in large numbers under stones and pieces of wood. They defend themselves when disturbed by elevating the hinder portion of the body and discharging an oily fluid.

PINACEÆ. One of the two families of conifers, according to current classification. They are distinguished in general from the other family (Taxaceæ) by the distinct cones and the dry seeds. See PINE.

PIN'AFORE, H.M.S. A comic opera, words by Sir William S. Gilbert and music by Sir Arthur Sullivan (qq.v.), first produced in London, May 25, 1878; in the United States, Jan. 15, 1879 (New York).

PIN'AKOTHEK' (Ger., from Gk. *πινακothήκη*, *pinakothēkē*, picture gallery, from *πίναξ*, *pinax*, picture, *θήκη*, *thēkē*, receptacle). Among the Hellenes, a term used to designate a room or building near a temple, for the preservation of pictures brought as votive offerings to the gods. The Romans applied it to the entrance to the atrium of a house, which often contained statues, pictures, and other objects of art. Pinacoteca is the usual Italian term for a gallery of paintings; but the most celebrated collection bearing this name is the Old Pinakothek in Munich, erected in 1826-36, after designs by Klenze, the

architect of the Glyptothek. The New Pinakothek was completed in 1853, and in it are placed the works of contemporary artists. The former is one of the most important in Europe. It owes its origin to the collection of the Bavarian rulers, begun in the sixteenth century, to which were added in 1805 the pictures of the Düsseldorf Gallery, rich in Netherlandish paintings, and the Boisseree collection of German primitives. The Old Pinakothek is especially rich in early German paintings, among which are the most important group of Dürers (14) in any collection, including his own portrait and the "Four Apostles." The Flemish and Dutch schools also are well represented. The collection of Rubenses, numbering over 80 examples, is the largest and most important in the world. There are 36 Van Dycks, 22 Rembrandts, 18 Brouwers, good examples of Terboch, Pieter de Hoghe, Steen, and of both Ruysdaels. Among the important Italian pictures are three Raphaels and eight Titians. One of the corridors of the building is divided into 25 alcoves frescoed by Cornelius, with works illustrative of the history of the fine arts in the Middle Ages. The lower story of the building contains 9000 drawings by the old masters, and a cabinet of more than 300,000 engravings. Consult the official catalogue and publications of the gallery; and for reproductions, the publications edited by Karl Voll (Munich, 1905) and Franz von Reber (Leipzig, 1908).

PINANG'. See BETEL.

PINAR DEL RÍO, pé-när' dél ré'ó. A province of Cuba, occupying the west end of the island (Map: Cuba, B 4). Its area is 5000 square miles. The Cordillera de los Organos, reaching a height of 2500 feet, runs lengthwise through the province, and the land slopes gradually to the coasts on either side, which, especially in the southwest, are low and marshy. The south slope is the celebrated Vuelta Abajo, where the finest tobacco in the world is grown. Tobacco is the main product. Sugar cane, coffee, and fruits, and in the lowlands sea-island cotton, are also grown, and there are extensive lumbering and some cattle raising and copper mining. Pop., 1914, 257,893. The capital is Pinar del Río.

PINAR DEL RÍO. The capital of the province of the same name in Cuba. It is situated on the south slope of the mountains, 90 miles southwest of Havana, with which it is connected by rail (Map: Cuba, B 4). The principal buildings are the Governor's palace, the institute, and the armory. It is the centre of the tobacco industry of the Vuelta Abajo, and a good road connects it with the port of Coloma. Pop., 1899, 8880; 1907, 10,634.

PINARIA GENS. An ancient patrician clan at Rome, who, with the Potitii, were believed to have entertained Hercules when that hero, having killed Geryon (q.v.), came to Italy and there fought with Cacus (q.v.; see also HERCULES). Another story declared that the Potitii perished because, instead of performing the rites themselves, they handed them over to slaves of the state. Consult Livy, i, 7; Dionysius of Halicarnassus, *Antiquitates*, i, 40; Georg Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

PINASTER. A kind of pine (q.v.).

PIN BORER, or SHOT BORER. Any of several of the bark-boring beetles (family Scolytidae), which in issuing from their food plants

leave holes through the outer bark that are usually very small. See AMBROSIA BEETLES; BARK BEETLE.

PINCH (from OF., Fr. *pincer*, to pinch, of unknown origin). A term used in connection with mineral deposits to indicate a marked narrowing of the vein or bed. Pinches may be caused by movements in the rocks or by irregularities of deposition.

PINCHBACK, PINCKNEY BENTON STEWART (1837-). An American lawyer and politician of African descent, born at Macon, Ga. He was educated in the public schools in Cincinnati, Ohio, commanded colored troops in the Federal army during the Civil War, and was a Louisiana State Senator in 1868-71. He was lieutenant governor of Louisiana in 1871-72 and acting Governor in 1872 and was elected to Congress in the latter year. Early in 1873 he was named United States Senator for Louisiana, but the seat was contested and decided against him. In the same year he served as commissioner to the Vienna exhibition from Louisiana, was made a member of the Board of Education of that State in 1877, and served as a trustee of the Southern University in 1883 and 1885. He studied law at Straight University and was admitted to the bar in 1886.

PINCHBECK (named from its inventor, Christopher Pinchbeck, a London clockmaker of the eighteenth century). An alloy of copper and zinc, usually in the proportion of nine parts of the former to one part of the latter. It has a color resembling red gold and was formerly largely used in making watchcases and similar articles in imitation of gold, but has given place entirely to the so-called gold-filled ware.

PINCHE MARMOSET. See Plate of MONKEYS, AMERICAN.

PINCHE'S, THEOPHILUS GOLDBRIDGE (1856-). An English Assyriologist. He was born in London, learned his father's trade of die sinking, but at 19 began to study Assyrian. In 1900, after 22 years of service, he retired from the British Museum, where he had been employed in the department of Egyptian and Assyrian antiquities. He had an important part in the publication of the *Cuneiform Inscriptions of Western Asia* and the *Cuneiform Texts from Babylonian Tablets*, both issued by the British Museum, and wrote many articles in Hastings's *Dictionary of the Bible*. He published, besides, *The Old Testament in the Light of the Historical Records and Legends of Assyria and Babylonia* (1902; 3d ed., 1908); *The Bronze Ornaments of the Palace Gates of Balawat* (1902); *The Religion of Babylonia and Assyria* (1906); *The Amherst Tablets* (1908); *An Outline of Assyrian Grammar* (1910).

PINCHOT, pin'shō, AMOS RICHARDS ENO (1873-). An American lawyer, social reformer, and political leader. A brother of Gifford Pinchot, he was born in Paris, France, where his parents were visiting. He graduated from Yale in 1897 and studied law at Columbia and at the New York Law School. During the Spanish-American War he served with the First Volunteer New York Cavalry in Porto Rico. In 1900-01 he was deputy assistant attorney for New York. Interested in social service and sociology, he wrote numerous articles on the conditions of the poor and on industrial organization. In the organization of the Progressive party he was one of Roosevelt's prominent supporters. In 1914, however, Pinchot began to criticize severely G. W. Perkins, chairman of the

executive committee of the party, because of his connection with the trusts, and within a year he had identified himself with the Republicans. He helped to found the Pinchot School of Forestry at Yale and became a trustee of the People's Institute.

PINCHOT, GIFFORD (1865–). An American forestry expert and political leader, born at Simsbury, Conn. He attended Phillips Exeter Academy, graduated from Yale in 1889, and studied forestry in England, France (at the Nancy Ecole Nationale Forestière), Germany, and Switzerland. Upon his return to the United States Pinchot undertook, on the estates of George W. Vanderbilt (q.v.) at Biltmore, N. C., the first systematic forest work ever done in America. His work received such wide attention that he decided in 1893 to establish himself in New York as a consulting forester. Appointed in 1896 secretary of the forest commission of the National Academy of Sciences, he reported in the next year that wastefulness of forest resources was prevalent throughout the country. In 1897 Pinchot became an agent of the Department of the Interior and in 1898 Chief of Forestry. In 1901 he was made head of the Bureau of Forestry, a branch of the service which in 1905 was transferred by Act of Congress to the Department of Agriculture; in this capacity he served until 1910. For his important service in connection with conservation, see the article on that subject. During the same period he served on commissions concerned with public lands, government scientific work, administrative efficiency, inland waterways, and country life. In 1909 it was charged by Pinchot and some of his assistants that the Interior Department had facilitated the granting of claims to Alaskan coal lands when the claims were of doubtful legality, and, secondly, that the Secretary of the Department, Richard A. Ballinger (q.v.), had reversed the Roosevelt-Garfield policy of withdrawing the valuable water-power sites. Ballinger had also declined to allow Pinchot control of the forests on the Indian reservations. When President Taft upheld Ballinger, some of Pinchot's assistants appealed to the press, and Pinchot himself wrote a letter to Senator Dolliver to be read in the Senate. In it he reflected upon the good faith of the administration. In January, 1910, Pinchot was dismissed by the President for insubordination. The entire matter was made the subject of inquiry by a joint committee of Congress, the majority of which exonerated Ballinger. Public opinion was largely on the side of Pinchot. The controversy went far to sharpen the division between the progressive and conservative factions of the Republican party and to alienate Taft and Roosevelt, Pinchot's champion. In 1910 Pinchot was elected president of the National Conservation Association. In 1912 he was an energetic supporter of Roosevelt in the formation of the Progressive party; in 1914 he was the candidate of that party for United States Senator from Pennsylvania, but failed of election. Together with his mother and brother, Amos Pinchot (q.v.), he founded the Pinchot School of Forestry at Yale. Gifford Pinchot attempted to do relief work in Belgium in 1915, but was expelled by the German authorities because his sister was the wife of Sir Alan Johnstone, British Minister at The Hague. His writings include: *The White Pine* (1896); *A Study of Forest Fires and Wood Production in Southern*

New Jersey (1897); *The Timber Trees and Forests of North Carolina* (1897); *The Adirondack Spruce* (1898); *Primer of Forestry* (1899); *The Fight for Conservation* (1909); *The Country Church* (1913). See CONSERVATION.

PINCIAN (pín'shi-an) **HILL**, or **MONTE PINCIO**, món'tà pin'chò. A hill at Rome, 164 feet in height, forming a spur of the Quirinal (q.v.), from which it is separated by a small valley. It was not included among the famous seven hills of Rome or regarded as a part of the earlier city. It was famous as the site of magnificent gardens, including those of Acilius Glabrio, of the Anicii, where the Villa Medici now stands, and of Lucullus (see LUCULLUS, GARDENS OF), and therefore bore the name of Collis Hortorum. It is now the fashionable promenade of Rome and commands fine views of the city and the surrounding country. Consult K. Baedeker, *Central Italy and Rome* (15th Eng. ed., Leipzig, 1909), and S. B. Platner, *The Topography and Monuments of Ancient Rome* (2d ed., Boston, 1911).

PINCKNEY, CHARLES (1758–1824). An American statesman, born at Charleston, S. C. He studied law and was chosen to the Provincial Legislature before he was 21 years old. He was a member of the South Carolina Provincial Congress in 1785, and in 1787 he was a delegate to the National Constitutional Convention. He was Governor of South Carolina from 1789 to 1792 and in 1790 presided over the convention which framed the State constitution. From 1796 to 1798 he was again Governor and from 1798 to 1801 was a member of the United States Senate. From 1802 to 1805 he was Minister to Spain and secured a renunciation on the part of that country of her claims to the Louisiana territory. He was again Governor in 1806–08, was a member of the Legislature in 1810–12, and was a strong advocate of the War of 1812. From 1819 to 1821, in the National House of Representatives, he opposed the Missouri Compromise. He was a man of liberal ideas and favored the abolition of primogeniture in South Carolina, the removal of Jewish disabilities, and a system of free schools. He wrote a series of letters signed *Republican* (1800), which strongly advocated the election of Jefferson to the presidency.

PINCKNEY, CHARLES COTESWORTH (1746–1825). An American soldier and statesman, born at Charleston, S. C., son of Charles Pinckney, Chief Justice of South Carolina. He was educated in England, at Oxford and the Middle Temple. After studying for a time at the Royal Military Academy at Caen, France, he returned to America in 1769 and began the practice of the law at Charleston. He served in the first Provincial Congress of South Carolina in 1775, was elected captain of a provincial regiment in the same year, and became colonel in September, 1776. He was afterward one of Washington's aids-de-camp, participated in the battles of Brandywine and Germantown, and, returning to the South in 1778, joined the expedition to Florida. In 1783 he was promoted to be brigadier general, but, the war being over, he returned to his practice at Charleston. He was a distinguished member of the United States Constitutional Convention in 1787, of the State Convention which ratified the Federal Constitution, and of the convention which in 1790 framed a constitution for South Carolina. Sent to France in 1796 as United States Minister, his reception

was refused, and he was threatened with arrest by the Directory, which forced him to leave the country the year following; nor on his return to France as a joint commissioner with Elbridge Gerry and John Marshall was his reception more favorable. (See X. Y. Z. CORRESPONDENCE.) Talleyrand assured the commissioners that a gift of money was a necessary preliminary to the negotiations and that a refusal might bring on war. Pinckney is said to have answered: "War be it, then; millions for defense, sir, but not one cent for tribute!" On his return to the United States a war with France seemed imminent, and he was appointed a major general. He was the Federalist candidate for Vice President in 1800 and for President in 1804 and 1808 and was the third president general of the Society of the Cincinnati.

PINCKNEY, THOMAS (1750-1828). An American diplomat and soldier, born at Charleston, S. C. In 1753 he was sent to England with his brother, Charles Cotesworth Pinckney, to be educated, was admitted to the English bar in 1770, and returned to Charleston in 1772. Entering the Continental army as a lieutenant in 1775, he served as aid to Gen. Benjamin Lincoln, D'Estaing, and Gates successively, taking a conspicuous part in the battles of Stono Ferry (June 20, 1779) and of Camden (Aug. 16, 1780), at the latter of which he was wounded and taken prisoner, remaining in confinement until the close of the war. He was Governor of South Carolina in 1787-89, presided over the State Convention which ratified the Federal Constitution in 1788, was a member of the State Legislature in 1791, and served as Minister to England in 1792-94. In November, 1794, he was sent on a special mission to Spain, where he negotiated an important treaty (signed Oct. 27, 1795), guaranteeing to the United States the free navigation of the Mississippi, with privileges of deposit at New Orleans for at least three years, and setting the boundary of west Florida at the thirty-first degree of latitude, from the Mississippi to the Appalachicola. Returning in 1796, he was the Federalist candidate for Vice President in this year and was a Federalist member of Congress in 1799-1801. In the War of 1812 he served as major general in command of the Sixth Military District. Subsequently he retired from public life and spent his last years in Charleston. Consult C. C. Pinckney, *Life of General Thomas Pinckney* (Boston, 1895).

PINCKNEYA (Neo-Lat., named in honor of C. C. Pinckney), *GEORGIA BARK*, or *FEVER TREE*. A small tree, *Pinckneya pubens*, occasionally found in low or swampy land in Florida, Georgia, and South Carolina. It belongs to the family Rubiaceae, has large oval leaves and beautiful terminal clusters of purple-spotted flowers. The bark is used by the country people in intermittent fevers as a substitute for quinine.

PINCKNEYVILLE, pink'ni-vil. A city and the county seat of Perry Co., Ill., 62 miles southeast of St. Louis, Mo., on the Illinois Central and the Wabash, Chester, and Western railroads (Map: Illinois, F 9). Coal mining and flour milling are the chief industries, and there are timber interests. The water works are owned by the city. Pinckneyville adopted the commission form of government in 1915. Pop., 1900, 2357; 1910, 2722.

PINC-PINC, or **TINC-TINC**. See GRASS WARBLER.

PINDAR. See PEANUT.

PINDAR (Gk. Πίνδαρος, *Pindaros*). The most famous of Greek lyric poets. He was born near Thebes in Boeotia. A conservative in politics and religion, a singer of the athletic prowess of the old Æolian and Dorian nobility, he seems to belong to a more ancient order than that of the great Athenians of the fifth century B.C. Apart from the magnificence of his style, the chief points of interest in Pindar for us are that: (1) he was before the recovery of parts of Bacchylides (q.v.) from an Egyptian papyrus the only Greek lyric poet who could be studied in a considerable body of work; (2) he is the representative of a provincial, colonial, and in some ways larger Greece than that in which we are wont to see only a foil to Periclean Athens; (3) he is the first extant Greek writer to proclaim the immortality of the soul and to portray a future judgment; (4) he shows us the Greek myths in transition from their treatment by Hesiod, the older epic, and the lost lyrics of Stesichorus to the forms which they assumed upon the Attic stage.

Only the outline of his life is known. His earliest extant ode, the tenth Pythian, dates from about his twentieth year, before which time he is said to have studied under the best musical and poetic masters of Athens and Thebes and to have been the pupil or the rival of the Boeotian poetesses, Myrtis and Corinna. An early poem, overlaid with mythic ornament, is said to have called forth from Corinna the famous admonition: "One should sow with the hand and not with the whole sack." Pindar's family belonged to the noble clan of the Ægeids, which had widespread connections in Thera, Sparta, and Cyrene. His deep religious feeling caused him to cultivate intimate relations with the priesthood of the great shrines, especially that of Delphi, where his name was publicly honored for centuries. He seems to have traveled widely to all parts of the Greek world, from which his national reputation brought him commissions. At the court of Hiero (q.v.) in Syracuse he may have witnessed the famous eruption of Mount Etna, so magnificently described by him in his first Pythian ode and by Æschylus in the *Prometheus Bound*. He composed hymns or encomia for the priests of Ammon, for Alexander of Macedon, Arcesilaus of Cyrene, Theron of Agriguntum, Hiero of Syracuse, and for the noblest families of Thessaly, Rhodes, Corinth, Ægina, Athens, and Tenedos. No other Greek poet has so wide a geographical range. None presents so vivid a picture of the dazzling diversity of greater Hellas; none so adequately expresses the underlying spiritual unity preserved by the common language and religion and the tradition of the great Panhellenic temples and games. His Hellenic patriotism has been questioned because he says so little of Marathon and Salamis and so little in praise of Athens. As a citizen of a "Medizing" state, however, he could hardly have said more. Tradition has it that he said too much to please the Thebans, who fined him for the line cited from a lost dithyramb: "O splendid, violet-crowned, glorious Athens, famed in song, pillar of Hellas, city divine." The legend adds that the reward bestowed by the Athenians more than paid the fine.

Pindar and his contemporary Simonides (q.v.) represent the culmination of the Greek choral lyric composed with music to be sung by trained choruses of youths and maidens, as distinguished

from the personal lyric of a Sappho or an Alcæus, which was recited or half chanted to a slight accompaniment on the strings. Only fragments remain of Pindar's hymns to the gods, peans, dithyrambs, processional odes, dancing songs, dirges, and encomia. Of the *Pæans* considerable fragments were found by Grenfell and Hunt in 1906. (Consult the *Oxyrhynchus Papyri*, part v.) But we possess virtually entire the four books of his Epinician or triumphal hymns composed in honor of the victors at the four great national games—the Olympian, Pythian, Isthmian, and Nemean (See ISTHMUS; NEMEA; OLYMPIC GAMES; PYTHIAN GAMES.) The victor in the Olympic games received such honors as Rome and the modern world would bestow only upon the triumphant soldier. The victory was celebrated on the spot by festivities, usually impromptu, and later at the victor's home by triumphal processions, banquets, and serenades, often repeated for many anniversaries. If the victor was rich or had wealthy patrons, a Pindar, a Simonides, or a Bacchylides would be commissioned to write a special hymn to be sung during the procession or at the banquet by a trained chorus of his comrades. A large part of such a poem was conventionally predetermined. The poet's task was to ennoble the commonplaces by stately and melodious utterance, to transfigure the whole in the light of the splendor and magnificence of the Olympian or the Pythian festival. To this end Pindar employs the myth, which fills the central portion of the ode and often seems to have little connection with the immediate theme, but which closer study shows to be chosen with an art that we can sometimes only divine, either to express the dominant mood of the occasion or to connect the hero with the mythic past. The English reader may compare the treatment of the legend of the golden fleece in the fourth Pythian ode with the leisurely epic handling of the same theme in Morris's *Life and Death of Jason*.

It is customary to describe Pindar's sublimity by comparing him to the eagle or to the lonely Alpine peak. His style is untranslatable and indescribable. Horace compares it to a torrent that has burst its banks. (Consult *Odes*, iv, 2, 1-32.) Boileau, Cowley, Gray, and the long line of eighteenth-century authors of Pindaric odes thought to reproduce it by jerky, irregular rhythms, abrupt transitions, and bombastic diction. Matthew Arnold praises it as "the grand style in simplicity." Myers's beautiful translation into archaizing English prose reproduces the matter excellently, but hardly the manner. The best translation is that of Myers (London, 1899). Carey is the most readable of the older translators in verse. The chief editions are those of A. Böckh (4 vols., Leipzig, 1811-21), Fennell (2d ed., complete, New York, 1893-99), Bury (ib., 1890-92), Gildersleeve, *Olympian and Pythian Odes* (ib., 1885), and O. Schröder (1908). Comment and criticism will be found in Croiset's *Pindare* (2d ed., Paris, 1886); G. S. Farnell, *Greek Lyric Poetry* (London, 1891); Fracassoli, *Le odi di Pindaro* (Verona, 1894). in the "Introduction" to Gildersleeve's edition and numerous notes by Gildersleeve in various volumes of *The American Journal of Philology* (Baltimore); in R. C. Jebb, *The Growth and Influence of Classical Greek Poetry* (Boston, 1894); Gilbert Murray, *A History of Ancient Greek Literature* (New York, 1897); in *Journal*

of *Hellenic Studies*, vol. iii (London, 1882); W. C. Wright, *A Short History of Greek Literature* (New York, 1907); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i, part i (6th ed., Munich, 1912).

PINDARIS. See PINDHAREES.

PINDEMONTE, pēn'dā-mōn'tā, IPPOLITO (1753-1828). An Italian poet, born at Verona of a noble Veronese family. He was educated at Modena, and in 1778 he went to Rome, where he was admitted into the Arcadia. Traveling much and living awhile in London he acquired familiarity with foreign and, particularly, English literature. The *Poesie Campestri* (1788) show clearly the influence of Gray and Young. His novel, *Abarotte*, a mixture of satire and autobiography, resembles Rasselas, while his tragedy, *Arminto* (1797-1804), imitates certain scenes of Shakespeare and has traces of the Ossian poems, perhaps also of Klopstock. His *Epistole* and *Sermoni* were written with the intention of imitating Horatian satire. His chief claim to consideration is the translation (1809-22) of the *Odyssey* into blank verse. He represents the influence of foreign literatures on the Italian during this period of transition and is a link between the idealistic literature of the eighteenth century and the romantic period of the Restoration. Consult the edition of his *Poesie originali* (Florence, 1858); the *Arminto* (in the 3d ed. of Verona, 1812); the *Odissea* (Florence, 1891); Montanari, *Storia della vita e delle opere di Ippolito Pindemonte* (Venice, 1856), S. Peri, *Ippolito Pindemonte*.

An elder brother of Ippolito was GIOVANNI PINDEMONTE (1751-1812), also a poet of some merit, whose *Baccanali* and *Coloni di Canda* are tragedies in the manner of Alfieri, but whose later tragedies have the Shakespearean freedom. Some of his characters are drawn with mastery, and their passions are delineated with skill. His lyrics, expressive of political feeling and hastily written, are not without merit. He rose high in political circles at Venice and became Podestà of Vicenza, but, falling into disfavor, he had to seek refuge in France in 1796. In 1802 he played a part in the legislative body at Milan. Consult his *Opere drammatiche* (Bologna, 1804-05) and his *Poesie e lettere*, edited by Biadego (ib., 1883); C. Pugliesi, *G. Pindemonte nella letteratura e nella storia del suo tempo* (Milan, 1905).

PINDHAREES, pīn-dā'rēz, or **PINDARIS** (Marathi, *Pindhāri*, *Pendhāri*, plundered, from *pendha*, bundle of grass + *hāri*, one who takes). The name of marauding companies who remained in arms after the fall of the Mogul Empire. They received no pay, but kept whatever they were able to plunder. Eventually, between 1804 and 1817, they became in effect a formidable warlike state, dangerous to English rule, and the terror of the native populations. In the year 1816 alone they destroyed 339 villages in British territory. The next year Lord Hastings, with forces amounting to 120,000 men and 300 guns, completely routed the united Mahratta and Pindhāree armies, consisting of 200,000 men and 500 guns. From this blow the Pindhārees did not recover.

PIN'DUS. A general name applied to the mountain range of north Greece, between Epirus and Thessaly, and to the branches issuing from it. See GREECE.

PINE (AS *pin*, from Lat *pinus*, Skt. *pīrn*,

PINES

PITCH OR YELLOW PINE (*Pinus palustris*).
Saw Palmetto in foreground.

WHITE PINE (*Pinus strobus*).

PINES

1. DWARF PINE. (*Pinus Pumilio*).
2. SUGAR PINE. (*Pinus Lambertiana*).

3. BARK OF BULL PINE (*Pinus ponderosa*).
4. BULL PINE (*Pinus ponderosa*).

pine; connected with Gk. *πινυς*, *pitys*, OIr. *ith*, grain, Skt. *pitu*, sap), *Pinus*. A genus of trees of the family Pinaceæ, about 80 species being recognized. Nearly two-thirds of the species are natives of the northern part of the Western Hemisphere, the others occurring in the temperate and subarctic portions of Europe, Asia, and in Africa, extending as do some of the American species into the tropics upon the high mountains. The genus is readily distinguished by narrow, linear, needle-like leaves, growing usually singly or in clusters of two, three, or five, surrounded at their bases by a sheath of membranous scales; and in bearing its seeds in cones which usually mature the second year, some species the third

GROUPING OF PINE NEEDLES IN SHEATHS.

1, *Pinus monophylla*; 2, *Pinus pinaster*; 3, *Pinus sabina*; 4, *Pinus lambertiana*.

or later years. Pines embrace some of the most ornamental and useful trees, their size varying from shrubby specimens, which usually grow at high elevations or latitudes, to trees of great size.

Pines grow in almost every kind of soil and situation, from the bleak mountain side to the plain of almost pure sand. They are more or less gregarious in habit and frequently cover extensive areas to the almost total exclusion of other species, as in the pine barrens of North America. The thickened epidermis and reduced surface of the needles check transpiration and fit the trees admirably for the situations in which they often grow.

One of the most scientific systems of classification, that given by Engelmann in the Transactions of the St. Louis Academy of Science for 1882, is based upon rather technical characters. By others artificial groupings are made, based on the number of leaves in the cluster and the position and character of the cones. The following scheme, adapted from Veitch, shows the relationships of some of the more common species:

Strobus, leaves in bundles of five; cones pendulous; scales thin, blunt; seeds winged—*excelsa*, *lambertiana*, *monticola*, *strobilus*.

Cembra, leaves in fives; cones erect or horizontal; seeds large, obscurely winged—*albicaulis*, *balfouriana*, *cembra*, *flexilis*.

Edulis, leaves in bundles of one to five; cones subterminal; scales thickened; seeds large, very obscurely winged—*monophylla*, *parryana*, *edulis*, *cembroides*.

Tæda, leaves in threes; cones subterminal or lateral; scales much thickened, with sharp prickles; seeds winged—*coulteri*, *palustris*, *ponderosa*, *tæda*.

Pinaster, leaves in twos; cones lateral, often clustered, mostly persistent; scales thickened, blunt or spiny—*contorta*, *echinata*, *muricata*, *pinaster*.

Sylvestres, leaves in twos; cones subterminal, small, mostly falling off; scales slightly thickened; seeds with elongated wings—*banksiana*, *halepensis*, *resinosa*, *sylvestris*.

The white pine (*Pinus strobus*) is one of the most important timber trees of North America. Its range extends from Newfoundland to Minnesota and southward to the mountains of Georgia. It attains a height of 75 to 150 feet, with a diameter of 4 feet. The wood is white or light yellow, soft, straight-grained, and not very resinous, although some resin is obtained from it. It is easily worked and is largely used in building, cabinetwork, etc., being especially in demand for doors, frames, window sash, blinds, shingles, etc. This tree is becoming scarce in the northern United States and the adjacent parts of Canada. It is one of the most rapid-growing coniferous trees and as an ornamental tree has no superior in the northeastern part of the United States. It is propagated from seed, and the young seedlings required some shade. It is not considered as hardy as the Scotch pine, but is longer lived. This species has been extensively planted in Europe, where it is commonly known as the Weymouth pine.

The yellow, long-leaved, or Georgia pine (*Pinus palustris*), a tree of the widest distribution and the greatest economic importance of all in the South Atlantic and Gulf States, ranks second among American pines. It is found in the sandy and gravelly soil from a region near Norfolk, Va., in a belt about 125 miles wide, to Texas, following the contour of the coast, and is readily distinguished by its long leaves, 9 to 15 inches long, and its cones, which are rather larger than those of other species that accompany it. The average height of the mature tree is about 100 feet, with a diameter of from 2 to 3 feet, tapering very gradually. The wood is heavier and stronger than that of any other pine on the market. The layer of sapwood is rather thin, and the heartwood is prominently marked by the annual rings. The timber is used in all kinds of building, being especially adapted to ship carpentry, bridge building, flooring, etc. Large quantities are exported annually, and the building operations of the Southern States are almost wholly dependent on it. The tree is very resinous, and wherever the sapwood is laid bare there is an abundant flow of resin, which is used largely in the manufacture of naval stores, turpentine, rosin, pitch, tar, etc. The industry ranks second only to the lumber interests. The leaves are utilized for the production by distillation of an oil closely resembling the oil of turpentine, and for the production of pine wool, made by boiling with alkalies, the resulting fibre being used in upholstering.

Two species associated with the Georgia pine in its lower limits are the Cuban pine (*Pinus heterophylla*), very similar to the Georgia pine in size and manner of growth, but considered somewhat less valuable, and the loblolly or old field pine (*Pinus tæda*). The loblolly pine springs up in abandoned fields, soon affording

a supply of timber and wood for fuel, the quality of which varies widely with the conditions under which it is grown, approaching the long-leaved pine in quality when grown in the forest, but considered inferior when grown

LOBLOLLY OR OLD FIELD PINE (*Pinus taeda*).

in open fields. Another valuable species of the Southern and Eastern States is the short-leaved pine (*Pinus echinata*), a tree that attains a height of 75 to 120 feet, with a diameter of about 2 feet, and that ranges from New Jersey and Pennsylvania through southern Illinois to Arkansas and eastern Texas, in some places occurring in almost pure forests. The wood is heavy, hard, coarse-grained, but strong, and is largely used for the framework of buildings, weatherboarding, railway ties, car and other building. It is less resinous than the long-leaved pine, but in importance ranks next to that species in the South. The jack pine or scrub pine of the Northern States is *Pinus divaricata* or *Pinus banksiana*. It abounds from New Brunswick to the Mackenzie River and southward about the Great Lakes, furnishing the cover to the extensive pine barrens of that region, especially in Michigan. It is of little value except for fuel. Next to the white pine perhaps the most valuable species in the North is the red or Norway pine (*Pinus resinosa*), which is found from the Gulf of St. Lawrence to Manitoba and south to Minnesota and Pennsylvania. It occurs as trees 60 to 100 feet tall and 2 feet in diameter, often forming extensive forests upon dry sandy soils. The wood is light, hard, elastic, resinous, and durable except when in contact with the ground. Its uses are similar to those of the short-leaved pine farther south. The Northern pitch pine (*Pinus rigida*), which occurs throughout the northeastern portion of the United States and adjacent Canada and as far south as Tennessee and Georgia, is of little value except for fuel and charcoal, but, although rich in resin, it is little used, the Georgia or yellow pine yielding the principal supply of the market. The Jersey or scrub pine, that abounds in barrens from Long Island to southern Indiana and southward to Alabama, is *Pinus virginiana*.

Among the important species of the Pacific region may be mentioned the sugar pine (*Pinus*

lambertiana) and the bull pine (*Pinus ponderosa*). The former is one of the largest of the genus, the trees attaining a height of 150 to 300 feet and more than 10 feet in diameter. It occurs through Oregon and California. The tree trunks are straight and without branches for a considerable portion of their height. The timber is of excellent quality, solid, straight-grained, does not warp, and is easily worked, so that it is in demand for finishing lumber and cabinetwork. The tree exudes a resin which when burned has a sugar-like flavor, hence the name. The seeds of this and many other species of Western pines are eaten in considerable quantities as nuts. The bull pine, which has several well-marked varieties of diverse utility, is found from the Rocky Mountains to the Pacific coast, where it attains a height of 100 to 150 feet and a diameter of 5 to 6 feet; occasional trees are found 250 feet high and 10 feet in diameter, but it is rather smaller in the Rocky Mountain region. In the Pacific coast region the timber is heavy, hard, strong, and fine-grained; farther inland it is coarser-grained, harder, and more brittle. The lodge-pole pine, so called on account of its former use, is *Pinus contorta murrayana*. It is found from Alaska to California and eastward through the Rocky Mountain region, where the trees often grow in great numbers almost to the exclusion of other species. In the southwestern part of the United States are four species known as Piñon pines (*Pinus parryana*, *Pinus cembroides*, *Pinus monophylla*, and *Pinus edulis*). These various species found from Colorado and Utah to Texas and California are chiefly known for their large edible seeds called piñons. These are eaten as nuts (see NUT). The trees are for the most part small and of little value except for their seeds and for fuel. Among the Mexican species of pines the most valuable and interesting are *Pinus ayacahuite* and *Pinus montezumae*, trees of considerable size, the former somewhat resembling the white pine of the United States.

In Europe the most valuable as well as the most widely distributed species are *Pinus sylvestris*, *Pinus laricio* with its varieties, and *Pinus halepensis*.

The Scotch pine or Scotch fir (*Pinus sylvestris*) occurs in immense forests, sometimes mixed with spruce fir, in some European countries, and is the only species indigenous to Great Britain. It attains a height of 80 to 100 feet and a diameter of from 2 to 4 feet and is frequently seen with very large branches resembling trunks. It is of quick growth and has been known to attain the age of 400 years. Its very resinous and durable timber, known as red deal and red pine, is highly valued, being used in house and ship carpentry. There is great difference, however, in the timber grown in different soils and situations, inferior white, soft, and comparatively worthless grades being produced in rich soils and sheltered situations. Several varieties yield very superior timber. The Scotch pine is valuable also on account of its turpentine, tar, pitch, and resin. Oil of turpentine is sometimes distilled from the cones and the leaves, which last have also been used in Germany for the manufacture of a towlike substance called *Waldwolle* (forest wool), suitable for stuffing cushions, etc.

The black or Corsican pine or black fir (*Pinus laricio*, or *Pinus nigra*), a native of Austria,

but found throughout southern Europe, is another species closely allied to the Scotch pine. It is remarkable for its very long leaves and its content of resin, which is more abundant than in any other European tree. It often attains a height of 140 feet upon sandy soils and has been employed to prevent sand drifting. Its timber is of little value, but a great part of the turpentine of the maritime districts of France is obtained from it. It yields also part of the Burgundy pitch in the market. The Aleppo pine (*Pinus halepensis*), a native of the south of Europe, Syria, etc., is a very graceful tree of moderate size, with slender leaves in pairs. It yields a liquid resin or turpentine, which is extracted from it in Provence and elsewhere and sold as Venice turpentine. The wood is extensively used in the Levant for shipbuilding. The pinaster or cluster pine (*Pinus pinaster*) is another important European species. It is found on the shores of the Mediterranean and also in the Himalaya and in China. Like the black fir, it has been largely used in France for covering waste sandy tracts. The timber is of inferior quality, but it yields large quantities of resin and Bordeaux turpentine.

The stone pine (*Pinus pinea*), a tree with a broad umbrella-shaped head, forms a characteristic feature of the scenery of the Mediterranean and is very often introduced in paintings. It is the *Pinie* of the Germans, the *pignon* of the French. The seeds, which do not ripen till the fourth year, are large, abound in a fixed oil, and when fresh have a sweet taste resembling that of almonds, like which they are used in Italy and other countries. Their use, however, is almost entirely confined to the countries in which they are produced, as they very soon become rancid. The wood is useful and beautiful. The cembra pine or Swiss pine (*Pinus cembra*), which grows in the central part of Europe and the south of Siberia, is a stately tree, with more persistent lower branches than in most pines. It has rigid leaves in groups of five and produces edible seeds (cembra nuts), which, although extracted with difficulty, are much used in Siberia, this fruit being so much prized that trees are often cut down to obtain it. The cembra pine yields a pellucid, whitish oil, resembling oil of turpentine, and known as Carpathian balsam. The Himalaya Mountains abound in pines, some of which rival in magnificence those of northwest America. The Bhotan pine (*Pinus coveisa*), much resembling the white pine in botanical characters and attaining a height of 90 to 120 feet, abounds in Bhotan, but is not found in the neighboring countries of Sikkim and Nepal. The wood is durable, close-grained, and so resinous as to be used for flambeaux and candles. The cheer pine (*Pinus longifolia*) of India, where it is often cultivated as an ornamental tree, is of graceful appearance. It is abundant on the crests of hills in the lower Himalaya, growing at a lower elevation than other pines. It is much valued for its resin, and the wood is used in India as a substitute for European deal. Most of the turpentine produced in India is from this and the preceding species. *Pinus insularis*, a species occurring on the higher elevations in the Philippines, has a wood resembling the yellow pines of the United States, and it is of considerable importance for building purposes. Of the European species introduced in the United States, the Scotch pine has proved best adapted to the

climate and soils. It is frequently planted as an ornamental. *Pinus laricio* has been introduced into the United States, and its variety *austriaca*, known as the Austrian pine, appears especially adapted to the prairie regions. The dwarf pine (*Pinus pumilio*) is an alpine species whose stems are usually prostrate.

Schwarz, *Longleaf Pine in Virgin Forest* (New York, 1907); G. B. Sudworth, *Forest Trees of the Pacific Coast* (Washington, 1908); G. R. Shaw, *Pines of Mexico* (Jamaica Plain, Mass., 1909); R. T. Baker, *Research on the Pines of Australia* (Sydney, 1910); A. T. North, *The Yellow Pine* (St. Louis, 1913); J. S. Bates, *Chemical Utilization of Southern Pine Waste* (Montreal, 1914); G. R. Shaw, *The Genus Pinus*, published by the Arnold Arboretum (Jamaica Plain, Mass., 1914); H. S. Betts, "Western Pines as a Source of Naval Stores," in *United States Department of Agriculture, Bulletin No. 116* (Washington, 1914); "European Pines," in *New Miscellaneous Bulletin*, No. 6 (London, 1915).

PINE, ROBERT EDGE (1730 or 1742-90). An English portrait and historical painter, born in London. He was the son of John Pine, the engraver, and probably his pupil. He painted portraits, such as those of George II, of the Duke of Northumberland, and of Garrick (in the National Portrait Gallery); a series of scenes from Shakespeare, some of which afterward appeared in *Boydell's Shakespeare*; and historical compositions, including "Lord Rodney Aboard the *Formidable*" (Town Hall, Kingston, Jamaica). About 1784 he came to America and settled in Philadelphia, where his time was completely taken up with portraiture. Among his sitters were General Gates, Charles Carroll, Robert Morris, George Read, Thomas Stone, Mrs. Reid (Metropolitan Museum, New York), and Washington (1785). The portrait of Washington was engraved for *Irving's Life of Washington*, but it is weak in characterization. An historically interesting canvas "Congress Voting Independence," now in the Historical Society, Philadelphia, was begun by Pine and completed by Edward Savage. After Pine's death many of his pictures were collected in the Columbian Museum in Boston, since destroyed by fire. Consult Hart, *Congress Voting Independence* (Philadelphia, 1905).

PINEAL (pin'-e-al) **BODY** (from Lat. *pinea*, pine cone, from *pinus*, pine), or **EPIPHYSIS**; sometimes called the pineal gland. The pineal body is an unpaired, upward and forward outgrowth of the midbrain of vertebrates. It appears as a small, ovoid body 6 millimeters in length, of a reddish-gray color, projecting downward and backward between the anterior pair of corpora quadrigemina. Its function has only lately become known. Experimental researches seem to indicate that the structure is a gland, or at least has an internal secretion, which is believed to influence during early life the mental and physical growth, the development of the reproductive organs, and the deposition of subcutaneous fat. Dana and Berkeley report a favorable influence in stimulating the mental development of backward children. Comparative anatomists speak of the pineal body as a rudimentary sense organ—probably an eye. In many fossil mammals and reptiles a depression or

hollow in the parietal bone occurs known as the parietal foramen, which is thought to have contained a rudimentary eye. This view is supported by the fact that in some lizards, and especially in the New Zealand sphenodon (see TUATARA), a parietal organ of this kind is well developed, although it lies beneath the skin and is doubtfully functional. Where the parietal eye is thus developed, it is connected with the brain by a special nerve, and both are formed from the epiphysis. In other cases, where there is no parietal eye, the epiphysis is frequently quite short and is sometimes hollow, the cavity being known as the pineal ventricle. Consult C. P. McCord, *The Pineal Gland in Relation to Somatic, Sexual, and Mental Development* (Chicago, 1914). See ORGANO-THERAPY.

PINEAPPLE (AS. *pinappel*, from *pin*, pine + *appel*, apple). The fruit of *Ananas sativus*, the pineapple plant, which grows from 2 to 4 feet high, producing a single axis to which are attached long, stiff, rough-edged sword-shaped leaves. The individual plant produces only a single very fragrant and palatable fruit, which varies greatly in size, 4 to 5 inches being the usual diameters and 6 to 10 inches the prevailing lengths of ordinary market specimens. Very large specimens may weigh 15 to 20 pounds. The pineapple is a native of tropical America and is widely grown in warm climates. For-

PINEAPPLE (*Ananas sativus*).

merly it was an important European greenhouse crop, and the fruits thus produced were of superior quality; but with the improvement of transportation facilities less attention is given to its culture under glass than formerly. The West Indies, Bahama Islands, Florida, Hawaii, the Azores, and parts of northern Africa are the principal regions of production for European and American markets. Queensland supplies the Australian market. According to the thirteenth census Florida produced 778,644 crates of pineapples, worth \$734,090, in 1909. Owing to keen competition with the West Indies, production is not increasing rapidly in Florida. On the other hand, Hawaiian canned-pineapple shipments have increased from 2000 cases in 1901 to 1,500,000 cases in 1913. The value of canned pineapples shipped from the Hawaiian Islands to continental United States was in 1913 \$3,566,000, and in 1915 \$5,986,000, and of pineapple juice \$43,073. The value of pineapples shipped from Porto Rico to the United States in 1915 was \$1,754,000. The value of the Porto Rico crop now amounts to over \$1,250,000 annually. The pineapple succeeds only

in regions where frosts do not occur. A climate having an alternate wet and dry season, with a mean annual temperature of 75° F. to 80° F., appears most favorable. In Queensland the best pineapples are grown in localities having a mean less than 70° F. The plant requires a porous, well-drained soil; otherwise it thrives on a great variety of soils. In Florida the best pineapples are grown on a fine sandy soil, analyzing 94 to 99 per cent silica, and on such soils heavy fertilizing is necessary. Pineapples rarely produce seed. They are propagated commercially by setting out the crown at the top of the fruit, slips from the base of the fruit, suckers from near the base of the stalk, and ratoons from the roots. Suckers are most commonly planted, since these usually produce a crop of fruit in from 14 to 18 months. Crowns or slips require a year longer to come into bearing. The plants are set in rows about 3 feet apart and 18 to 36 inches distant in the row. Once established, a pineapple plantation will endure 8 to 10 years without resetting, suckers replacing the old plants. Little cultivation other than the scuffle hoe is required. Within recent years pineapples have been grown extensively in Florida under sheds. These sheds are built of lath spaced 2 or 3 inches apart and nailed to a light framework 6 to 7 feet high. They protect the plants from frost and excessive heat and greatly improve the quality of the fruit. The cost of putting them up prohibits their use except for the finest varieties. Consult, for an account of the greenhouse cultivation of pineapples, Thompson, *Gardener's Assistant*, vol. v (new ed., by Watson, London, 1902); for outdoor methods and growing under sheds Rolfs, "Pineapple Growing," in *United States Department of Agriculture, Farmers' Bulletin 140* (Washington, 1901). See HAWAIIAN ISLANDS.

PINEAPPLE, VEGETABLE. See MUSKMEION.

PINEAPPLE FAMILY. A family of monocotyledonous plants. See BROMELIACEAE.

PINEAPPLE OIL. See BUTYRIC ESTER.

PINE BARREN MOSS. See PYXIE.

PINE BLUFF. A city and the county seat of Jefferson Co., Ark., 42 miles by rail south by east of Little Rock, on the Arkansas River and at the junction of the St. Louis Southwestern and the St. Louis, Iron Mountain, and Southern railroads (Map: Arkansas, C 3). It is the seat of the State Colored Normal College. Among other fine edifices are Merrill Institute with a gymnasium and free library, the opera house, the courthouse, and fraternal society buildings. The State Fair Association holds annual fairs here. A fine bridge spans the river at this place. The centre of a fertile agricultural section largely interested in cotton growing, Pine Bluff is an important commercial and manufacturing city. It carries on an extensive cotton and lumber trade and has large wholesale interests. Its industrial plants include railroad shops of the St. Louis Southwestern, cotton compresses, cottonseed-oil and meal mills, boiler and sheet-iron works, a foundry, feed mills, large lumber and stave mills, furniture factories, a hardwood-flooring mill, etc. Pop., 1900, 11,496; 1910, 15,102; 1915 (U. S. est.), 17,060.

PINE FINCH, LINNET, or SISKIN. A small North American finch (*Spinus pinus*), closely related to the goldfinch. The upper parts are variegated black and buff; the under parts white, tinged with buff and heavily streaked

with black. It is found throughout North America, wintering as far south as the Gulf and breeding mostly north of the United States, but is erratic in its movements, being abundant some winters and perhaps not seen again for several years. The nest is built in coniferous trees, of twigs and rootlets, and is lined with down and hairs. The eggs are usually four in number, bluish white, thinly spotted with reddish brown. The pine finch feeds on seeds and buds and resembles the goldfinch in habits, but is less sprightly, and its notes are less musical. In England the pine grosbeak is often called pine finch. See GROSBEEK.

PINE GROSBEEK. A large finch (*Pinicola enucleator leucura*) of northern North America, which visits the United States in winter. In general color the male is mottled rose-red above and ashy on the undersurfaces, with two white bands across the wing. The female is ashy gray, with yellowish brown on the crown and rump. This bird lives in the evergreen forests and feeds on the seeds of the pine and spruce. See Plate of BUNTINGS AND GROSBEEKS.

PINE GROUSE. One of the names of the blue or dusky grouse of western America (*Dendragapus obscurus*). See GROUSE.

PINE INSECTS. The insect fauna of the pine is very extensive. In Europe nearly 300 species are found on trees of the genus *Pinus*, and all but about 20 feed on different parts of the tree. In the United States nearly 200 have been recorded, but the total number will probably prove to be nearly double that number. Of the pine insects known in the United States prior to 1890, the species that had occasioned locally the most direct and perceptible injury was the pine moth of Nantucket, but the most widely destructive kinds were the timber borers, and of these the larva of *Monohammus confusor*, known as the sawyer in the Southern pine districts, did the most damage. Next to that insect the white pine weevil (*Pissodes strobi*) does the most damage to timber, since it deforms the trees, causing the growth of gnarled, many-headed trees which except for these attacks would have grown straight and would have been fitted for masts or for the best timber. Some pine borers are noted for their longevity, and may live for years in articles of furniture or in the timbers of houses, if for some cause prevented from pairing and laying their eggs. Much damage has been done in different parts of the United States by bark-boring beetles of the family Scolytidæ, and especially by the species of the genus *Dendroctonus*, which also seriously affect spruce. The pine-destroying beetle of the Black Hills (*Dendroctonus ponderosa*) has done within recent years an enormous amount of damage to the rock pine in the Black Hills region, bringing about a great loss not only to the owners of the timber, but also to the mining interests of that region, from the lessening of the timber supply. The principal attack appears to be made in August, when the beetles migrate in swarms from the dying trees and settle on the living ones, which they attack and infest in large numbers from near the base to the upper part of the main trunk or stem. Remedial work is largely a part of forest management and includes a careful consideration of the proper date for cutting.

The wood engraver bark beetle (*Xyleborus cœlatus*) is the most common and most pernicious of the insects affecting the forests of white pine

in the State of New York and of the yellow pine in the more southern States. *Xyleborus pubescens* feeds mainly under the bark of *Pinus inops*, and the coarse-writing bark beetle (*Tomicus calligraphus*) works in the pitch pine and to a lesser extent in the white pine. There are perhaps 20 more species of scolytid bark beetles which have similar habits in connection with pine trees. Of the flat-headed borers of the family Buprestidæ, about 20 have been found to attack the pine, while rather more than 20 longicorn beetles of the family Cerambycidæ live in the larval state in the wood of the trees of this genus. The white pine weevil (*Pissodes strobi*) lays its eggs in the bark of the topmost shoot of young trees. The larvæ mine in the wood and pith, causing the shoot to wither and die, thereby occasioning a crook or fork in the body of the tree at this point. It is fatal to the growth of these trees, and no effective remedy has been discovered.

The pine moth of Nantucket (*Retinia frustana*), referred to above, causes the death of pine trees in large numbers. The moth lays its eggs on the twigs and the young larva burrows into the wood, ultimately causing the death of the trees. Many insects affect the leaves of pine, including about a dozen sawflies. In the Northwest a butterfly (*Pieris menapia*) lays its eggs upon pine, and the larvæ destroy the leaves. Another butterfly (*Thecla niphon*) does similar work on the pines in Florida and Georgia. Two of the hawk moths, *Lipara combycoides* and *Lipara pinetum*, feed in the larval state upon pine foliage; and the larva of the imperial moth (*Eacles imperialis*) has similar habits. Many other caterpillars are also to be found doing similar work. The larva of a curious little tineid moth (*Gelechia pinifoliella*) mines in the pine needles, and the larva of one of the gall midges (*Diplosis resinicola*) lives in the pitch which exudes from injuries to the pitch pine. Another gall midge (*Diplosis pini-rigida*) makes small galls at the bases of the needle clumps. Several plant lice and scale insects also feed upon the pine, the most notable being the pine-leaf chermes (*Chermes pinifoliæ*) and the pine-leaf scale insect (*Mytilaspis pinifoliæ*), the latter frequently covering pine needles in various parts of the United States with its minute white scales.

Consult A. S. Packard, *Report on Insects Injurious to Forests* (Washington, 1890), and Hopkins, *Insect Enemies of the Pine in the Black Hills Forest Reserve* (ib., 1902).

PINEL, pē'nél', PHILIPPE (1745-1826). A French physician, born at Saint-André (Tarn). He studied medicine at Toulouse (M.D., 1773) and later at Montpellier, and in 1778 removed to Paris. He received a prize for his book on insanity, and was appointed physician of the Bicêtre and the Salpêtrière (asylums). By recognizing insanity as a disease and discarding the old barbarous methods of treatment Pinel won fame. In the Salpêtrière he instituted the scientific study of insanity through a class of clinical medicine, which he continued after his appointment to the chair of medical physics and hygiene, and subsequently to that of pathology, at the School of Medicine in Paris. He was elected to the Institute in 1803. His most valuable works are *Nosographie philosophique* (1798; 6th ed., 1815); *Traité médico-philosophique sur l'aliénation mentale* (1801; 2d ed., 1809), one of the classics of medical

literature, *La médecine olinique* (1802; 3d ed., 1815).

PINE LINNET, or **SISKIN**. See **PINE FINCH**.
PINELO, pé-nà'lo, ANTONIO DE LEÓN. See LEÓN PINELO.

PINE MARTEN. The American marten (*Mustela americana*). See **MARTEN**, and Plate of **FUR-BEARING ANIMALS**.

PINE MOUSE. An American meadow mouse (*Microtus pinetorum*), rusty brown in general color, and distinguished by its long, silky, mole-like fur. It is more subterranean in its habits than others of our mice, and frequently makes long tunnels under the surface, showing raised roofs like those of the moles. It is especially numerous in the pine-wood districts of the Southern States, but in related forms it ranges also north into southern New England and westward throughout the lower Mississippi valley. Consult Vernon Bailey, *North American Fauna*, No. 17 (Washington, 1900), and Stone and Cram, *American Animals* (New York, 1902).

PINERO, pi-nar'ō, SIR ARTHUR WING (1855-). An English dramatist. He was born in London, May 24, 1855, of Jewish ancestry on his father's side. He began the study of law, but abandoned this to become an actor and made his first appearance on the stage at the Theatre Royal, Edinburgh, in 1874. Two years later he went to London and joined the Lyceum Company under Henry Irving, of which he remained a member for five years. He began his career as a playwright with a comedietta called *£200 a Year*, which was produced at the Globe Theatre in 1877. This was followed by a long list of plays, the extraordinary cleverness and technical dexterity of which soon won him recognition as one of the most popular English dramatists of his time. His first success was *The Money Spinner* (1880). The most significant of his early work, however, is the series of successful farces produced between 1885 and 1893. These were *The Magistrate* (1885), *The Schoolmistress* (1886), *Dandy Dick* (1887), *The Cabinet Minister* (1890), and *The Amazons* (1893). After a brief excursion into sentimental comedy in *The Weaker Sex* and *Sweet Lavender*, both of which were written during the period of the farces, Pinero tried his hand at serious drama in *The Profligate*; but it was not till the production of *The Second Mrs. Tanqueray* (1893) that he made a pronounced success in this field. This piece is somewhat artificial in texture and hardly measures up to the standard of some of his later work, but at the time it marked a distinct advance over contemporary English drama and was generally heralded as a masterpiece. It was the first of his plays to receive recognition abroad and is still perhaps his most widely known work, though both *Iris* (1901) and *Mid-Channel* (1909) are superior in tragic quality and craftsmanship. Pinero's best comedies are *The Benefit of the Doubt* (1895), *His House in Order* (1906), and *The Thunderbolt* (1908). Pinero was knighted in 1909. In his later plays, such as *Preserving Mr. Pannure* (1911) and *The Mind-the-Paint Girl* (1912), he returned to the lighter mood of his earlier period. Pinero's greatest contribution to the drama of his country was technical. As a dramatic craftsman he had no rival among English playwrights of the period. His plays were as popular in the United States as in Britain. Consult: prefaces to his *Plays* by Salaman (London, 1891-95);

H. H. Fyfe, A. W. Pinero (ib., 1902); William Archer, *Real Conversations* (ib., 1904); E. E. Hale, Jr., *Dramatists of To-Day* (6th ed., New York, 1911); P. P. Howe, *Dramatic Portraits* (ib., 1914).

PINEROLO, pé-nà-rō'lo (Fr. *Pignerol*). A town in the Province of Turin, Italy, situated on a hill on the left bank of the Chisone, 22 miles southwest of Turin by rail (Map: Italy, A 2). It has an eleventh-century cathedral, a lyceum, a Gymnasium, a technical institute, and a theatre. There are manufactures of woollens, cottons, silks, leather, and paper, and a trade in grain, wine, cattle, fruit, and lumber. Pop (commune), 1901, 18,250, 1911, 20,174, (town), 12,600. Originally a possession of a local Benedictine abbey, Pinerolo passed to the house of Savoy in 1188 and later became a residence city. It was taken by the French in 1536 and in 1631, when it was strongly fortified; its castle was made the prison for the Man with the Iron Mask, Fouquet, and Lauzun. Pinerolo was returned to Savoy in 1696 and its fortifications were demolished in accordance with the Treaty of Utrecht.

PINES, ISLE OF. An island south of Cuba. See **ISLE OF PINES**.

PINES, ISLE OF. A small island in Melanesia, situated near the south extremity of New Caledonia (q.v.), of which it is a dependency. It has an area of 58 square miles, is mostly barren, except along the coast, and has a population, exclusive of convicts, of about 600 New Caledonians and a few European settlers. Since 1872 it has been a French penal station.

PINE SNAKE, or **BULL SNAKE**. A large, robust, colubrine serpent (*Pituophis melanoleucus*) of the southerly half of the United States, often exceeding 6 feet in length, and of a glistening creamy white, blotched with dark brown. It derives its name from the pine lands in which it is found, emits a strong, disagreeable odor, and feeds on eggs, birds, and small mammals. It is harmless, but makes a loud hissing and sometimes even bellowing noise when disturbed, to which fact it owes its name bull

HEAD OF PINE SNAKE.

Showing formation of glottis. a, sheath of tongue, b, epiglottis; c, glottis.

snake; but why it should also be called thunder-and-lightning snake is not so easily explained. Three or four similar species and varieties inhabit dry, sandy regions throughout the interior of the country, especially in the Southwest and in Mexico. These are brighter in color than is the Eastern species. Consult: Lockwood, "The Pine Snake," in *American Naturalist*, vol. ix (Boston, 1874), Abbott, *A Naturalist's Rambles* (New York, 1884); E. D. Cope, *Crocodilians, Lizards, and Snakes* (Washington, 1900); R. L. Ditmars, *The Reptile Book* (New York, 1914). See Plate of **SNAKES**, **AMERICAN HARMLESS**.

PINE SWIFT. The name in the northern coast States of the fence lizard (*Sceloporus undulatus*). It is very common in the pine woods from New Jersey southward. It is entirely harmless and has many interesting habits. See FENCE LIZARD.

PINE-TREE FLAG. A flag used in the Massachusetts Colony, as early as 1700, at first red or blue with a pine tree on a white field, and later white bearing a pine tree in the middle and the motto, "An Appeal to Heaven." This was the flag carried by the first war vessels commissioned by Washington at the beginning of the Revolution.

PINE-TREE MONEY. Money coined in Massachusetts from 1652 to 1682, in the values of a shilling, sixpence, and threepence, so called from the rude figure of a pine tree on one face, while the other bore "New England," with the date.

PINE-TREE STATE. Maine. See STATES, POPULAR NAMES OF.

PINEVILLE. A city and the county seat of Bell Co., Ky., 156 miles east-southeast of Lexington, on the Cumberland River and on the Louisville and Nashville Railroad (Map. Kentucky, G 6). It is a shipping point for the Cumberland coal-mining region. Lumber also is shipped and staves and coke are manufactured. In the centre of the town there are remains of a prehistoric mound. Other noteworthy features include Mayme Johnson Seminary, Continental Hospital and Sanitarium, county infirmary, courthouse, city hall, and the railroad station. Pineville was settled in 1868. Pop., 1900, 2077; 1910, 2161.

PINEVILLE. A town in Rapides Parish, La., on the Red River, opposite Alexandria, and on the lines of the Chicago, Rock Island, and Pacific, the Louisiana and Arkansas, and the Louisiana Railway and Navigation Company (Map Louisiana, E 4). It is the seat of the Louisiana Baptist College and the State hospital for the insane and contains a national cemetery. The town is engaged chiefly in lumbering and farming. The electric-light plant is owned by the municipality. Pop., 1900, 617; 1910, 1212.

PINEY DAMMAR. See DAMMAR.

PINEY TREE. See CALOPHYLLUM.

PINEY VARNISH. See DAMMAR.

PING-PONG. A modified form of lawn tennis (q.v.), played on a table marked to scale, after the model of a full-sized lawn-tennis court. The bat is usually covered with a thin skin like a battledore, but resembles a lawn-tennis racket in shape, while the ball is usually made of light celluloid. Any kind of table may be utilized, but its size should not be less than 5 feet, 6 inches by about 3 feet, nor larger than 10 × 5. The regulation table is 9 × 5, the height of the net, which is stretched across the middle of the table, being regulated at the ratio of three-fourths of an inch for every foot in the length of the table. The game is for two players standing one at each end of the table. The player who first delivers the ball is called the server and the other the striker out. At the end of each game the striker out becomes the server and vice versa. The service is strictly underhand, delivered from behind the end of the table. The ball served must drop on the table top anywhere beyond the net, and is then in play. If it drop into the net or off the table, it counts to the striker out. There is no second

service as in lawn tennis, but the system of scoring is the same as in that game. The game became popular in the United States about 1900, but as it was inherently uninteresting and required comparatively little skill, its vogue was short-lived, and within a few years it had virtually disappeared. Consult Parker, *Ping Pong* (New York, 1902).

PINGYANG, ping'yang' (Korean *P'yeng*, *Phyong*, or *P'yung-Yang*), now called Heijo by the Japanese. A walled city of Chosen (Korea), capital of the Province of South Heian, and one of the most important cities in the country after Keijo, the capital (Map: China, N 4). It stands in an undulating plain on the right bank of the Daido (Tadong) River, about 36 miles above its mouth. Its walls are 20 feet high, run parallel with the river for about 2½ miles, and are loopholed and battlemented and pierced with several gates with imposing towers. The streets are laid out at right angles. Pingyang (or Heijo) is the most ancient city of Chosen, Ki-ja (see KI-TSE), the reputed founder of Korean civilization, having landed here some time after 1122 B.C. The superstitious notion is held by Koreans that the city is boat-shaped (representing the craft on which Ki-ja arrived from China) and that wells must not be sunk within it lest the vessel be scuttled. The water supply of the inhabitants is, therefore, carried in from outside. Two large stone posts about 1½ miles above the town are supposed to be the mooring posts. The tomb of Ki-ja is one of the sights of the city. The Japanese are engaged in extensive improvements. Pop., 1912, 51,832 (7868 Japanese, 43,250 Koreans, and 714 foreigners).

The city is regarded as the military key to Chosen, and in consequence it has suffered much from war. A great battle was fought here in 1593 between the Chinese troops sent to succor Chosen during Hideyoshi's invasion and the Japanese troops under Konishi; and the principal battle of the Japanese-Korea-Chinese War of 1894-95 was fought here Sept. 16, 1894, resulting in the utter defeat of the Chinese, who lost 4000 men. A handsome stone monument in memory of the Chinese General Tso, who led the cavalry, has been erected on the spot where he died, and on a lofty knoll within the city is a monolith erected by the Japanese to their dead.

PINHOEN, OIL OF. See PHYSIC NUT.

PINK (from *pink*, to puncture, to pierce; so called from the jagged edges of the petals), *Dianthus*. A genus of about 70 annual and perennial plants of the family Caryophyllaceæ, chiefly natives of Europe and the temperate parts of Asia. Their beautiful and often fragrant solitary or clustered flowers are borne at the ends of the branches, and have attracted admiration in all ages, some of the species having been long cultivated in gardens. Their cultivation has given rise to many varieties, including single and double forms of many different colors. The species *Dianthus caryophyllus*, including the well-known and widely cultivated carnation (q.v.), clove pink, picotee, or grenadine, is native to southern Europe, where it is found growing wild on rocks and old walls. The common pink, also called feather pink (*Dianthus plumarius*), is the parent species of many cultivated forms. This has always been a favorite ornamental plant on account of its hardness and the beauty and fragrance of its

blossoms. It differs from the foregoing species in having rough-margined leaves and fringed petals. Nearly allied to the common pink is *Dianthus superbus*, found in moist places in some parts of Europe and often grown in flower borders. The maiden pink (*Dianthus deltoides*) is a low-growing perennial frequently cultivated for its dense masses of leaves and flowers. The China or Indian pink (*Dianthus chinensis*) has long been in cultivation and numerous dwarf and double and single flowered varieties of many varied colors have been developed. The sweet William, or bunch pink (*Dianthus barbatus*), is a popular species of easy cultivation and abounds in country gardens. Its flowers are crowded into dense flat clusters at the top of the stem. The varieties are exceedingly numerous and include many highly developed forms. The Deptford pink (*Dianthus armeria*) is a small European species which has become

PINK (*Dianthus plumarius*).

naturalized in the eastern United States. Pinks prefer a rather light, sandy loam soil. They are propagated from seeds and from cuttings. If the plants are to flower the same season, the seeds are sown in heat during February, transplanted when the plants are large enough, and hardened gradually to cool culture until May, when they are set out. Seeds sown in the open during summer produce plants which blossom the following year. The young plants of outdoor sowings are also transplanted as soon as they become crowded and are finally transferred to their flowering position in autumn. Many varieties of pinks are grown as greenhouse plants, and these are usually increased by layers or cuttings. See PLATE OF CARNATIONS; and Colored Plate of MOUNTAIN PLANTS.

PINKERTON, ALLAN (1819-84). An American detective, born in Glasgow, Scotland. In 1842 he emigrated to Canada to escape punishment for his part in the Chartist movement (see CHARTISM), and the same year settled in Chicago, where he opened a detective agency. Before the outbreak of the Civil War he had become widely known, and in 1861 he guarded President Lincoln during the latter's journey to Washington for the inauguration. Soon afterward he was commissioned to organize the

Federal Secret Service Department, of which he was made the head. During all this time he continued his private detective agency in Chicago, and established branch agencies in other important cities. When the changed industrial conditions that followed the war led to strikes and violence, he organized a force of armed men which he hired out to employers and corporations for the protection of their property. This force, known as Pinkerton's Men, played a conspicuous part in some of the most important labor disturbances of the last quarter century, notably in the suppression of the Molly Maguires (q.v.) and in the Homestead strike. (See HOMESTEAD.) Among other well-known cases with which Pinkerton was connected were the capture of the robbers who took \$700,000 from the Adams Express Company's safe on a New York, New Haven, and Hartford Railroad train, on Jan. 6, 1866, and the dispersion of a gang of murderers who for a number of years terrorized all southern Indiana. His sons, Robert A. (died 1907) and William A., carried on their father's work. Allan Pinkerton wrote several books on subjects connected with his experiences, among them: *The Molly Maguires and the Detectives* (1877); *Criminal Reminiscences* (1878); *The Spy of the Rebellion* (1883); *Thirty Years a Detective* (1884); *History and Evidence of the Passage of Abraham Lincoln from Harrisburgh, Pa., to Washington, D. C., on the 22d and 23d of February, 1861* (1891).

PINKERTON, JOHN (1758-1826). A Scottish antiquary and author, born in Edinburgh. He was educated at Lanark grammar school, was articled to a writer to the signet in Edinburgh, abandoned law for literature, settled in London (1781), and resided during his last years in Paris. Among his numerous publications are: *Rimes* (1781); *Select Scottish Ballads* (1783), professing to be ancient, but later admitted by Pinkerton to be partly his own; *Essay on Medals* (1784); *Letters of Literature* (1785); *Ancient Scottish Poems never before in Print, from the Manuscript Collection of Sir R. Maitland* (1786); *The History of Scotland from the Accession of the House of Stuart to that of Mary, with Appendices of Original Documents* (2 vols., 1797). This last work, though valuable for its matter, is disfigured by an attempt to rival the style of Gibbon. Consult his *Literary Correspondence*, edited by Dawson Turner (London, 1830).

PINK'EYE, or INFLUENZA. An infectious disease prevalent among horses, often occurring as an epizootic. The term is also employed for conjunctivitis (q.v.). See INFLUENZA (in animals); FRIT.

PINKNEY, pink'nī, EDWARD COATE (1802-28). An American poet, born in London, England. He was the son of William Pinkney, the well-known Maryland lawyer and orator, and was born while the latter was commissioner in England. He served in the navy (1816-24), was admitted to the Baltimore bar, in the latter year, was made professor of rhetoric and belles-lettres in the University of Maryland, and edited the *Marylander* (1827); but he is best known for a tiny volume of *Poems* (1825), since highly praised by Poe and others and several times reprinted.

PINKNEY, WILLIAM (1764-1822). An American statesman, born at Annapolis, Md. He was educated at King William's Seminary (afterward St. John's College), studied law

under Justice Samuel Chase (q.v.), and was admitted to the bar in 1786. In 1788 he was a member of the State Convention to ratify the Federal Constitution and was elected to the House of Delegates the same year. In 1796 he was appointed by Washington a commissioner to England to determine the compensation due American merchants under the Jay Treaty (q.v.) and secured a claim of \$800,000 for Maryland on the Bank of England. He returned to practice law in Baltimore in 1804 and was elected Attorney-General of Maryland in 1805. In 1806 he was again sent to England as a commissioner to treat in conjunction with James Monroe, then Minister to England, regarding the violation of rights of neutrals. On the return of Monroe in 1807 Pinkney remained as resident Minister until recalled at his own request in 1811. On his return he was elected to the Maryland State Senate, but was appointed Attorney-General of the United States by President Madison. He commanded a regiment of riflemen during the War of 1812 and was wounded at Bladensburg. He was a member of the national House of Representatives in 1815-16 and in the latter year was appointed Minister to Russia and Special Envoy to Naples. He resigned in 1818 to practice law and was engaged in many important cases. In 1820 he was elected to the United States Senate and opposed the admission of Missouri. Consult Henry Wheaton, "Life, Writings, and Speeches," in Jared Sparks, ed., *American Biography*, vol. v (new ed., New York, 1902); also William Pinkney, *Life of William Pinkney* (1853).

PINK ROOT. The root of a species of *Spigelia* (q.v.).

PIN MONEY. In English law, a sum of money paid periodically by a husband to his wife, to be expended for dress and other personal expenses. The origin of the term has never been traced satisfactorily, but writers of some authority assert that it was derived from an ancient tax levied in England for the purpose of supplying the Queen with pins. The practice of providing such an annual sum for the wife's separate use, by means of a marriage settlement, was at one time quite common among the wealthy classes in England. Out of this allowance the wife was supposed to maintain the dignity of her station in the matter of dress, ornament, private benefactions, etc. It was therefore intended to be spent and not accumulated. Accordingly, if a husband pays the wife's personal expenses directly, it is a bar to a claim for arrears of pin money, and, in any event, while the wife continues to cohabit with the husband she cannot collect the arrears for more than one year. However, if she lives separately, all arrears may be collected. If the wife saves anything out of her pin money while living apart from her husband, it becomes her separate property; but if they are living together, such accumulation goes, with her personal property generally, to the husband's representatives on his death, unless he had consented to his wife's saving for her own benefit.

The custom of providing pin money is no longer common in England and never gained favor in the United States, although there are some early decisions which apply the English law to such allowances. A weekly or monthly sum paid to the wife for household expenses, etc., does not correspond to pin money. Sums

given to the wife by the husband voluntarily from time to time, when he does not indicate that they are to be used for a specific purpose, are usually considered as gifts and become the separate property of the wife. See **DOWRY**; **HUSBAND AND WIFE**.

PINNA (Lat. *pinna*, *pina*, from Gk. *πίνα*, *πίνα*, sort of mussel). The popular and generic name of a group of marine mussels with very thin, wedge-shaped shells, tapering to a point at the hinge. The byssus is remarkably long and silky, and by it the species affix themselves to submarine rocks and other bodies, sometimes even to sandy or muddy bottoms. The best-known species is *Pinna nobilis*, of the Mediterranean, the byssus of which was occasionally used by the ancients for fabrics, chiefly as an article of curiosity.

PINNACE (Fr. *pinace*, *pinasse*, from It. *pinassa*, *pinazza*, pinnace, pine, made of pine, from *pino*, from Lat. *pinus*, pine). Formerly a small two-masted vessel, fitted to be propelled by oars as well as sails, and usually employed as a tender to large ships. The French armed pinnace was usually of 60 to 80 tons and carried one large 24-pounder and about 100 men. In the United States navy the term "pinnace" is not used, but in the British navy it is still applied to a large carvel-built boat similar to the American sailing launch.

PINNACLE (Lat. *pinna*, *pinna*, dim. of *pinna*, feather, wing, pin, pen). A termination of tapering form crowning some architectural member. Unknown to ancient art, it was occasionally used in the mediæval Mohammedan and Romanesque styles, but it did not become common until the Gothic period, when it became a most important decorative element of architecture. It crowned buttresses, filled in the four corners of square towers at the spring of the polygonal spire, and rose as a termination of piers or shafts at gable corners. Pinnacles were square, polygonal, or circular and had spires or gables crowned with finials; they had either an open story or solid masonry with engaged colonnettes and arcades. Sometimes they included a niche containing a statue. The main pinnacles on the buttress piers of Rheims Cathedral are 80 feet high. They are of different sizes and of the greatest variety of form and decoration.

PINNATED GROUSE. The prairie chicken. See *Prairie Chickens*, under **GROUSE**.

PINNIPE'DIA (Neo-Lat. nom. pl., from Lat. *pinna*, feather, fin + *pes*, foot). A section of Carnivora, comprising seals, otaries, and walruses, in which the fore and hind limbs are short and expanded into broad, webbed swimming paddles. The hind feet are placed very far back, nearly in a line with the axis of the body, and somewhat incorporated with the tail by the integuments. The body is elongated and covered with short fur or hairs and terminated by a short conical tail. The five toes of each foot are united by the skin and form powerful swimming paddles. The tips of the toes are armed with claws, but they have little power for land locomotion, the typical seals being able only to drag themselves along when out of the water. The ears are small, often only indicated by apertures, which the animal can close under water. The dentition varies, but teeth of three kinds are always present. The canines are always long and pointed, and the molars have sharp cutting edges.

The pinnipeds include three families—the earless seals (*Phocidae*), the eared seals or otaries (*Otariidae*), and the walruses (*Trichechidae*). The seals differ from the walruses by having incisor teeth in both jaws and moderate-sized canines, and from the otaries by the absence of ears and inability to use the hind limbs on land. The eared seals, sea lions, or otaries differ from the typical seals by having small conical ears and in the greater use of the limbs, especially the hind limbs, so that they are enabled to execute a sort of walk. Consult J. A. Allen, *History of North American Pinnipeds* (Washington, 1880), and F. E. Beddard, "Mammalia," in *Cambridge Natural History*, vol. x (London, 1902). See SEAL; WALRUS.

PINN'NULE (from Lat. *pinnula*, dim. of *penna*, feather, wing, pin, pen). In a pinnately compound leaf, one of the subdivisions of the first divisions or *pinnæ*. The term has most frequent application among the ferns.

PINOCHLE, pē'nok'-l (Ger., of uncertain etymology). A game of cards. The modern and more generally adopted game is played with a specially prepared pinochle pack of cards, or with two packs of cards, of which only the ace, king, queen, knave, ten, and nine of each pack are kept—a total of 48 cards in all. The dealer deals four cards at a time, until each player has 12, the next or twenty-fifth card being turned up for trump and placed exposed by the side of the undealt cards. One thousand points are game, and the value of announcements as follows: eight aces, 1000; eight kings, 800; eight queens, 600; eight knaves, 400; double pinochle (i.e., two queens of spades and two knaves of diamonds), 300; ace, ten, king, queen, and knave of trumps, 150; four aces of different suits, 100; four kings of different suits, 40; pinochle (i.e., queen of spades and knave of diamonds), 40; king and queen of trumps (styled a royal marriage), 40; king and queen of any suit not trumps (styled a marriage), 20. The count on each separate hand is 250, including 5 for queens, 5 for kings, 10 for tens, 10 for aces, and 10 for the player who takes the last trick. Generally speaking, the laws of *béziqne* will be found to govern most matters of detail in pinochle.

In the three-handed game all the cards are dealt by four at a time, the last card being turned up for trumps. Should a nine be turned up, the dealer scores 10 points; but where that does not happen, either of the other players holding a nine of trumps may exchange it for the trump card and claim the 10 points, the eldest hand having precedence. Each player "melds," i.e., announces whatever he has in hand, before a card is played, but cannot meld after a trick is taken. Four-handed pinochle is played in the same manner as for three players.

PIÑON, pē'n'yón. A kind of pine (q.v.).

PIÑONCILLO, pē'n'yón-sel'yó. See **PHYSIO NUT**.

PINOS, pē'nós. A town of the State of Zacatecas, Mexico, 65 miles southeast of the capital of the state (Map: Mexico, H 6). It is in the midst of an important mining region, with extensive gold and silver deposits, and manufactures large quantities of mescal. Pop., 1900, 7667.

PINSK. A district town in the Government of Minsk, Russia, situated in a marshy region on the Pina, about 105 miles east of Brest-Litovsk (Map: Russia, C 4). It has a Roman

Catholic church of the fourteenth century, a Realschule, and manufactures of matches, lumber, and leather. The commercial importance of the town has greatly decreased since the construction of the Polissie railways. Pop., 1911, 37,000. Pinsk is mentioned as early as the eleventh century and was formerly the capital of a separate principality. It was captured by the Germans in 1915. See **WAR IN EUROPE**.

PINSUTI, pēn-sōo'tē, CIRO (1829-88). An Italian-English teacher of singing and composer, born in Siena. He studied under his father and played in public at the age of 10. Subsequently he went to England and studied the pianoforte and composition under Potter and the violin under Blagrove. In 1845 he entered the Conservatorio of Bologna, where he became Rossini's pupil. In 1848 he returned to England and gave singing lessons in London and Newcastle. He was also appointed in 1856 professor of singing at the Royal Academy of Music, London. During his life his songs, which number about 200, were very popular. He died in Florence.

PIN'TA. The name of one of the three caravels in which Columbus made his first voyage to America. It was commanded by Martín Alonso Pinzón.

PINTA'DO. See **PETREL**.

PIN'TAIL, or **SPRINGTAIL DUCK**. A common, widespread, and highly esteemed duck (*Dafila acuta*), characterized by the long tapering tail of the drake. It is about equal in size to the mallard, but is more slender. The head is brown, with a white line on each side extending down the neck; the back and sides are marked with waving lines of black and grayish white; the lower parts white; the elongated central tail feathers black. It is a native of all the northern parts of the world, migrates southward in winter, and is a regular visitant of many parts of the Atlantic coasts. It frequents fresh-water lakes and ponds also and is common in winter in the valley of the Mississippi. It breeds from Iowa northward, but chiefly in the interior, and is not known as a summer resident anywhere on the Atlantic coast. Its winter range extends southward to the Mediterranean and the Gulf of Mexico and even to Africa and the West Indian islands. Consult Baird et al., *Water Birds of North America* (Boston, 1884).

Some other birds having long sharp tails are called pintails by sportsmen, as, especially, one of the European sand grouse (*Pterocles setarius*). See **PLATE OF EGGS OF WATER AND GAME BIRDS**.

PINTO, pēn'tó. See **SERPA PINTO**.

PINTO, FERNÃO MENDES (1509 or 1510-83). A Portuguese traveler and one of the first white men to visit Japan (1542-43). He was born at Montemor-o-Velho (Beira). Embarking for the East Indies, his ship was captured by the Turks, and he was sold as a slave. According to his own account his adventures were remarkable. He spent 21 years in Asia and Africa, was 13 times taken prisoner and 17 times sold as a slave. While returning in a pirate junk from Cochín-China to China, his vessel was separated from her companions, and after 23 days on the open sea he sighted the island of Tane (Tanégashima), one of the Luchu Islands (q.v.), where the strangers were welcomed and given a house. They surprised the people by their firearms, which the Japanese quickly imi-

tated, making over 600 guns within five and a half months, and on one of his three later visits to Japan Pinto found firearms in a great many places. To this day, among Japanese country folk, a pistol is called Tanégashima. Hokusai (q.v.) pictured Pinto and his companions with their firearms in his albums. Returning to Portugal in 1558, Pinto lived at court several years and died near Lisbon, July 8, 1583. His posthumous work, *Peregrinação*, appeared at Lisbon in 1614 and was at first supposed to be a sort of Robinson Crusoe romance, but in the main, and apart from personal items, its statements have been confirmed by modern research. An English rendering by Cogan appeared in London in 1663, 1692, and 1891 (*Adventures and Voyages of Ferdinand Mendez Pinto*).

PINTSCH GAS. See GAS, ILLUMINATING AND FUEL; PINTSCH SYSTEM.

PINTSCH SYSTEM. A process for the production of compressed oil gas, used chiefly for lighting railway cars. Ordinary coal gas burned at the pressure of street mains gives an illumination of about four candles to each cubic foot, while oil gas at the same pressure yields about 16 candles to the cubic foot. Compression and storage of coal gas produce a diminution in illuminating power in consequence of the deposition of the rich oily hydrocarbons. This loss, however, is much less in oil gas than in coal gas. Oil gas is made by subjecting petroleum or shale "distillate oils" to a temperature of 900° C. in small D-shaped iron retorts. The retorts are placed one above another and connected in pairs. Oil flows into one end of the upper retort through a siphon and drops into a loose sheet-iron tray, where it vaporizes, the vapors passing downward into the lower retort, where cracking occurs. The gas is of a pale straw color; if brown, the heat has been too intense. The tar and carbon residues are of little value. Young improved the process by washing the gas with the oil as it flows into the retort. By this method no tar is formed; only retort carbon remains. After purification and compression the gas is ready for use. It is usually stored in steel tanks under a pressure of 5-6 atmospheres. The tanks are suspended under railway cars. Before consumption a special valve reduces the pressure to 1-2 inches of water. Either plain or inverted mantle burners may be used. Oil gas is also largely used for lighting buoys as aids to navigation. These buoys are arranged to hold a charge of gas which will last for several months of continuous burning. At 125 pounds' pressure to the square inch, 1 foot of oil gas is equal in illuminating power to about 5 feet of coal gas. The use of oil gas for the purpose of illuminating railway cars is therefore much more economical, and the Pintsch system finds extensive use on all the leading railway lines in the United States. See GAS.

PINTURICCHIO (PINTORICCHIO), pên-tōō-ré-kê-ō (It., little painter) (1454-1513); properly BERNARDINO DI BETTO. One of the foremost Umbrian painters of the early Renaissance. A native of Perugia, he studied under Fiorenzo di Lorenzo (q.v.) and was later influenced by Perugino (q.v.). His early work was at Perugia, Spello, and Siena and consisted chiefly of altarpieces, like the "Holy Family with St. John" (Siena) and "Christ Crucified, with St. Jerome and Christopher" (Borghese

Palace, Rome). In 1480-83 he collaborated with Perugino in the frescoes of the Sistine Chapel, himself painting the "Baptism of Christ" and the "Journey of Moses." Then (1483-84) came his first independent work, the frescoes in the Ara Cœli, Rome, of the life of St. Bernardino. Among other frescoes which he painted in Rome the most important are those of the Borgia apartments in the Vatican, rendered in a courtly and luxurious style. His work at Rome was interspersed with decorative commissions in various Central Italian cities, the most charming and characteristic of which are those of the Collegiata at Spello. Towards the end of his life he removed to Siena, the scene of his most important commission, the lavish decorations of the cathedral library (1503-08), with scenes from the life of Æneas Sylvius (Pope Paul II). The two portraits of the knight Alberto Arringieri (1504) in Siena Cathedral are in his very best style. His last important frescoes were on the vaulting of the choir of Santa Maria del Popolo, Rome (1505). The most important of his later panel pieces are the reliquary (Berlin) and "Christ Bearing the Cross" (1513, Milan). He died and was interred at Siena, where he possessed a house and left a wife and daughters. Though reputed of mean appearance and a man of little culture, he was popular alike with courts and the public.

Pinturicchio was the foremost historical painter of the Umbrian school, as Perugino was its chief religious painter. His winning art represents the quaint medievalism of Umbrian painting applied to decorative work of a more mundane character. At best, it is simple in form, attractive in color, and charming in landscape. Though often marred by raised gold and stucco the decorative effect is usually fine. The assistance of the numerous pupils of his large *bottega* (workshop) is discernible in his frescoes, for which he always furnished the design.

H. and E. W. Blashfield, *Italian Cities* (New York, 1912).

PINUS. A genus of trees. See CONIFERÆ; GYMNOSPERMS; PINE.

PIN/WHEELS. See PYROTECHNY.

PIN/WORM. One of the nematode worms (*Oxyurus vermicularis*) parasitic in the large intestine and rectum of man, especially in children. It is a small white worm, ½ inch long or less and very slender. The females are larger than the males. Unlike many nematodes, the pinworms reproduce directly in their host and have no alternation of hosts or of generations. The eggs are very minute and must be taken into the body with the food or at least through the mouth, but the exact manner of infection is not really known. The presence of these worms is often a matter of discomfort,

but they are rarely so numerous that their presence is a source of danger to the person afflicted.

PINKSTER FLOWER. See Plate of AZALEAS AND RHODODENDRONS.

PINZÓN, pên-thôn', FRANCISCO MARTÍN. A Spanish navigator, brother of Martín Alonso and Vicente Yáñez Pinzón (q.v.). He was pilot of the *Pinta* on the first voyage of Columbus.

PINZÓN, MARTÍN ALONSO (c.1440-93). A Spanish navigator, companion, and patron of Columbus. He was born at Palos and attained distinction as a bold and skillful sailor, making distant and profitable voyages as far as the Guinea coast. Through Fray Juan Pérez de Marchena, prior of the convent of La Rábida, he came to know Columbus, and his enthusiasm was aroused by the scheme of the great navigator. With his brothers, Vicente Yáñez and Francisco Martín, he exerted his influence in the seafaring town of Palos to enlist men for the voyage across the Atlantic. The brothers also lent Columbus the money which he was to contribute as his share of the cost of the expedition. On the first voyage of discovery Martín Alonso commanded the *Pinta*. As the fleet was coasting along Cuba after the landfall on Guanahani Island, he separated from the other two ships in disregard of the Admiral's orders (Nov. 21, 1492). He was the first to discover the island of Haiti, on the coast of which he rejoined Columbus Jan. 6, 1493. He was met with severe reproaches by Columbus, who charged him with treasonable intentions. On the return voyage Martín Alonso, in the *Pinta*, parted company with the *Niña* during a storm and, reaching Bayona in Galicia, sent word to the Spanish monarchs to announce his return. Then he set sail for Palos, which he reached on the same day as Columbus (March 15). As the result probably of privations encountered during the voyage, he died soon after at the convent of La Rábida. Consult: Cesáreo Fernández Duro, *Colón y Pinzón* (Madrid, 1883), J. M. Asensio, *Martín Alonso Pinzón, estudio histórico* (ib., 1893); Henry Vignaud, *Histoire critique de Christophe Colomb* (2 vols., Paris, 1911).

PINZÓN, VICENTE YÁÑEZ (c.1463-c.1523). A companion of Columbus. He was born in Palos and was a younger brother of Martín Alonso Pinzón (q.v.). Pinzón commanded the *Niña* on the first voyage and afterward became the greatest of the seafaring men engaged in discoveries in the New World, down to the time of Magellan. He appears to have made several independent voyages before the close of the century, and it is probable that in 1497 (accompanied perhaps by Vesputius) he reached the mainland of America (discovering Central America) almost simultaneously with Cabot's landing on the continent. He sailed again on Nov. 18, 1499, returning the following September, after discovering the coast of Brazil and the mouth of the Amazon and sailing westward and northward at least as far as Costa Rica. In 1505 he was appointed to command an expedition to the Spice Islands, but Portuguese intrigues prevented him from sailing, and instead he was given charge over the fortifications to be erected in Porto Rico. He was also made Governor of the island with authority to colonize it. He was, however, a seaman rather than

an administrator, and he spent the next year or two trying to get the command of a fleet, which the Portuguese prevented, as he was suspected of designs against their territories. In June, 1508, he finally got away, with Juan Díaz de Solís. They returned in November, 1509, but no record survives as to where they secured their cargo of gold and other New World products. After 1523 we have no records of Pinzón. Consult Henry Harrisse, *Discovery of America* (London, 1892).

PIOMBINO, pyóm-bé'nó. Formerly an independent principality of northern Italy, now a part of the Province of Pisa. It belonged to Pisa from 1233 to 1399, when it became independent under rulers of the house of Appiani. In 1700 it came into the possession of the Buoncompagni-Ludovisi. It was incorporated with France in 1801, but from 1805 to 1814 was ruled as a principality by Elise Bacciochi, the sister of Napoleon. In 1815 it was united with the Duchy of Tuscany.

PIOMBINO. A town in the Province of Pisa, Italy, situated on a promontory projecting into the Tyrrhenian Sea, 40 miles by rail southeast of Leghorn (Map: Italy, C 3). Its ancient walls and ruins of an old castle still remain. The town has a busy harbor and manufactures ironware and oil. Pop. (commune), 1901, 8309, 1911, 18,703. To the north are Etruscan and Roman remains of the town of Populonia, whose site still preserves the ancient name.

PIOMBO, SEBASTIANO DEL. See SEBASTIANO DEL PIOMBO.

PIONEER (Fr. *pionnier*, OF. *peonnier*, foot soldier, sapper, from OF. *peon*, *paon*, *pion*, foot soldier, Fr. *pion*, pawn, from ML. *pedo*, foot soldier, from Lat. *pes*, foot, ultimately connected with Eng. *foot*). A military mechanic or laborer. Originally pioneers were ordinary laborers of the country in which the army was operating. Their name was undoubtedly derived from the fact that their principal duty was to prepare the way for the advance of the troops, cutting down trees, building bridges, removing obstacles, etc. They were the forerunners of the modern military engineer (see ENGINEER CORPS), the engineers or technical troops of Germany being still known as pioneers. Formerly in the British army there were two pioneers to every company of infantry, who collectively worked under a pioneer sergeant, a regimental staff noncommissioned officer. Their equipment consisted of either a pick, shovel, or an axe, and a one-edged pointed sword, the other edge of which was cut like a saw. On the march or on occasions of ceremony they paraded with the noncommissioned staff and in column of route preceded the band. To be a pioneer a soldier had to be a skilled mechanic and had to pass the pioneer instruction course at Chatham. In the organization of the United States army (1914) a pioneer battalion of engineers is a component part of a division. Such a battalion consists of a headquarters, a supply detachment, and three pioneer companies with attached sanitary troops. Total personnel: 15 officers, 494 enlisted men, commanded by a major. They are equipped with 1 map wagon, 7 wagons for tools and explosives, and a pack train of 24 mules. They are also a part of the engineer corps. See ENGINEERING, MILITARY.

PIONEERS, THE. A novel by James Fenimore Cooper (1823). Though the earliest published, it is the last but one in order of the

Leatherstocking Tales, describing the old age of Natty Bumppo and the death of the Indian, Chingachgook.

PIOBBY, pé'ô'rê', PIERRE ADOLPHE (1794-1879). A French physician, born in Poitiers. He became doctor of medicine in 1816 and in 1840 was appointed professor of pathology and in 1850 of clinical medicine at Paris. He devised a new nomenclature which met with no success and invented the pleximeter for mediate percussion, for which he received the Montyon prize in 1828. (See PERCUSSION.) He wrote: *De la percussion médiate* (1828); *De l'hérédité dans les maladies* (1840); *Traité de médecine pratique* (1842-51), *Traité de plessimétrisme et d'organographie* (1866).

PIOTROKOV, pyô'tr'-kôv. A government of Russian Poland, consisting of eight districts and bounded on the north by the Government of Warsaw (Map: Russia, A 4). Area, 4729 square miles. The surface is mostly level and somewhat undulating towards the south. Coal and iron are found in some parts of the government and mined to some extent. The chief rivers are the Warta and the Pilica. Although the soil is not well adapted for agriculture, this is the chief industry. Stock raising is also of some importance. Textiles represent the leading manufacturing industry, of which Lodz and Piotrokov are the two centres in Russian Poland. The government was occupied by the Germans in 1915 (See WAR IN EUROPE.) Pop., 1913, 2,042,300.

PIOTROKOV. The capital of the government of the same name in Russian Poland, situated on the Warsaw-Vienna Railway, about 16 miles southeast of Lodz (Map: Russia, A 4). One of the oldest towns in Poland, it has a number of old churches and monasteries, an old castle, two Gymnasias, and a fine town hall. The chief manufactures are farm implements and textiles. Pop., 1910, 41,181. Piotrokov is one of the oldest towns of Poland, being mentioned as early as the twelfth century. It was fortified by Casimir the Great and received Magdeburg rights in 1404. It was the scene of frequent riots and in 1577 became the seat of the highest tribunal of Great Poland. Piotrokov was captured and strongly fortified by the Germans in 1915. See WAR IN EUROPE.

PIOZZI, pé-ô't'sé', MRS HESTER LYNCH, better known as MRS. THRALE (1741-1821). A noted friend of Dr. Samuel Johnson. She was born at Bodvel, Carnarvonshire, Wales. In her girlhood she learned Latin, French, and Italian and wrote for the *St James's Chronicle*. In 1763 she married Henry Thrale, a well-to-do Southwark brewer, her senior by 13 years. It was no love match, but on the whole turned out well. Dr. Johnson became acquainted with Mrs. Thrale in 1764 and for 16 years spent week ends and summers at Streatham Park, the Thrale estate. By the society there his eccentricities in dress and manners were toned down, and his natural melancholy was neutralized by the presence of a vivacious and charming woman. In his whole career this is the only bright period. Thrale died in 1781, and three years later his widow married Gabriel Piozzi, an Italian musician. Piozzi was a man of talent and honor, but Johnson was displeased and never again saw his good friend. Immediately after their marriage the Piozzis went to Italy, returning to England in 1787. They lived at Streatham till 1795, then at Bachycraig, Flintshire, Wales, and

afterward on the Clwy. Piozzi died in 1809. Mrs. Piozzi passed her last years mostly at Bath, Clifton, and Penzance, and died May 2, 1821. Her only valuable contributions to literature are *Anecdotes of the Late Samuel Johnson* (1786) and *Letters to and from the Late S. Johnson* (1788). While at Florence in 1785, Mrs. Piozzi associated with the Della Crusicans and wrote for the *Florence Miscellany*, afterward ridiculed by William Gifford (q.v.).

Knapp (ib., 1914); also James Boswell, *Life of Johnson* (London, 1791, new ed., by Roger Ingpen, 2 vols., New York, 1909), and the *Diary of Madame d'Arblay* (London, 1842-46, new ed. by C. Barrett, 6 vols., ib., 1904-05).

PIP. A nickname of the hero of Dickens's *Great Expectations*, who on the death of his unknown benefactor, the convict Magwitch, instead of gaining the wealth he had anticipated, is reduced to poverty.

PIP. A disease of poultry. See ROUP.

PIPA, pé'pâ (Neo-Lat., from the native name of the Surinam toad). A South American frog (family Pipidae), the Surinam toad (*Pipa americana*), celebrated for its extraordinary method of carrying its eggs in the skin of the back. It is a peculiar, ugly-looking creature. The whole skin is covered with small tubercles and is dark in color on the upper surfaces but whitish on the underside of the body. Everywhere the skin bears papillae, each with a little horny spike and many with a poison gland at the base. The back of the female is furnished with numerous cells or pouches, in which the eggs are hatched and the young undergo all their transformations. It was not until the process was observed by Bartlett, who watched captive specimens in London (*Proceedings of the Zoological Society*, London, 1896, p. 595), that the method of placing the eggs in this curious nursery was understood. The eggs are produced in the early part of the rainy season, when these highly aquatic frogs have plenty of water about them, and at that time it is very difficult to capture them. In the dry season these frogs collect in swamps and ditches and sometimes come close to or into houses. Consult Hans Gadow, *Amphibia and Reptiles* (London, 1901), and G. A. Boulenger, *Reptiles and Batrachians* (New York, 1914).

PIPAL, pé'pal. See BO TREE.

PIPE. An implement for smoking tobacco, opium, etc. See TOBACCO PIPE.

PIPE (AS. *pipe*, from ML. *pipa*, pipe, from Lat. *pipere*, *pipiare*, to pipe, onomatopoeic in origin). An artificial closed channel, or conduit, for liquids, air, or gases, often under high pressures. Pipes are composed of a great variety of materials, according to the uses to which they are to be put and the cheapness of the various materials in a given locality.

Lead Pipes are known to have been used at Babylon, Rome, and Pompeii and, like all lead pipe until recent times, were made from sheets of lead bent to a pear-shaped section, with the

horizontal joint welded or soldered. About the beginning of the sixteenth century the casting of lead pipes was begun in England, the process having been invented by Robert Brooke. In 1790 an English patent for drawing lead pipe was granted, and a machine was built for pressing lead pipe through dies. As the larger sizes of lead pipe have to be very thick to retain their shape and withstand high pressures, and on account of the high cost of lead pipe and for other reasons, such pipe is but little used now in diameters of more than 2 inches or so. Modern lead pipe is pressed through dies in a continuous length. The molten lead is poured into a cylindrical hole in a hydraulic press. In the centre of the hole is a metal rod or core of the same diameter as the pipe. When the metal begins to solidify the press rises and forces the soft, hot lead through a die, the diameter of which corresponds with the interior diameter of the pipe.

Block-tin pipes are made in the same way as lead, except that they are cold-pressed. Most of the block-tin pipe is used in soda fountains, or to convey beer, or in chemical works.

Cast-Iron Pipes. The general process of casting iron is described under **FOUNDING**. It may be said here that in some of the foundries the core is made by winding a spindle with a machine-made hay rope. Over the rope two or three layers of clay are packed successively, after which the clay is shaped in a lathe, then dried in an oven. This core shapes the interior of the pipe. For the exterior a pattern is placed in a compartment known as a flask. Around the pattern tempered clay and sand are rammed to form a mold for the exterior of the pipe.

MOLD FOR CASTING IRON PIPE.

The flask is then placed in an oven to dry the sand and clay, after which it is placed in a vertical position, the core is centred within it, and the space between the core and the mold is filled with molten iron. After the core is

drawn and the pipe removed, the latter is coated to prevent corrosion. The standard length of cast-iron pipe is 12 feet, and its diameter ranges from about 2 to 60 inches, with occasional larger sizes. The great thickness of shell, which of course increases with the diameter, makes very large pipe too heavy for use where ready means for handling it are not available. This is partly obviated by casting in shorter lengths.

Clay, Earthenware, or Terra-Cotta Pipe. Near the close of the eighteenth century the manufacture of drain tile began to assume importance in England. Other forms of clay pipe followed soon after, and then came the vitrified clay or glazed stoneware pipe now commonly known as sewer pipe. A machine for the manufacture of clay pipe was built at Ottweiler, Rhenish Prussia, about 1858.

Drain Tiles are commonly mere cylinders of baked clay, designedly porous, and without provision for making joints. Sometimes, however,

SOME OF THE MOST COMMON SPECIAL CASTINGS FOR USE WITH CAST-IRON PIPE.

a short length of semicylindrical baked clay is laid over the abutting ends of the tiles. Clay pipe is made by pressing or otherwise forcing the prepared clay (see **CLAY**) through a die, in the case of drain tile, and then cutting it into short lengths; or it is pressed in a mold, consisting of an outer shell, to form the exterior, and a core for the interior, besides which there is a special mold for the socket. After the socket is formed its mold is removed and the straight portion of the pipe pushed through.

To obtain a glaze, salt is placed in the fire holes of the kiln while the pipe is being baked. Upon being volatilized the salt combines with the silica in the clay.

Wood Pipes. Bored logs were used at Boston, in the first public water-supply system in the United States, in 1652, and at Bethlehem, Pa., in the pumping system of water works built from 1754 to 1761. Most, if not all, of these primitive wood pipes were simply logs with holes bored in their centres, and one end of each log tapered off to fit into the bore hole of the next log. Similar pipes are still used, but only in rural districts. Improvements have resulted in a style of pipe with a smooth circular interior and exterior, an asphalt-coated iron or steel band wound tightly around the pipe to give it strength, and a coating of asphalt over both the bands and wood for preserving the ex-

terior from alternate drying and wetting. The joints are made by boring out one end of each pipe to a larger diameter than the other and turning down the other end to a like exterior diameter, then inserting the small end of one pipe in the large end of the next; or both ends of the pipe may be bored, as described, and the space thus formed may be filled by inserting a short length of pipe just thick enough so that its inner side will be flush with the inside of the main pipe.

To avoid the limitations in size incident to bored logs and to secure still greater facility in transportation and construction, particularly in rough country, pipes built up in place from wood staves are now used. Wood-stave pipe is composed of staves cut internally and on the edges (or radially) to form a conduit of the desired diameter. By breaking joints a continuous pipe is secured. The staves are held together and resistance to any desired moderate pressure is secured by using steel bands or rods, provided with screw ends and nuts for tightening.

Since about 1895 smaller sizes of stave pipe, for which the construction just described is not suitable, have been made by winding them spirally with steel rods under tension by means of a machine; a little later small, wire-wound stave pipe was put on the market.

An investigation of the lasting qualities of wood pipe carrying water, made under instructions from the director and chief engineer of the United States Reclamation Service, was published in the August, 1915, issue of the *Reclamation Record*. It dealt with continuous-stave uncoated fir, continuous-stave uncoated redwood, continuous-stave and wire-wound coated fir, and continuous-stave and uncoated Texas, Colorado, and yellow pine, and showed that a life of 12 to 25 years is possible where complete saturation of the wood takes place.

Wood-Fibre Pipes are made to a limited extent and used for conveying gas, acids, and water under relatively low pressures. They are made from wood pulp. (See **PAPEE**.) A thin sheet of pulp is wound around a core until the requisite thickness is obtained. The pipe thus formed is dried, impregnated with a wood preservative, and then has its ends turned in a lathe to form joints.

Wrought-Iron Pipes. The earliest wrought-iron pipes appear to have been made from an overstock of gun barrels early in the nineteenth century. The small end of one tube was screwed into the large end of the other. The pipes thus made were used to convey illuminating gas. The longitudinal joints were lap-welded. The increasing demand for wrought-iron gas pipe led to the adoption of butt-welded pipes of uniform size and thickness, united by sockets or couplings into which the ends of the pipe were screwed. Like the gun barrels, these pipes were welded by hand, a few inches at a time. In 1825 Cornelius Whitehouse invented a process of butt welding which was in its essentials continued in use through the remainder of the century. He first rounded up the iron plate or skelp, then heated half the length of the pipe, and drew it through two dies by means of a chain. The dies pressed the heated metal together. This patent was bought by James and John Russell, pipe manufacturers, one of whom had just patented a process of butt welding by pressing the edges together, but in which only a few inches could be welded at a time.

With the development of steam engineering larger and stronger pipes were demanded. The Russells bent their energies to meeting this demand by improving on the old lap-welding process already described. This appears to have been about 1835, but, whatever the date, their process for lap welding, like theirs for butt welding, involved the main principles still followed. In the recent process of lap welding pipe and tubes the strips or plates of metal are heated, have their edges beveled or scarfed by passing through rolls, and then drawn through a die and formed with edges overlapping, ready to be welded. The partly made pipe or skelp is now heated a second time and welded by passing it through two rolls, the inner lap resting on a stationary mandrel, which corresponds to a blacksmith's anvil. Finally, the pipe thus made is straightened, threaded, screwed into a coupling, and tested by means of water pressure. Butt-welded pipes are now made by drawing a heated plate, by means of tongs, through a conical-shaped die, thus pressing the edges so firmly together that they unite. The further steps in the process are the same as for lap-welded pipe. Iron pipes exported from the United States in 1914 amounted to \$14,338,000 in value.

Pipes are also *drawn* from hollow or cylindrical ingots formed by passing a heated round billet through diagonal rolls and over a mandrel. By reheating and rolling under pressure the ingot is finally brought down to the desired diameter and thickness. It is then annealed, pickled, and cold-drawn, to give it the desired finish. In the Mannesman process, invented in Europe, and patented in America in 1887, pipe is rolled from a solid but heated bar or rod by means of two tapering rolls and a mandrel.

Steel Pipes are made in the same general way as has been described for wrought iron. In addition, they are sometimes cast and are frequently riveted for large sizes, as described below.

Riveted Wrought-Iron and Steel Pipes have their longitudinal and frequently their circular joints riveted instead of welded. Wrought-iron sheets, rounded and riveted, have long been used for stovepipes, and in 1853 a California miner laid a pipe line of ordinary stovepipe to convey water for hydraulic mining. In a few years this sort of pipe, only heavier and better made, was in general use.

Both *spirally riveted* and *spirally welded steel pipe* have been used, and the former is still on the market. In each case plates of steel are wound spirally to form a tube, spiral joints being heated and welded by a machine hammer in one case and lapped and riveted in the other. The sections of pipe thus made are joined in the trench. Steel pipes with *longitudinal locking bar joints* have been used extensively in Australia and the United States. The earliest notable instance, as well as one of the most remarkable pipe lines in the world, is the Coolgardie pipe line, which is 328 miles long and 30 inches in diameter. Water is pumped through it to supply gold fields in the interior, 1313 feet above the source of supply. The pipe is made by bending two plates to semicircular shape and inserting their edges in steel bars with a groove on each side, then applying heavy pressure to both the plates and bars. The circular joints are made with sleeves. The contract for the line was let in 1898. Pipes similar

in construction were introduced into the United States about 1905.

Cement Pipes and Concrete Pipes are made from the materials named. (See CEMENT and CONCRETE.) Cement pipe was molded from sand and cement or cement mortar, but did not come into extensive use. Steel rods and steel nettings

JOINTS FOR PIPE OF VARIOUS MATERIALS.

have been built into concrete pipe to give it greater tensile strength. This form of construction is known as reinforced concrete and is extensively used. Both plain and reinforced concrete are used for large conduits, built continuously in place, instead of being molded in sections.

Pipe Joints may be grouped as calked, screwed, flanged and bolted, and riveted. The

calked joints are used almost wholly for vitrified clay pipe, other than drain tile, and are very largely used for cast-iron pipe. They are sometimes used for steel. Pipes with calked joints generally terminate in an enlarged curved bell or socket at one end and are either the same size and shape as the main pipe at the other end or have a projecting ring. This smaller end is known as the spigot or bell. After one piece of pipe has been inserted in another the space between the hub and the socket is packed with lead or with cement, the lead generally being used for cast-iron pipe. In place of a hub and socket plain-ended pipe may be inserted in sleeves, or pipe of slightly larger diameter, and calked as described. Screwed joints are effected by threading the outer ends of the pipes and screwing them into or upon some form of coupling, also provided with screw threads. Flanged and bolted joints have a projecting ring at each end, with holes drilled through it, parallel to the axis of the pipe. Bolts are inserted in these holes. By using washers or packings of leather, rubber, or soft metal between the flanges, and by turning up the nuts on the bolts until they are tight, very tight joints can be made in this way. Riveted joints have been mentioned in the paragraph on riveted wrought-iron and steel pipes. These joints, longitudinal as well as circumferential, may be made by lapping one edge over the other and riveting the two together; or the two metal edges may be butted against each other, a strap or band placed over the seam, and rivets inserted and headed each side of the seam. The requisite strength of joints is secured by decreasing the space between the rivets and by putting in two or three rows of the same.

Bibliography. The literature of the subject is scattered through the engineering papers, proceedings of engineering societies, and books on the applied arts employing pipe. A paper by Jesse Garrett on "Making Cast-Iron Pipe" in *Journal of New England Water-Works Association* (Boston, September, 1896) contains some interesting historical matter relating to various kinds of pipes used to convey water, besides describing briefly the manufacture of cast-iron pipe. The journal named contains much other material on the manufacture and uses of the various kinds of pipes. Consult also: Crane, "Early History of Gas Pipes," in *Engineering Record* (New York, July 8, 1893), for the wrought-iron pipe; various committee reports on "Coating Cast Iron and Steel Pipes," in *Proceedings of American Society of Municipal Improvements* (Allegheny, Pa., 1897-1900); P. R. Björling, *Pipes and Tubes: Construction and Jointing* (2d ed., New York, 1908); John Sharp, *Some Considerations Regarding Cast Iron and Steel Pipes* (ib., 1914). For a few of the many uses of pipes, see HEATING and VENTILATION; IRRIGATION; SEWERAGE; WATER SUPPLY; WATER WORKS; PIPE LINES.

PIPE CLAY. A term applied to almost any fine clay (q.v.) comparatively free from iron and other impurities, having a grayish-white color, a greasy feel, and high plasticity. Some pipe clays are used for the manufacture of tobacco pipes and white pottery; others are employed for making sewer pipe. Pipe clays are common in the United States and occur in many geological formations, notably the Cretaceous, Tertiary, and Carboniferous. See CLAY.

PIPEFISH. A name given principally to

species of the family Syngnathidae, but applied also to various other species which, like the above, have a long tubular snout. The body is long and slender, and is covered with bony plates firmly connected, so as to form a sort of carapace. The tail is often long and slender and sometimes is used as a prehensile organ. The fins are minute, the pectorals sometimes wanting and the ventrals always. Their food consists of small marine animals and the eggs of fishes, and they may be seen slowly moving about, with curious contortions, poking the long snout into

A PIPEFISH STANDING UPRIGHT IN EEL GRASS.

every crevice in search of food and sometimes assuming a vertical position with the head downward, poking into or stirring the sand. They abound alongshore among the eel grass and when standing on their heads in the midst of it perfectly simulate one of the gently moving blades and are thereby protected from observation. Like the sea horse (q.v.), to which pipefishes are nearly related, the males have brood pouches on the ventral side of the body, usually situated on the underside of the tail, but sometimes farther anterior, formed by two folds of the skin meeting and coalescing in the median line. The young are carried in this pouch until some time after they have escaped from the egg, going out, and returning when alarmed, but at last are turned loose by the pouch bursting. There are about 15 genera and 150 species, small and sluggish, inhabiting the warmer seas, sometimes entering fresh waters. The common pipefish of the Atlantic coast is *Siphostoma fuscum*.

Consult A. C. Gunther, *Introduction to the Study of Fishes* (London, 1880), and G. R. Goode, *American Fishes* (New York, 1888).

PIPE LINES, OIL AND GAS. Wrought-iron or other pipes jointed to form conduits of great length, used to transport petroleum oil or natural gas from the wells or fields to the point of utilization or, in the case of oil, to the refinery or market.

Oil Pipe Lines were first suggested by Gen. S. D. Karns, in November, 1860. His idea was to lay a line from Burning Springs to Parkersburg, W. Va., and let the oil gravitate to the Ohio River, where it could be loaded and shipped. The distance was about 36 miles. The line never was laid. In 1862 J. L. Hutchinson, of New York, laid a siphon over a hill from the Tarr Farm to a refinery at Plumer, Pa. In 1863 he laid a second line, 3 miles in length, through which he pumped oil from the Sherman well to a refinery, but the joint leakage was so great that both these lines were abandoned.

The first successful line was laid in 1865 by Samuel von Syckle, of Titusville, Pa., and was 4 miles in length. Other lines followed, numerous companies were organized, and consolidations were effected. The new mode of transportation met with violent and riotous opposition from teamsters and others interested in hauling oil in wagons and the destruction of or tampering with the pipes was frequent. In 1875 a 4-inch line, about 60 miles long, was laid from the lower oil country to Pittsburgh. The second long pipe line was laid from Bear Creek to Cleveland, Ohio. It was 111 miles long, 6 inches in diameter at the outset, and 5 inches in diameter after passing the final pumping station. It being found more advantageous to locate the refineries on the seaboard and the Great Lakes, pipe lines were rapidly laid to the chief cities so situated in the northeastern part of the United States. In 1879 a through pipe line from Olean, N. Y., to the Atlantic coast at Bayonne, N. J., was opened, and by 1892 the National Transit Company alone had secured control of or built a vast mileage of trunk lines from the oil fields to the Great Lakes and the Atlantic Ocean. Besides the National Transit Company there were a dozen or so other companies in 1892, but by 1901 two companies controlled practically all the pipe line in the United States, most of the mileage belonging to the National Transit Company, which previous to the dissolution in 1911 was an integral part of the Standard Oil Company (q.v.).

At river crossings the pipe is either carried on bridges or laid on and anchored to the bed of the stream. At the Hudson River crossing a trunk line laid prior to 1893 is anchored to two sets of heavy chains, parallel to and some 25 feet from the pipe, held down by heavy weights. This line is incased in a second pipe. Across the salt marshes near New York the line is incased in concrete, to prevent corrosion. Ordinarily an 8-inch trunk line costs from \$5000 to \$6000 a mile. It is always the raw not the refined oil that is pumped, and to prevent accumulations of dirt or paraffin it is necessary frequently to force a "go-devil" or scraper with sharp blades through the line. The Texas and California fields also have their systems of pipe lines. In fact, it has been estimated that there are over 10,000 miles of trunk line and 80,000 miles of feeders in the United States.

The oils in the western part of the United

States are heavier and more viscous than the petroleum of the Appalachian region, consequently great difficulty was experienced in forcing the oil through pipe lines. Accordingly, in 1907, a rifled pipe line was introduced in California for heavy oils, with a rifling about $\frac{1}{8}$ inch deep, making one complete revolution in 10 linear feet. This was employed on a line 282 miles in length for the dense petroleum in the Kern River district, the line extending between Bakersfield and Porta Costa, on San Francisco Bay.

In the United States the provisions of the amended Interstate Commerce Act, as in force on Jan. 1, 1916, "apply to any corporation or any person or persons engaged in the transportation of oil or other commodity, except water and except natural or artificial gas, by means of pipe lines and partly by railroad, or partly by pipe lines and partly by water." The Interstate Commerce Commission has prescribed certain rules and regulations for the classification of pipe-line accounts and for the destruction of records and early instituted an investigation into the practices of the pipe-line companies. The question of the jurisdiction of the commission was raised, and the Supreme Court of the United States sustained the conclusion of the commission in large part (*United States v. Ohio Oil Company et al.*, 234 U. S. 548). See RAILWAYS, section on *Government Regulation*.

The first oil pipe line was laid in Russia in 1879 to reach a refinery at the so-called Black Town of Baku. It was 8 or 9 miles long. By 1895 there were 22 pipe lines in Russia. In July, 1900, a pipe line 143 miles long, from Mikhoilovo to Batum, was put in use. It is for refined oil only, from the Baku deposits, supplementing the railway over a section where transportation is difficult. The line later was extended to Baku, making it 550 miles in length, with a designed capacity of 400,000,000 gallons per annum.

In Mexico the Furbero oil fields were connected by a 6-inch pipe line with Tuxpan on the seacoast, 60 to 70 miles distant. This pipe line extended about $1\frac{1}{2}$ miles out into the sea, so that tank vessels lying off the shallow shore could be filled while at anchor. In Mexico the Cowdray (British) interests have some 200 miles of pipe lines. Pipe lines are found in Galicia and Rumania, also in Japan, Burma, and the Dutch East Indies. At Panama before the opening of the canal an 8-inch pipe line 51 miles in length was maintained to transport oil from tank steamers on the Pacific to similar craft on the Atlantic.

Pumps are required on the pipe lines, since these climb hills and mountains many hundred feet high. The pumps are of the high-pressure, compound, condensed type, the later ones being high-duty. (See PUMPS AND PUMPING MACHINERY.) The head under which the pumps work may vary, of course, with the topography of the country through which the line is passing, but it is largely dependent on the friction alone in long lines of small pipe.

The pipe line has had a most important economic bearing on the oil industry. It has to a large degree eliminated local storage, has been able to accommodate local producers, who are for the most part independent, and made possible the concentration of refining at a few large centres convenient for export or distribu-

tion in barrels or tank cars. Thus, at one time, the Standard Oil Company maintained direct connection through feeders and main lines from individual wells to the refineries, and to-day it is possible for oil from the Oklahoma fields to be carried to the Atlantic coast. Pipe lines naturally were largely concerned in the development of the Standard Oil Company, and through the National Transit Company, Pacific Oil and Gas Company, and Buckeye Pipe Line it maintained a network serving the United States.

Natural-Gas Pipe Lines are often similar to the wrought-iron lines described above, but they are also composed of riveted steel plates and even of cast iron. Another variation from the oil pipe lines is the size of the gas mains, 16 to 24 inches or more in diameter instead of 4 to 8 inches. It is said that the Chinese used bamboo pipes for natural gas, and that a wooden main 20 miles long was laid from a well at West Bloomfield, N. Y., to Rochester as early as 1865 or thereabouts. In 1872 gas was piped to Titusville, Pa., through a 2-inch and a $3\frac{1}{4}$ -inch iron pipe line, $5\frac{1}{2}$ miles long. In 1876 a 6-inch main, 17 miles long, was laid to Sharpsburg, Pa., from the Harvey well, in Butler County. The feeders to the pipe lines are 2 to $2\frac{1}{2}$ inches in diameter. The main lines are 40 to 50 miles in length. The pressures in various fields originally ran from 300 to 1000 pounds per square inch, but they have fallen off, year by year, until in many cases where they have not failed they are only a small fraction of the initial. This has necessitated *pumping the gas*. The first pumps were installed by the People's Company, of Pittsburgh, Pa., in 1890. Now nearly every company supplying gas to the larger cities is compelled to pump in winter. The pumping is generally effected by some standard form of air compressor, driven by compound or triple expansion steam engines, or a booster or high-pressure blowers may be used where there is a pressure of 10 to 15 pounds and the market is reasonably near by. The gas itself is generally used as fuel, but sometimes coal is used in order to husband the diminishing gas supply. Large gas engines, even of 1000 horse power, are used to operate the gas compressors. The Midway Gas Company in California has a pipe line from Kern County to Los Angeles and the coast, 117 miles long, consisting of 12-inch pipe with plain end heads joined by the Hammond coupler. The initial pressure of 450 pounds to the square inch would afford a capacity of 24,000,000 cubic feet per day. A compressor plant is located in the district served by the Midway Company.

Where natural gas reaches a city or plant under high pressure, automatic pressure reducers are employed to reduce the gas to a uniform pressure of 10 to 50 pounds before it enters the distributing mains. On each consumer's service pipe another reducing and regulating valve maintains a pressure of about one-half pound. See GAS, NATURAL; PETROLEUM; PIPE; STANDARD OIL COMPANY.

Talbot, *The Oil Conquest* (London, 1914); *The Mineral Industry* (New York, annually); *Mineral Resources of the United States* (Washington, annually). For the problems involved in the flow of oil

in pipe lines, consult E. I. Dyer, "Notes on the Flow of Oil in Pipes," in *American Society of Mechanical Engineers' Journal*, vol. xxxvi (New York, 1914). For gas pipe lines: H. P. Westcott, *Handbook of Natural Gas* (Erie, 1913); *Classification of Investment in Pipe Lines, Pipe Line Operating Revenues, and Pipe Line Operating Expenses of Carriers by Pipe Lines*, prescribed by the Interstate Commerce Commission (Washington, 1914); *Regulations to Govern the Destruction of Records of Carriers by Pipe Lines*, prescribed by the Interstate Commerce Commission (ib., 1915).

PIPE OF DESIRE, THE. An opera by Frederick S. Converse (q.v.), first produced in New York, March 18, 1910.

PIPER. A fish of the North Atlantic coast, one of the gurnards (*Trigla lyra*), which reaches three or four pounds in weight and is delicate food. See GURNARD.

PIPER, MRS. LEONORA E. (?-). An American psychic medium. She early attracted the attention of Prof. William James and of other Americans, and in 1889-90 she gave sittings in England to Sir Oliver Lodge and other members of the Society for Psychical Research. Richard Hodgson and F. W. H. Myers believed in Mrs. Piper's ability to serve as a medium for communications from the dead, through speech or automatic writing. Others considered her powers telepathic. For details consult the long reports of Prof. James H. Hyslop, and Henry Holt, *On the Cosmic Relations* (2 vols., New York, 1914). See PSYCHICAL RESEARCH, SOCIETY FOR; SPIRITUALISM.

PIPERACEÆ (Neo-Lat. nom. pl., from Lat. *piper*, pepper), THE PEPPER FAMILY. A family of about 1000 species of dicotyledonous shrubs (a few almost trees) and herbs (some climbing), natives almost exclusively of the hottest parts of the globe, particularly of Asia and America. None of them are found in cold regions. Most of the species are called pepper, but some are known also by other names, particularly those of which the fruit is not used as a spice, but of which some part is otherwise employed, as betel, cubebs, matico, and ava. Pepper (q.v.) is the most important product of the family.

PIPERAZINE, known also as DIETHYLENE-DIAMINE, ETHYLENIMINE, PIPERAZINE, and DISPERMINE. A compound ($C_4H_{10}N_2$) formed by the action of ammonia upon ethylene bromide or chloride. It is produced also by the interaction of ethylene bromide and aniline upon the addition of a solution of potassium hydroxide, forming di-phenyl-piperazine. By treatment of this with sulphuric or nitric acid and distillation with alkalis piperazine is produced. It appears as white, odorless, tasteless, deliquescent crystals, which are freely soluble in water. Its use in gout and the uric acid diathesis depends upon its property of uniting with uric acid to form a very soluble compound which is excreted in the urine instead of forming calculi in the kidney. Its use in connection with these seems to be prophylactic, as its claims to a solvent effect upon concretions already formed have been exaggerated. It must be taken largely diluted with water.

PIPERIDINE, pi-pér'i-din or -dên. See ALKALOIDS; PIPERINE.

PIPERINE (from Lat. *piper*, pepper), $C_{17}H_{25}NO_6$. A weak basic substance found in pepper. It may be obtained by boiling powdered

pepper with slaked lime, filtering, evaporating the filtrate to dryness, and extracting the piperine from the residue with ether. When crystallized from alcohol, piperine forms colorless prisms, which are insoluble in cold water, but which dissolve readily in alcohol and ether. On heating piperine with caustic potash solution it breaks up into piperic acid, $C_{12}H_{15}O_6$, and a remarkable oily base called *piperidine* (C_4H_9N). (See PYRIDINE.) Piperine is used for making heliotropin and sometimes as a substitute for pepper. See ALKALOIDS.

PIPE ROLLS. A name applied to the great or annual rolls of the English Exchequer, written for the treasurer. They are so called because of their being rolled into the shape of pipes, or on account of the favorite comparison of the public treasury to a reservoir into which every branch of revenue flowed through these pipes. They were written by the treasurer's scribe and controlled by the Chancellor's scribe. They contained a statement of the King's revenue, drawn up by the sheriff of one or more shires, and an account of the expenditures made by the sheriff in his office. The chief item of the revenue was the "ferm" of the shire, which consisted of the King's income from the royal demesne, the yearly fines paid by the boroughs for their corporate privileges, and the fines decreed in the county courts. Another item was the Danegeld, tax levied to resist the Northmen.

The oldest extant pipe roll is that of 31 Henry I (1131). These rolls extend from the second year of Henry II (1156) till 1833, when the ancient system of the Exchequer was abolished, with but two breaks of a single year, and are among the most valuable of records preserved in the Public Record Office. In 1883 the Pipe Roll Society was founded, with the intention of publishing all the pipe rolls. Its publications (34 vols., London, 1884-1913) include the 5-24 Henry II, forming a combination with the publications of the Record Commission. The latter had in 1833 published the pipe roll of 31 Henry I and the Chancellor's roll of 3 John, and in 1844 the pipe rolls 2, 3, 4 Henry II and 1 Richard I. Consult Pipe Roll Society, *Publications* (London, 1884 et seq.).

PIPE/STONE. A city and the county seat of Pipestone Co., Minn., 198 miles west-southwest of Minneapolis, on the Great Northern, the Rock Island, the Chicago, Milwaukee, and St. Paul, and the Chicago and Northwestern railroads (Map: Minnesota, A 7). It is the principal commercial and shipping centre of the grain district of southwest Minnesota and has a large creamery and several wholesale houses. In this neighborhood was quarried the sacred pipestone of the Indians. In the city are a government training school for Indians and a Carnegie library. Pipestone was settled in 1878 and became a city in 1901. Pop., 1900, 2536; 1910, 2475.

PIPE VINE. See ARISTOLOCHIA.

PIPI, pè'pè (Brazilian name). The ripe pods of *Cesalpinia pappi*, used in tanning and not infrequently exported with divi-divi (q.v.). See CESALPINIA.

PIPING CROW, or CROW SHRIKE. One of the Australian shrikes of the genus *Gymnorhina*, large, black and white, insect-eating, showy birds, with loud, piping voices, mentioned in such local names as organ bird (*Gymnorhina hyperleuca*) of Tasmania and flute bird. The latter (*Gym-*

norhina tibicen) is very common throughout Australia. Compare ORGAN BIRD.

PIPISTRELLE, pip'is-trél'. See BAT.

PIPTT, or PIPIT LARK. See TITLARK.

PIPPA PASSES. A dramatic poem by Robert Browning (1841). Pippa, a girl from the silk mills at Asolo, on a holiday passes several groups of people at a critical moment in the lives of all, and by snatches of her song, which they overhear, changes the fate of each and in one case changes her own.

PIPPI, pip'pé, GIULIO, commonly called GIULIO ROMANO (1492-1546). An Italian painter, decorator, and architect, born in Rome. He was the chief follower of Raphael, whose school he entered early. Raphael, who left all his property to Giulio and Penni, another pupil, had chiefly relied on the former for the execution of his designs; Giulio assisted in the Stanza del Incendio, the Loggie of the Vatican, and in the Villa Farnesina. (See RAPHAEL.) He was also employed to paint easel pictures in Raphael's studio, especially such as were intended for foreign patrons, like the large Madonna in the Louvre and the so-called "Pearl" at Madrid. After Raphael's death he assisted in the Sala di Costantino in the Vatican, himself painting the chief composition, the battle picture; finished, together with Penni, the "Coronation of the Virgin," in the Vatican Gallery; and himself painted, in an admirable manner, the lower part of Raphael's "Transfiguration."

After Raphael's death Giulio was the acknowledged head of the school. Unfortunately his architectural works at Rome have been either spoiled by restoration or left incomplete, but we know that he designed and decorated for Cardinal Medici Villa Madama and Villa Lante. The best of his easel pictures are, perhaps, the "Madonna with the Cat," in the Naples Museum; "Apollo and the Muses," Pitti Palace (Florence); and the masterpiece of his early period, "The Stoning of St. Stephen," the altarpiece of Santo Stefano, Genoa. Other examples, both religious and mythological, are in Rome, the Uffizi (Florence), the galleries of Vienna, Dresden, the National Gallery (London), and especially in the Louvre, which is rich in his works. Compared with Raphael, his independent works show absence of religious feeling and lack of grace. The forms are often coarse, though the drawing is good, and the color is marred by the use of deep black shadows and a dull brick red. His work, on the whole, shows a greater influence of Michelangelo than of Raphael.

In 1524 Giulio went to Mantua at the call of Duke Federigo Gonzaga, who placed him at the head of all his artistic undertakings and raised him to the nobility. Here he developed a remarkable architectural activity, rebuilding whole quarters of the city. He built the ducal palace (1535-40), which was decorated after his designs, prominent among which were a series of frescoes of the Trojan War. Among his other architectural works were the great church of San Benedetto, 10 miles south of Mantua; the interior of the cathedral of Mantua; his own tasteful house (1544), built around a simple court and ornamented with a fine rustica façade; and the greatest of all his achievements, the Palazzo del Tè, just outside the city walls. Though enlarged from a stable for the Duke's stud, this palace is the best-preserved example of a princely villa of the golden age of Italian art. It is a one-story rustica building, in the Doric style.

The entire interior is decorated with stucco and frescoes, after Giulio's designs, by his pupils. The great hall has realistic portraits of the Duke's favorite horses, which are epoch-making in animal painting. Most beautiful of all the decorations are those of the second hall, representing the "Story of Psyche." Two of the original drawings for this cycle, preserved in the Villa Albani, are perhaps his most charming work. Of the remaining rooms the most famous is that in which the "Fall of the Giants" through Jupiter's thunderbolts is represented in a very realistic manner. The scenes are not divided by frames or paneling, and the spectator stands in the midst of the catastrophe, which is so realistically represented as to create the impression that the walls are falling in with the giants.

The chief characteristics of Giulio's Mantuan work are profound antiquarian knowledge and a pronounced tendency towards realism. The action is exaggerated and mannered, and in such frescoes as the "Fall of the Giants," which greatly influenced contemporary painters, it is already Barocco. Of his later religious works the most remarkable are the designs for frescoes in Sant' Andrea, Mantua, and for Torbido's paintings in the cathedral of Verona. Of his later easel paintings the "Adoration of the Kings," in the Louvre, and the "Madonna della Catina" (Dresden), in which the Christ child is naively represented as being bathed, were executed by his own hand. Pippi was also at the head of all the Duke's engineering undertakings, and in draining the marshes about Mantua he contracted a fever, from which he died at Mantua, Nov. 1, 1546, just as he was about to return to Rome to accept an appointment as architect in chief of St. Peter's. Consult C. K. D'Arco, *Istoria della vita et delle opere di Giulio Pippi* (Mantua, 1838), and A. Dollmayr, in *Jahrbuch der kunsthistorischen Sammlung des allerhochsten Kaiserhauses*, vol. xxii, part 1 (Vienna, 1901). See Plate of TAPESTRIES.

PIPPIN. See PEPIN.

PIPPUL, or PIPUL. See PEEPUL.

PIPPRA, pí'prá (Neo-Lat., from Gk. *πιπρά*, variant form for *πιπρῶ*, *pipró*, woodpecker, otherwise explained as of possible South American origin). One of a group of nonoscine, passerine birds composing the family Pipridae, many of which are also known as ant birds and as manakins (q.v.). They are chiefly South American, but a few species extend north into Central America and Mexico. They are small birds, resemble titmice in their habits, and seek their food in low bushes and near the ground. The males are gorgeously colored with glossy black, scarlet, yellow, and sky blue, the females are of a dull greenish hue, or of some other inconspicuous color. They are thickset birds, usually with short square tails and short broad bills, the upper mandible hooked and notched at the tip. The true manakins (*Manacus*) have the chin feathers elongated like a beard. Pippas are most nearly related to the cotingas and American flycatchers (q.v.). See Plate of COTINGAS.

PIPSISSEWA. A small evergreen plant. See WINTERGREEN.

PIQUA, plk'wá. A city in Miami Co., Ohio, 72 miles west-northwest of Columbus, on the Miami River and the Miami and Erie Canal and at the junction of the Cincinnati, Hamilton, and Dayton, the Pittsburgh, Cincinnati, Chicago, and St. Louis, and the Western Ohio railroads (Map: Ohio, B 5). It has the Schmidlapp Free School

Library, a Federal building, and the Ball Memorial Hospital. Piqua is an important industrial centre, with large sheet-steel mills, ironworks, stove and range works, strawboard mills, furniture factories, woolen mills, underwear mills, handle, pole, and shaft works, etc. Good water power is afforded by the river. Piqua is governed by a mayor, elected every two years, and a unicameral council, and owns and operates its waterworks. Pop., 1900, 12,172; 1910, 13,388; 1915 (U. S. est.), 14,029.

PIQUE DAME, pèk'dám'. An opera by Tschalkowsky (q.v.), first produced at St. Petersburg (Petrograd), Dec 19, 1890; in the United States, March 5, 1910 (New York).

PIQUET, pé'ká' (Fr., picket, peg). A game of cards, of great antiquity and considerable scientific possibilities. Its laws, as published in Hoyle's *Short Treatise on the Game of Piquet* in 1744, remained in force until the adoption of the rules of the Portland Club in 1873. It is played by two persons with a pack of 32 cards, the sixes, fives, fours, threes, and twos being discarded. In the cut for deal, the lowest takes the deal. Ace is highest and counts 11, the other cards ranking as in whist. After cutting, the dealer gives the two top cards to his adversary, then two to himself, and so on until each has 12 cards. If the hand of either player contains no face card it is called *carte blanche* (white card), and he scores 10 at once. The "elder hand" (the nondealer) must discard one of his cards and take another from stock, but he may discard as many as five and take a like quantity. The younger hand must discard one also and may discard three. The players then announce the combinations of their cards, and each replies according to whether he has, or has not, an equal or greater number, "good," "equal," or "not good," and scores "the point" according to the number of points the rules apportion to his combination. The play then proceeds, the leader of a counting card (ace, king, queen, knave, or ten) counting one for each card led, whether he wins the trick or not, and the winner of each trick leading for the next, as in most card games. The younger hand must, if possible, follow suit. If the leader wins the trick the opponent counts nothing, but if he wins the trick he counts one. The winner of the last trick counts two. If one player wins more than half the tricks he adds 10 to his count; if he wins all he adds 40. The variations of scoring and play for *carte blanche*, or a hand of only plain cards, *point*, the strongest suit, *sequence*, *quatorze*, *trio*, *pique* and *repique*, are too intricate to be described except by the laws of the game. Consult. Cady, *Piquet* (New York, 1896); "Cavendish," *The Laws of Piquet, with a Treatise on the Game* (London, 1882); "Aquarius," *Piquet and Crabbage* (ib., 1883).

PIRACICABA, pé'râ-sê-kâ'bâ. A town of the State of São Paulo, Brazil, on the left bank of the Piracicaba River, 273 miles west of Rio de Janeiro, and on Sorocabana Railway (Map Brazil, H 8). The town carries on a brisk trade in coffee and sugar and utilizes the water power of the river for milling purposes. Pop. (est.), 5000.

PIRACY (ML. *piratia*, from Lat. *piratica*, piracy, fem. sing. of *piraticus*, from Gk. *πειρατικός*, *peiratikos*, relating to a pirate, from Gk. *πειράτης*, *peiratēs*, pirate, one who attacks or tries, from *πειράω*, *peirao*, to attempt, attack, from *πειρα*, *peira*, attempt, attack; connected with *πόρος*, *poros*, passage, Skt. *par*, to cross,

and ultimately with Eng. *fare*). In the popular sense, the capture or destruction of a ship on the high seas by violence committed by persons not acting under national authority.

In Law. The crime of robbery on the high seas. In general, piracy is punishable by any member of the family of nations, whether the act was committed by or against its own subjects or citizens or not. The penalty is death. But piracy *jure gentium*, or piracy as defined by international law, and piracy as described by the municipal law of a particular state, must be distinguished.

International Law. Three requirements are necessary to constitute an act of piracy *jure gentium*: first, it must be an act of adequate violence, though it need not be necessarily an act of depredation. While the pirate is generally merely a robber, acts done by unauthorized persons for political ends have been deemed piratical, though the *animus furandi*, the intent to rob, was wanting. A single act of violence may be sufficient, as the successful revolt of a ship's crew against its officers. If they gain control of the ship, they are pirates; if their attempt fails and lawful authority is not in fact superseded, the act is one of mutiny only, not piracy. Second, it must be an act done outside the territorial jurisdiction of a civilized state. Some authorities have held that an invasion from the sea upon the coast of a civilized state to ravage and destroy without national authorization is piracy. But being done within the territorial jurisdiction of the state, it is subject to the municipal law thereof and is outside the jurisdiction of the international code. Yet an act of similar character against an unappropriated island and the robbing of civilized persons there engaged in trade or missionary work would be piracy. Third, the perpetrators of the act must be without the authority of any recognized political community. Acts which when done under national authorization are lawful acts of war are, hence, piracy when not so authorized, and the possession of two or more incompatible commissions is deemed to have the same effect as the absence of any. So if in time of war a privateer procures letters from each belligerent and preys upon the commerce of both, she is a pirate; but if a cruiser having a lawful commission exceeds her authority in making captures, she is not a pirate, for the state under whose authority she operates is held responsible for her acts. For this reason the acts of a cruiser or submarine in sinking enemy merchant ships with all on board or even in sinking neutral vessels, however repugnant such acts may be to international law or humanity, cannot properly be described as acts of piracy. Whether directly authorized or not by the state whose commission the attacking vessel bears, the acts are the acts of the state in question, and a civilized state cannot be guilty of piracy. For purposes of authorization recognition of independence is not required; but recognition of belligerency is sufficient to validate a commission authorizing acts of violence for belligerent cruisers; but if such a community ceases to exist as a political unit, the commission is no longer valid.

Attempts have been made to bring acts done by vessels under commissions from a revolted community, which has not obtained recognition of belligerency, under the protection of this rule. Several instances have occurred where a disposition has been shown to treat as pirates persons

accepting letters of marque and reprisal from one of two belligerents when the other was at peace with the nation of which the privateer was a subject, but such an attitude is at variance with the general usage of nations.

Municipal Law. One of the attributes of an independent state is the power to regulate its own criminal code, and it may declare offenses to be piracy which are not so regarded by international law. These laws can have binding force only in the jurisdiction creating them; and while similar regulations may be adopted by other states, in the absence of special agreement between them the officers of one may not arrest or punish subjects of the other for offenses committed beyond its jurisdiction, even though such acts are defined as offenses by the laws of the state to which the offender belongs. Thus, while the slave trade is declared to be piracy only by virtue of municipal law, efforts have been made to bring it under international jurisdiction by agreement between the Powers. This has not been effectually done, although after much international difficulty and dispute as to the right of search, etc., an international convention was finally reached in 1890 as a result of the conference of the civilized states, called at the instance of the King of Belgium, which provided for a complicated system of measures of repression.

See MARQUE, LETTERS OF; MUTINY; PRIVATEERING; SLAVERY. Consult the authorities referred to under INTERNATIONAL LAW.

PIRÆUS (Lat., from Gk. Πειραιεύς, *Peiraiæus*, Πειραιεύς, *Peiraiæus*). The port of Athens situated on a rocky peninsula about 5 miles southwest of the city (Map: Greece, E 6 and A 8). The nearest point in the shore line to Athens is the long sandy beach of Phalerum, bounded on the east by Cape Colias and on the west by a rocky peninsula, with two principal summits—one, Munychia, at the northeast, close to the bay of Phalerum; the other, Acte, at the southern end of the cape. In this promontory are three harbors. The smallest is on the east side of Munychia; the next in size is southwest of Munychia and northeast of Acte; the third and largest is on the west side of the peninsula, north of Acte, and is a large basin with two smaller bays at each side, almost landlocked between Acte and a tongue of land projecting from Eëtionea, on the Attic coast. This harbor is supplied with modern docks, and a portion of it is used by the Greek navy. Over one-half of the foreign commerce of Greece passes through Piræus, which is also a considerable manufacturing centre, producing mainly textiles, brandy, leather, paper, and macaroni. The population in 1909, according to Baedeker, was 74,580, making Piræus the second largest city of Greece. The earliest port of Athens was Phalerum, and the advantages of the Piræus were first observed by Themistocles (493-492), who began to fortify it. It was not till after the Persian wars that the peninsula was surrounded with lofty and strong walls, the mouths of the harbors narrowed by moles so that they could be easily closed by chains, and the whole connected with the city by the Long Walls (q.v.). The city was laid out by the famous architect Hippodamus of Miletus, probably in the time of Pericles, in a regular system of broad straight streets crossing one another at right angles and broken by frequent open squares. Wharves, warehouses, and porticoes were built along the harbor side, and a merchants' exchange was provided for the display of samples. The

great harbor was the scene of mercantile activity. The smaller harbors were reserved for the Athenian navy; the remains of the ship houses in which the triremes or war vessels were hauled up can still be traced. With the decline and ruin of Athens during the Middle Ages, the Piræus naturally was abandoned, and the present city has been built since Athens became the capital of Greece. According to the accepted nomenclature, the smallest harbor, now Fanari, is the ancient Munychia; the next, now Pashalimani, is Zea; the great harbor was known as Cantharus. Recently, however, strong reasons have been advanced for identifying Phalerum with Fanari, Munychia with Pashalimani, and Zea and Cantharus with the bays on either side of the great harbor.

Weller, *Athens and its Monuments* (New York, 1913).

PIRANESI, pē'rā-nā'zē, GIOVANNI BATTISTA (GIAMBATTISTA) (1720-78). An Italian architectural and decorative artist and engraver. His copperplate records of the monuments of ancient and contemporary Italy, remarkable for boldness of conception and brilliancy of execution, were a source book for the Louis XVI, Adam, and Empire styles. Piranesi was born at Mojano, near Venice, Oct. 4, 1720, the son of a stonemason. He first studied architecture with his uncle; a knowledge of perspective he gained from the writings of Vitruvius and under Carlo Zucchi. His brother Angelo, a Carthusian monk with an exhaustive knowledge of the classics, inspired him with enthusiasm for the ancient masterpieces. From 1740 to 1743, while at Rome as draftsman to the Venetian embassy, Piranesi studied architecture and antiquities and worked in the studio of the theatre decorators Giuseppe and Domenico Valeriani, taking up engraving towards the end of this period. Felice Polanzani, who was chiefly responsible for his training, was teacher of engraving at Rome in the Ospizio di S. Michele. In 1743 he published his first book, the *Prospettive* (13 plates). Returning from a visit to Venice, where it is said that he studied painting with Tiepolo (q.v.), Piranesi published four rococo *Grotesche* plates and the 14 famous *Carceri* plates, all of which show Venetian influence. In Rome he made a success of selling prints on commission, and before long he was able to undertake his task of illustrating the buildings of ancient and modern Rome in a monumental manner. An idea of the magnitude of his accomplishment may be gained from study of the huge engraved *Plan of Rome and the Campus Martius* (c.1774), with an index to all the buildings, and with reference to plates in *Antichità Romane*, *Vedute di Roma*, *Campus Martius*, *Magnificenza*. Especial interest attaches to the *Campus Martius* because its publication in 1762 was greatly encouraged by Piranesi's warm friend, the English architect and furniture designer, Robert Adam, to whom the volume is dedicated and who made free use of the prints in his own architectural work. Pira-

nesi was knighted by Pope Clement XIII. He died Nov. 9, 1778.

The total number of copperplates engraved by Piranesi, the majority folio or double-folio in size, is about 1000, exclusive of small text illustrations and vignettes. Most of these plates were published during his lifetime, between the years 1743 and 1778. After his death many plates by his son, Francesco Piranesi, and other engravers were added to the collection and appear in nearly all the approximately *Complete Editions of Piranesi*. Many of these additional plates were engraved and first published in Paris, after Francesco and his brother settled there in 1798. In 1835-39 was published the *Dido Edition of the Works of Piranesi*, the plates of which were acquired by the Royal Calcografia in Rome, excellent reprints still being made from many of them. Among the greatest of Piranesi's plates are his views of St. Peter's, exterior and interior, Column of Trajan, Fountain of Trevi, Golden House of Nero, Colosseum, Mausoleum of Hadrian (Castel Sant' Angelo), Arch of Titus, Pantheon, Lake Albano, Castel Gandolfo, and especially Pæstum. There are sets of his works in New York in the Public Library (2), the Avery Library of Columbia University, the libraries of the Metropolitan Museum of Art, and the Architectural League, and in several American private collections. A complete descriptive list of his plates and of the form in which they were originally published is given by Giesecke (revised by Hind and later by Hunter).

See INTERIOR DECORATION, *Adam Period*; PERCIER, CHARLES; FURNITURE.

PIRANO, pĕ-ră'nô. A seaport and episcopal city of the Crownland of Istria, Austria, on a peninsula in the Bay of Largone, 13 miles southwest of Trieste (Map: Austria, C 4). It contains an old castle, has a deep harbor and several dockyards, and is the seat of considerable commerce. Wine, oil, glass, soap, and chemical products are manufactured. The salt works of Pirano are among the most productive in Austria. Pop., 1910, 15,320, mostly Italians.

PIRATE, THE. A novel by Sir Walter Scott (1822).

PIRATE BUG. A bug of the family Reduviidæ, a large group comprising more than 2000 species, all of which are predatory in habits and feed upon other insects; also known as assassin bugs and cannibal bugs. With many species the beak is so strong that it is capable of piercing the skin of human beings. (See CONE-NOSE.) A notable example is the wheel bug (*Arilus cristatus*), called by the negroes in the South "The Devil's riding horse." The eggs, which look like miniature leather bottles standing on end and in hexagonal clusters, are attached to the bark of trees and hibernate. The young bug emerges by pushing off the cap of the bottle. It has a blood-red abdomen and in walking frequently elevates the hind end of the body, curling it forward. It feeds upon soft-bodied insects, such as plant lice, but, as it grows, attacks larger insects and when full grown will destroy big

caterpillars and even beetles. The full-grown bug is black and captures its prey by stealth. Its coloration is protective. In the more southern States it is an important factor in the destruction of numerous caterpillars which defoliate fruit and shade trees. Consult: V. L. Kellogg, *American Insects* (New York, 1908); J. H. Comstock, *Manual for the Study of Insects* (8th ed., Ithaca, 1909); L. O. Howard, *Insect Book* (New York, 1914).

PIRATE PERCH (so called from its voracity). A strange little fish of sluggish streams along the eastern coast of the United States and in the Mississippi valley, which is related to the perches, but has been set apart in a suborder,

PIRATE PERCH.

Xenarchi. The single species (*Aphredoderus sayanus*) represents the only genus and family of this group, which appears to be a relic of an ancient type. Its color is dark olive, profusely speckled with darker points, which often make blackish streaks along the rows of the scales; two blackish bars cross the base of the tail; and the length is about 5 inches.

PIRATES OF PENZANCE, THE. A comic opera, words by Sir William S. Gilbert and music by Sir Arthur Sullivan (q.v.), first produced in New York, Dec. 31, 1879; in England, April 3, 1880 (London).

PIRAYA, pĕ-ră'yă, or **PIRAI**, pĕ-rĭ'. A South American fish. See CARIBE.

PIRENE, pĭ-rĕ'nĕ. A spring at Corinth, sacred to the Muses. Various accounts are given of its origin, but the usual tradition declares that it was struck out of the Acrocorinthus by the winged horse Pegasus, who was captured by Bellerophon while drinking its waters.

PIRENEOS, LOS, lōs pĕ'ră-nă'ōs (Sp., The Pyrenees). An operatic trilogy by Pedrell (q.v.). Its first performance was at Barcelona, Jan. 4, 1902.

PIRITHOUS, pĭ-rĭth'ô-ŭs. In Greek legend, King of the Lapithæ (q.v.) and son of Ixion, or of Zeus. At his marriage with Hippodamia the centaur Eurytus carried off the bride. In the fight that resulted between the Lapithæ and the Centaurs, Pirithous was aided by his friend Theseus (q.v.), King of Athens, and subsequently, with his help, attempted to carry off Persephone (see PLUTO) from the lower world. For this both were bound to a rock by Pluto, but Theseus was released by Hercules, while Pirithous was left to his punishment. Consult Horace, *Odes*, iii, 4, 80; iv, 7, 27-28.

PIRKHEIMER, pĭrk'hĭ-mĕr, WILFALD (1470-1530). A German humanist. He was born at Eichstätt, was educated at Padua and Pavia, and after settling in Nuremberg (1497) was counselor to the Emperor Maximilian for many years. He did much for the schools of Nuremberg. In 1526 he became counselor to Charles V, but soon gave himself up entirely to scholarly studies. At the beginning of the

Reformation Pirkheimer aided with Reuchlin and finally took much the same position as Erasmus, with whom, as well as with Reuchlin, Celtes, Hutten, and especially Dürer, he was on intimate terms. He wrote on mathematics, astrology, theology, and politics; also *Historia belli Sutsensis*, dealing with the war in Switzerland in 1499, in which he had commanded the forces of Nuremberg (edited, with an autobiography, by Rück, Munich, 1895), and various translations from Greek into Latin. Consult: Hagen, *Wilibald Pirkheimer in seinem Verhältnis zum Humanismus und zur Reformation* (Nuremberg, 1882); Otto Markwart, *W. Pirkheimer als Geschichtsschreiber* (Zurich, 1886); F. Roth, *Wilibald Pirkheimer* (Halle, 1887).

PIRMASENS, pîr'mâ-zên's'. A town in the Rhine Palatinate, Bavaria, situated about 30 miles southwest of Speyer (Map: Germany, B 4). It has a Protestant church with a fine monument to Landgrave Louis IX of Hesse. Its chief industry is the manufacturing of footwear, which is carried on on a large scale. Pirmasens is noted as the scene of a victory of the Prussians over the French, under Moreau, in 1793. Pop., 1900, 30,194; 1910, 38,463, chiefly Protestants.

PIRNA, pîr'nâ. A town in the Kingdom of Saxony, Germany, situated on the left bank of the Elbe, about 11 miles by rail southeast of Dresden (Map: Germany, E 3). It has a number of churches dating from the thirteenth century, an old castle with an insane asylum, a Realschule, a seminary for teachers, a school of navigation, and a municipal museum. The manufactures include leather, essential oils, enameled ware, pottery, various kinds of glass, etc. Pirna is first mentioned as a possession of the bishops of Meissen in the tenth century. It attained considerable prosperity in the Middle Ages, but subsequently declined on account of the ravages of war. During the Seven Years' War the Saxons intrenched themselves in Pirna and were forced to capitulate to a superior force of Prussians on Oct. 17, 1756. Pop., 1900, 18,295; 1910, 21,035.

PIRO, pî'rô. The name of two Indian tribes—one of North America, the other of the southern continent. 1. Piro, a Pueblo tribe of Taínoan stock, formerly occupying several villages on the plateau east of Albuquerque and along the Rio Grande near Socorro. Their most famous village was Tabira, confused by the Spaniards with the mythical Gran Quivira. Most of the villages were destroyed by the Apaches before 1680. The tribe is now extinct, excepting a nearly Mexicanized remnant at Senecu, Mexico. 2. Piro, Chuntaquiru, or Simirinche, a southern tribe of Arawakan stock (q.v.) occupying the headwaters of the Apurimac and Ucayali rivers, Central Peru. They were in part converted by the Jesuits between 1683 and 1727. They get the name of Chuntaquiru (palm tooth) from their custom of dyeing their teeth black with the root of the chunta palm. They are expert boatmen and fishermen and collect sarsaparilla and make manati oil for the traders. They dress in black cotton cloth.

PIROGUE, pî-rôg', or **PERIAGUA**, pîr-i-âg'wâ. (Fr. *progue*, from Sp. *piragua*, canoe, from the West Indian name). A form of boat used on the Western rivers of the United States and in the West Indies and Central and South America. It is usually a dugout and is made from a single log. But larger varieties are made from dugouts by splitting them in two and inserting one or more planks in the bottom to give greater

width. When fitted with sails these boats usually have two masts, which may be easily unstepped and taken down.

PIRON, pî-rôn', ALEXIS (1689-1773). A French poet and dramatist, famed for wit and epigram. He was born in Dijon, studied law, and in 1719 went to Paris as secretary to Belle-Isle, grandson of Fouquet. With Piron's monologue in three acts, called *Arlequin Deuotion*, the comic opera acquired new life. *La métromanie* (1738) also has some dramatic merit. Piron's Works are in seven volumes (1776). The epigrams, often reprinted, possess the greater significance. Piron died in Paris.

PIROT, pî-rôt'. A town of Serbia, situated near the Bulgarian frontier on the railroad from Belgrade to Sofia and 48 miles northwest of the latter city (Map: Balkan Peninsula, D 3). It is a fortified place of considerable strategic importance, and is noted for the manufacture of carpets. Pop., 1911, 10,737. In the great war which broke out in 1914, Pirot was captured by the Teutonic allies. See WAR IN EUROPE.

PIRQUET, pîr'ká, CLEMENS, BARON VON (1874-). An Austrian pediatricist. Born at Hirschstetten, near Vienna, he graduated M.D. from the University of Graz in 1900. Joining the faculty of the University of Vienna as lecturer in 1902, he was later professor of pediatrics at Johns Hopkins, at Breslau, and from 1911 at Vienna. Von Pirquet discovered the diagnostic value of tuberculin as a cutaneous reaction (1907). His writings include: *Die Serumkrankheit* (1905), with B. Schick; *Allergie* (1910); *Das Bild der Masern auf der äusseren Haut* (1913). To Nothnagel's *Spezielle Pathologie und Therapie* (1911) he contributed the article "Masern."

PIRRIE, pîr'î, WILLIAM JAMES, first BARON (1847-). An Irish shipbuilder, born in Quebec of Scotch-Irish parents. At Glasgow he studied for a time in the Royal Academical Institution. When he was 15 he became a draftsman apprentice in the (then small) shipyard of Harland and Wolff at Belfast. In 1874, when he was only 27, he was offered a partnership in this concern, of which he later became chairman. The firm built many of the larger British liners, from the *Teutonic* (1889) and *Oceanic* (1899) to the *Olympic* and *Titanic* in 1910. Pirrie was Lord Mayor of Belfast in 1896 and 1897 and high sheriff of County Antrim in 1898 and of County Down in 1899. In 1904 he left the Unionist for the Liberal party. Two years later he received a barony, in 1907 the post of controller of the Lord Lieutenant's household, and in 1909 membership in the Order of St. Patrick. He had become a prominent advocate of Home Rule. In 1910 he was appointed a member of the Road Board created under the Development and Road Improvement Act of 1909.

PISA, pî'zâ. The capital of the Province of Pisa in Tuscany, Italy, situated on both banks of the Arno, 6 miles from the Mediterranean, 11 miles northeast of Leghorn, and 49 miles west of Florence (Map: Italy, C 3). The climate is equable. The neighboring mountains (the Monti Pisani, 5 miles to the east) and the high ancient fortifications (over 6 miles in circuit) protect the city from winds.

The city is defended by a citadel on the southwest. Its streets are quite regular and are well paved. The centre of life in Pisa, which is a quiet town, is the Lungarno—stretches of fine wide quays bordering both banks of the river

PISA

THE CAMPANILE (LEANING TOWER) AND CATHEDRAL (EAST END)

THE BAPTISTERY

from one end of the municipality to the other. Here are fine hotels and restaurants. The Arno is spanned by five bridges.

The glory of Pisa is the far-famed Piazza del Duomo with its cathedral, baptistery, leaning tower, and Campo Santo, all situated in the extreme northwest corner of the city. The splendid cathedral, or basilica, was built after plans of Rinaldo and Boschetto between 1063 and 1118 and the ceiling and dome were restored in 1597-1604, after a fire. It is a remarkably perfect example of the Tuscan-Romanesque. It is of white marble, varied with black and red stripes. It is crowned by an elliptical dome over the crossing. Over the apse is a semidome which contains mosaics on gold ground by Cimabue and others. The façade, with its four ranges of superposed arcades and its three noble portals, rivals any in Italy. Many singular irregularities in the lines of this edifice have given rise to much controversy. The researches of Good-year have led to an increasing conviction that these were intentional deviations and not accidental. (See *REFINEMENTS OF ARCHITECTURE*.) In the interior are 68 antique columns taken by the Pisans in their wars with their enemies. Among the interesting contents is a handsome bronze lamp suspended in the nave, the swaying of which is said to have suggested to Galileo the isochronism of the pendulum. The circular marble baptistery (1153-1278), adorned with numerous columns, stands in front of the cathedral. Its dome rises to a height of nearly 200 feet, and possesses a remarkable echo. The baptistery contains a madonna by Giovanni Pisano, and a pulpit, a celebrated masterpiece, by Nicola Pisano. The beautiful marble campanile, or leaning tower (qv), rises in the rear of the church. The view from the top, reached by nearly 300 steps, is superb, embracing the Carrara and Apuan mountains, the city, and the blue sea.

Northwest of the cathedral is the quadrangular Campo Santo (cemetery). It was laid out in the beginning of the twelfth century. Its soil was brought in ships from Mount Calvary, that the dead here might lie in truly consecrated ground. A decorative Tuscan-Gothic structure (1278-83), planned by Giovanni Pisano, incloses the cemetery. Within it are interesting and suggestive frescoes by late mediæval Tuscan artists. Of these paintings the most remarkable is the "Triumph of Death." There is also a notable "Last Judgment." The monuments, sarcophagi, tablets, etc., in the cemetery proper are of exceptional interest. The Basilica San Paolo a Ripa d'Arno, founded by Charlemagne, but belonging in its present form probably to the thirteenth century, possesses a rich façade of yellow, gray, and black marble. Santa Maria della Spina (founded 1230, restored 1872) is a beautiful little church in the Italian Gothic style. There are several other interesting Gothic and Renaissance churches.

Among the palaces the attractive brick Gothic Agostini of the fifteenth century deserves mention, as does also the Toscanelli, where Lord Byron sojourned in 1822. In the Loggia de' Banchi is the present corn exchange. Near by is the Palazzo del Comune, containing the valuable Pisan archives. The university, founded in 1338, is in a huge building dating from the latter part of the fifteenth century. (See *PISA, UNIVERSITY OF*.) The municipal museum (founded in 1893) contains works by Tuscan

masters, but nothing of great interest. The Palazzo Conventuale dei Cavalieri is at present a high normal school. The Academy of Fine Arts was founded by Napoleon in 1812. Pisa has statues of the Grand Duke Leopold I, Garibaldi, Mazzini, and Grand Duke Cosimo I, by Giovanni da Bologna, near which last once stood the historic Tower of Hunger of horrible memory, described by Dante in the *Inferno*. (See *GHERARDESCA*.) The house where Galileo was born is shown.

Pisa is wealthy and in a thriving condition. Cottons are largely manufactured. Oil and marble from the vicinity constitute important shipments. The city was formerly a port on the sea, but the silting up of the Arno caused Leghorn to grow in importance. There are fine market halls, an extensive hospital, and four theatres. The rich gardened plain around Pisa, lined with poplars, is interesting despite its flatness. Pop., 1901, 28,046; commune, 61,321; commune, 1911, 65,232; 1914, 66,432.

The city was probably of Etruscan origin. It fell to Rome in 180 B.C. The Romans embellished it and made it important. About 1000 A.D. it became a formidable commercial and naval rival of Venice and Genoa. It played a prominent rôle in the defense and diffusion of Christianity. Its warring citizens took Sardinia from the Saracens and finally destroyed their naval power in the Mediterranean. Corsica and the Balearic Islands fell to them. The city was in the full flower of its greatness in the twelfth and thirteenth centuries, when it took a prominent part in the Crusades. It held the coast from near Genoa to the vicinity of Rome. It had many contests with Lucca and Florence, as it was aggressively Ghibelline. The fall of the Hohenstaufens was a blow to the city, and it met decisive defeat by Genoa in a great sea fight off Meloria, near Leghorn, in 1284. A few years later the Genoese destroyed its harbor. It began to decline, gradually losing all its possessions, and in 1406 fell under the sway of Florence. It shook off the Florentine yoke in 1494, only to be resubjected in 1509. Henceforth its history was part of that of the Florentine state and of Tuscany. In 1551 Pisa had only about 8500 inhabitants. In the height of its prosperity, in the twelfth century, it is said to have had no less than 150,000.

In art history Pisa earned a worthy name until supplanted by Florence. Its cathedral marks the beginning of Italian art of the Middle Ages. The only branch of art, however, in which Pisa left an important influence was architecture (particularly ecclesiastical architecture), though it gave no little impetus to sculpture, being the native city of Nicola Pisano and his son Giovanni. Consult: I. B. Supino, *Il Camposanto di Pisa* (Florence, 1896); Ross and Erichsen, *Story of Pisa*, in "Mediæval Towns Series" (London, 1909); Thomas Gsell Fels, *Oberitalien und Mittelitalien* (9th ed., Leipzig, 1912); Karl Baedeker, *Northern Italy* (14th ed., ib., 1913).

PISA, COUNCIL OF. A council held in the year 1409, not reckoned among the ecumenical councils. It was assembled in the time of the great schism which followed the removal of the popes to Avignon (see *PAPACY*; *SCHISM, WESTERN*), for the purpose of restoring the peace of the Church. The cardinals of both parties, desiring to put an end to the anomalous condition which existed, united to call a general council. Both claimants to the papacy, Gregory XII and

Benedict XIII (antipope), were notified by their adherents and requested to appear at its sessions. Both, however, refused and called synods of their own. The cardinals persisted and proceeded to deliberate upon the case. Twenty-two of them were present, besides some 80 bishops and representatives of over 100 more, with a vast body of abbots, doctors, and other eminent ecclesiastics. After a formal citation of the rival popes the council, on their nonappearance, proceeded to declare them contumacious and to examine their respective claims as though they had appeared. The result, after a protracted inquiry, was a decree by which they were both declared schismatics and deposed from the papal dignity and their followers released from obedience. In the seventeenth session the cardinals entered into conclave to the number of 24 and on June 26 unanimously elected Peter Philargi, who took the name of Alexander V. The council proceeded after his election to pass a number of decrees, for the purpose of giving validity to the acts done on either side during the schism. A vain attempt was made to obtain the submission of the still recusant rivals, and it was resolved that a new council should be held within three years. The authority of this council, like that of the Council of Constance, is alleged by some Gallican divines to establish the superiority of a general council over the Pope. But the contention is made in reply that both these councils, and also that of Basel, must be regarded as abnormal assemblies, called to meet the special emergency of a disputed succession and of a doubtful pope, and that these principles cannot by any means be applied to the ordinary circumstances of the Church, or form a precedent by which to estimate the normal relations between a pope whose title is certain and undisputed and a general council regularly assembled in the ordinary circumstances of the Church.

There were two other councils at Pisa—in 1133, when Peter of Bruys was condemned, and in 1511, when certain cardinals endeavored to have Pope Julius II condemned for not calling a general council to reform the Church. Consult: K. J. von Hefele, *Conciliengeschichte*, vol. vi (Freiburg, 1890); F. Stühr, *Die Organisation und Geschäftsordnung des Pisaner Konzils* (Schwerin, 1891); Mandell Creighton, *History of the Papacy from the Great Schism to the Sack of Rome*, vol. iii (London, 1903); Ludwig Pastor, *History of the Popes from the Close of the Middle Ages*, vol. i (3d ed., ib., 1906).

PISA, UNIVERSITY OF. One of the oldest European universities. Teachers of law and medicine were known at Pisa as early as the twelfth century, but the real beginning of the university dates from the emigration of a large number of students and teachers from Bologna in 1338 on account of the interdict of Pope Benedict XII. At the instance of the Pisans Pope Clement VI authorized the establishment of a *studium generale*, which was dissolved in 1359 for lack of funds. In 1634 a new authorization was obtained from Pope Urban V for its reestablishment. With the loss of Pisan independence in 1406 the university ceased to exist, but it was opened again by Lorenzo de' Medici and flourished for a while. It soon went out of existence again. Cosimo I de' Medici reopened it in 1543 and supported it generously. In 1544 a botanical institute, the first of its kind, was established and the university soon achieved considerable fame. With the decay of Italian uni-

versities it suffered the general fate. It was revived in 1808 by Grand Duke Leopold II of Tuscany, who endowed it munificently. In 1839 it received a well-equipped physical institute. After the revolution of 1848 it was reduced to a mere natural science and mathematics section, but was reopened with all faculties in 1850 and has since maintained a high standing among Italian universities. In 1913 it consisted of the faculties of law, medicine-surgery, philosophy, and mathematics-natural science, and the engineering, pharmacy, veterinary, and higher agricultural schools. The attendance in 1913-14 was 993, and the library contained 202,976 volumes, 97,302 pamphlets, and 814 manuscripts.

PISACA, pē-shā'chā. The name of the most malignant demons in Hindu mythology. In the Vedas they are opposed especially to the pitris (see PITRĪ), and are frequently termed *kravyādas*, or eaters of raw flesh. They infest houses and villages, and as Agni (q.v.) is besought to restore the flesh which the pisacas have devoured from the sick man, they seem to have been ghoulish in nature and associated with ghosts of the malignant dead. In modern India the pisaca is preëminently the spirit of a liar, adulterer, criminal, or lunatic. The legendary accounts of the origin of the pisacas vary. According to the earlier view, they, together with the asuras and rakshasas, were created by Brahma from the stray water which was scattered from the drops out of which gods, men, and other good beings had been formed. Other sources, however, regard them as the offspring of the Prajapatis or of Prajapati (q.v.) himself. Consult A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897), and W. J. Wilkins, *Hindu Mythology* (London, 1900).

PISACA, or PAISACI, LANGUAGES. A group of very archaic dialects, recalling the Vedic in many points, spoken chiefly in the highlands of northwestern India (Laghman, Kafirstan, Chitral, Gilgit, Kashmir, etc.). They form the basis of Kashmiri, in which, however, they are submerged by an influx of other Indo-Aryan elements. They are generally classified as belonging to the Iranian group of the Aryan languages of India as distinguished from the Indo-Aryan group. Among their nearest relatives are the Pashto, or Pushtu, which is the common language of Afghanistan (q.v.), and Baluch, spoken in Baluchistan. According to Grierson, the Paisaci languages are neither of Indian nor of Iranian origin. He maintains that they form a third branch of the Aryan family, which were separated from the parent stem after the branching forth of the original of the Indian languages, but before the Iranian languages had developed their typical characteristics. The Paisacis were hardy northerners who settled in the country inhabited by the ancestors of the speakers of Burushaski, but whether they entered India in the first or the second series of invasions or at some later time cannot be ascertained. There are also traces of these half-barbarous tribes existing in ancient times in Sind and Western Punjab. Consult G. A. Grierson, *The Pisāca Languages of North-Western India* (London, 1906).

PISAGUA, pē-sā'gwā. A town of the Province of Tarapacá, Chile, on the Pacific coast, 46 miles north of Iquique, with which it is connected by rail (Map: Chile, C 7). It is the second city of the province, situated in a desert country, with a fair harbor, well-constructed

streets, and modern houses. The great industry of the town is the shipping of nitrate, which is brought by rail from the interior. In 1911 imports amounted to \$709,327 and exports \$5,311,605. Pop., 1907, 4089. In 1868 and again in 1877 the town was nearly destroyed by earthquakes. On April 18, 1879, in the war of Chile against Bolivia and Peru, it was bombarded and completely destroyed by the Chilean fleet, but after the cessation of hostilities was quickly rebuilt. Near the town (Nov. 19, 1879) occurred a battle in which 6000 Chileans defeated the combined forces of Peru and Bolivia, numbering 11,000.

PISAN, pē-zān', CHRISTINE DE. See CHRISTINE DE PISAN.

PISAN'DER, or **PEISANDER** (Lat., from Gk. Πεισανδρος, *Peisandros*). A Greek poet. He was born at Camirus, or Camirus, in the island of Rhodes, and appears to have lived about 650 B.C., although some critics state that he was earlier than Hesiod and was a contemporary of Eumolpus. He is remembered chiefly for his *Ἡράκλεια*, a poem in two books on the exploits of Hercules (q.v.), only a few lines of which have been preserved. See CANON ALEXANDRINUS. Consult Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i, part i (6th ed., Munich, 1912).

PISANDER, or **PEISANDER**. An Athenian politician, of the deme (q.v.) of Acharnæ, one of the leaders of the oligarchical party during the Peloponnesian War. (See GREECE, *Ancient History*.) He was prominent in the prosecutions that followed the mutilation of the Hermæ in 415 B.C. (See ALCIBIADES; ANDOCIDES; ANTIPHON; HERM.) In 412 he was one of the commanders of the Athenian fleet. In 411 he helped to establish the council of the Four Hundred at Athens; after the overthrow of the council he fled to Sparta. Consult Plutarch, *Alcibiades*; Thucydides, vi, 27, 60; vii, 49, 63, 89.

PISANELLO, pē-zā-nēl'lo, properly VITTORE PISANO (c.1385-1455). A Veronese painter and the greatest medalist of the early Renaissance. His art shows the influence of Altichiero of Verona and that of Gentile da Fabriano. About 1409-14 he assisted the latter in decorating the ducal palace in Venice and in 1431 and 1432 there is record of his painting frescoes in the Lateran, Rome. After painting other important work of this kind in Florence, he was active from 1438 to 1448 in various places, chiefly in the service of the Este family, of whom he modeled medals and painted portraits. In 1441, in competition with Jacopo Bellini, he painted the portrait of Leonello d'Este now lost, but a vigorous version of this subject by him survives in the Gallery of Bergamo. In 1448 he went to Naples in the service of King Alfonso.

In his own day Pisanello was most celebrated as a fresco and portrait painter. Of his important frescoes all have perished except an early "Annunciation" in San Fermo, Verona, and "St. George and the Princess," Sant'Anastasia, Verona. He delighted in details and had a remarkable talent for the drawing of animals, which he introduced on every occasion.

But it is chiefly as a medalist that Pisanello was most original and important. The medal gave opportunity for his clear-cut drawing, his ability as a portraitist, and fine characterization, and he was the first to raise this kind of work to the dignity of an independent art. His

splendid series of medals of his patrons, beginning with Joan Palæologus, include those of Francesco Sforza, Leonello d'Este, Sigismondo Malatesta (all in the British Museum), Vittorino da Feltre (Berlin), and the different medals of Alfonso of Naples (British Museum). His surviving drawings are numerous and effective. Consult: Jean de Foville (Paris, n. d.); Spaventi (Verona, 1893); Giorgio Vasari, *Lives of the Painters*, vol. i, edited by Blashfield and Hopkins (New York, 1896); and G. F. Hill, *Pisanello* (ib., 1905); also the articles by A. Venturi in various art periodicals.

PISANI, pē-zā'nē. A family of Italian sculptors named from their residence at Pisa. They were the principal artists of the Pisan school, the most important preceding the Renaissance, and are treated under three headings: PISANO, ANDREA, GIOVANNI, and NICOLA.

PISANI, VETTOR (?-1380). A Venetian admiral, son of Admiral Nicolo Pisani. After the renewal of war between Venice and Genoa in 1378, Pisani, as commander in chief of the Venetian naval forces, met and defeated the Genoese fleet off Capo d'Anzio and captured the Genoese admiral (Fieschi). He later recaptured the Dalmatian ports which had been seized by the Hungarian allies of Genoa and for a year sought the other Genoese fleet commanded by Admiral Luciano Doria. When he reached Pola, on his return for repairs, the Genoese fleet appeared. Forced by the civil commissioners to attack a force double his own, Pisani was defeated and upon his return home was sentenced to six months' imprisonment. The Genoese fleet continuing its advance on Venice, Pisani was released and given supreme command afloat and ashore. Eventually he captured the Genoese fleet and military forces—a victory which established the maritime supremacy of Venice.

PISANO, pē-zā'nō, ANDREA (c.1270-1348). One of the principal Italian sculptors of the Middle Ages, a master of the Pisan school. He was the son of Ugolino di Nino, a notary of Pontedera, where probably he was born, and he received his artistic education in the neighboring Pisa, whence his name. When in 1330 a sculptor was sent for to model two doors of the baptistery of the cathedral of Florence, he was chosen as the chief master of Pisa. Before this he had worked principally as a goldsmith. The wax models of the 28 reliefs of the bronze doors were completed within the marvelously short period of three months, but the casting was delayed, and finally was completed by Andrea himself. The gilded portals were dedicated amid great public festivities in 1336. The subjects are 20 scenes from the Life of John the Baptist and eight "Christian Virtues." In contrast to the work of Giovanni Pisano, Andrea's panels are distinguished by paucity of figures, by dignified, reposeful action, and admirable composition. On the death of Giotto in 1336 Andrea succeeded him as the head master of the works of the cathedral. As such he was in charge of the building of the campanile. Andrea probably left Florence in 1343 when the Duke of Athens, who employed him, was expelled. In 1347 he was head master of the cathedral of Orvieto, in charge of building the façade, and he died the following year. While at Florence he founded a school, his chief pupils being Andrea Orcagna and Balduccio da Pisa. Consult the bibliography of PISANO, NICOLA.

PISANO, GIOVANNI (c.1245–after 1314). The most important sculptor of mediæval Italy. The son of Nicola Pisano, he was born at Pisa, where he was his father's apprentice. In 1265 and again in 1267 he is mentioned as his father's assistant in contracts for the pulpit of Siena, in which Giovanni's influence may probably be seen in the crowded composition and dramatic quality of the reliefs. Another early work is the holy-water font of San Giovanni Fuorcivita. For the execution of the fountain of Perugia (1274–78), after Nicola's design, Giovanni was chiefly responsible. In 1277–83 the latter designed and superintended the construction of the Campo Santo of Pisa, the most beautiful in Italy, the arcades of which are masterpieces of round-arched Gothic. This was done in his capacity of *capo maestro* (architect in charge) of the cathedral of Pisa, to which office he was formally appointed in 1278. He was at the same time in charge of the decorations of the baptistery. From 1284 to 1299 he was *capo maestro* of Siena Cathedral. The corner stone of the great façade, after his design, was laid in 1284. The design may still survive in the two lower stories. Certain powerful statues of sages, prophets, and sibyls on the façade and fragments of statues in the cathedral museum are in all probability his work. During the following years he lived chiefly at Siena, becoming a citizen of the town, in which he possessed a house and land and a burial vault near the cathedral. In 1301 he completed the pulpit of Sant' Andrea Pistoja, the most characteristic of his larger works. Decorated with reliefs from the life of Christ and with figures of the prophets and sibyls, it is the culmination of his art. The reliefs are of highest dramatic vigor, and in the statue of one of the sibyls he approaches the majesty and power of Michelangelo. During the first decade of the fourteenth century he was again *capo maestro* at Pisa and in this capacity undertook his most ambitious work of sculpture, the large pulpit of the cathedral. Unfortunately its parts have been dispersed, some of them being utilized in the present pulpit, while others are in the museums of Pisa and Berlin. An important and original work, of which only inconsiderable fragments survive, was the tomb of Queen Margaret, wife of Henry VII, in San Francesco Castelletto (c.1312). In 1314 Giovanni was again in Siena and there he probably remained as *capo maestro* until his death. He is last mentioned in a document of 1314. Besides the works enumerated above he carved many madonnas, powerful yet freely posed and of fine expression. The earliest known is the Madonna of the Campo Santo (1277–84); others are the Madonna with the Two Johns, over the baptistery portal (1295); an ivory statue in the sacristy of Pisa Cathedral; a marble statue in the Arena Chapel at Padua; and the celebrated Madonna della Cintola (of the girdle) in Prato Cathedral (c.1320). Giovanni was an epoch-making figure in Italian art, not only in sculpture, where he introduced a new manner which dominated the century, but, hardly less, in painting, where his influence is reflected by Giotto and certain Sienese masters. Unlike Nicola, who found inspiration in the antique, Giovanni sought it only in nature. He accepted without reserve the spirit as well as the forms of the incoming Gothic art. Whether he learned from the French, from the Germans, or from the Cistercians at San Gal-

gano, near Siena, is a much disputed question which can hardly be decided. His figures are slender, with the familiar Gothic pose; the composition tends to be overcrowded, the action highly dramatic, sometimes exaggerated. But his art always charms by reason of its sincerity, its profound religious feeling, striving after expression rather than after classic beauty. For bibliography, see PISANO, NICOLA.

PISANO, GIUNTA. An early Italian painter. See GIUNTA PISANO.

PISANO, LEONARDO. See FIBONACCI, LEONARDO.

PISANO, NICOLA (c.1210–20–1278–87). An Italian sculptor, the first great precursor of the Renaissance; also reputed an architect. His birthplace is a matter of dispute, some maintaining that he was a native of Apulia, whence he brought an art formed upon classical models. It seems more likely, however, that he was born in one of the two Tuscan towns called Puglia. Nicola's study of the antique, especially of Roman sarcophagi, led him to treat the nude, to aim at rich effects of drapery and at artistic grouping of figures. His earliest known work is a lunette in the cathedral of Lucca representing a "Deposition from the Cross," the "Nativity of Christ," and the "Adoration of the Magi" (c.1237). His masterpiece is the famous six-sided marble pulpit of the baptistery at Pisa, finished in 1260. The body of the pulpit, decorated with five reliefs, rests on Corinthian columns. Between the reliefs are charming statuettes and the columns rest on lions. In one of the reliefs a figure of the high priest seems copied from an Indian Bacchus of an antique vase, while in others there are figures from a Roman sarcophagus, both still in the Pisan Campo Santo. Among the bas-reliefs of the pulpit, which represent scenes from the life of Christ, those of the "Nativity" and "Adoration" are the finest. Nicola's style appears at its best in these broad, majestic, well-balanced figures, treated in very high relief. In 1265 Nicola was commissioned to execute a similar pulpit for the cathedral at Siena, in which he was assisted by his son, Giovanni Pisano (qv), and his other pupils, Arnolfo (qv), Lapo Goro, and Donato. This pulpit was completed in 1268, and while richer in form and sculpture than that at Pisa, has less unity of style. Meanwhile (1265) Nicola had furnished a colleague, Fra Guglielmo d' Agnello, with the designs for a monumental carved marble shrine for the church of San Domenico at Bologna, completed in 1267, the "Arca di San Domenico." None of the reliefs or statues, however, was executed by his hand. Shortly before his death he designed, in 1274, and partly decorated with sculptures the beautiful public fountain at Perugia (see FOUNTAIN), completed by his son Giovanni; the statuettes rather than the reliefs are supposed to be by the father's hand.

As a sculptor Nicola first freed Italian sculpture from the shackles of imperfect technique, created individual types, and had an ideal of beauty. With him the long line of Italian sculptors which culminated in Michelangelo really begins. He was rather the culmination of the Romanesque epoch than the creator of a new style. His son Giovanni Pisano (qv) was the real founder of Italian Gothic sculpture, slender, dramatic, and allegorical, in contrast to the heavy, calm, and classic style of Nicola. Nicola's works as an architect are less certain.

The buildings attributed to him by Vasari, in his *Life of the artist*, are all of problematic authenticity. He is said to have built in Pisa, where San Nicola (especially the tower) and Santa Caterina have been ascribed to him, as has Santa Trinità in Florence, but all without satisfactory evidence.

Supino, *L'Arte Pisano* (Florence, 1904); A. Venturi, *Storia dell' arte italiana*, vols. iii, iv (Milan, 1904-06), a standard account; A. Brach, *Nicola und Giovanni Pisano* (Strassburg, 1904); Hans Graber, *Beiträge zu Nicola Pisano* (ib., 1911); W. G. Waters, *Italian Sculptors* (London, 1911), brief and popular.

PISANO, VITTORE. See PISANELLO.

PISAREV, pē'sa-ryēf, DMITRI IVANOVITCH (1841-68). A famous Russian critic. Born at Znamenka, he graduated from the St. Petersburg Classical Gymnasium and took up philology. A successful review (1859) in the *Dawn*, a magazine for girls, caused him to turn to literature. In 1860 he placed a translation of Heine's *Atta Troll* in Blagosvyetlov's monthly *Russian World*, of which he became coeditor. *Scholastics of the Nineteenth Century* made him the idol of the youth, who asserted that "thenceforth contemporary metaphysics and mysticism were dead." In May, 1862, the monthly was suppressed. In bitter mood Pisarev rewrote a suppressed review of his for an underground publication. As a result he was shut up for nearly five years in the Schlüsselberg fortress, where he wrote his best essays. All his best efforts, critical estimates of contemporary and preceding Russian authors, as well as his popularization of natural sciences, which exercised a powerful influence on the generations of the sixties and seventies, were written here. Given liberty in 1867, he went to recuperate on the shores of the Baltic and lost his life while bathing. Rumors were rife that the government had a hand in the matter. Pisarev's fame rests on his championship of two principles—emancipation of personality and utilitarianism. Scientific achievements during the fifties, Mill's ardent plea for utilitarianism, and the liberation of serfs in 1861 account for Pisarev's ideas as well as for his popularity. Dying at 28, he left 10 volumes of critical works (2d ed., 6 vols., St. Petersburg, 1894).

PISAU'RUM. See PESABO.

PISAY. See PISÉ.

PISCAT'AQUA RIVER. A river about 8 miles in length, forming the southern part of the boundary between Maine and New Hampshire. It empties into the Atlantic, forming at its mouth the harbor of Portsmouth.

PISCES, pīs'sēz (Lat., fishes). One of the main divisions, or phyla, of cold-blooded vertebrates, including the fishes in the more restricted sense. It is well marked off from the lampreys, which are commonly called fishes, and is characterized by the presence of persistent gills and the possession of paired appendages in the form of fins. See FISH.

PISCES. The twelfth sign of the zodiac (q.v.), running from 330° to 360° on the ecliptic (q.v.). It is denoted by the symbol ♓. The constellation Pisces contains no stars brighter than the third magnitude, but there are several double stars with components of

contrasting colors. Owing to the precession (q.v.) of the equinoxes, Aries, the first sign of the zodiac, is now situated in this constellation.

PISCHEL, pish'el, RICHARD (1849-1908). A German Sanskrit scholar, born in Breslau and educated there and in Berlin. He was professor of Sanskrit in Kiel from 1875 to 1885 and then at Halle and in 1902 went to Berlin. Pischel's especial field was classical Sanskrit and more particularly the drama. He urged its independence from the Greek drama and was particularly fortunate in his conjectures of dates and authors for famous plays. But he wrote as well on the Vedic period, publishing *Vedische Studien* (3 vols., 1889-1901), with Geldner, and on Prakrit grammar, *Hemacandras Grammatik der Prakritsprachen* (1877-80); a Prakrit dictionary, *The Deçināmāṇī of Hemacandra* (1880), with Bühler; *Grammatik der Prakritsprachen*, etc. (1900). His further work includes: *Kālidāsa's Āṅkuntalā; The Bengali Recension* (1877); *Rudrāṭa's Āṅgārātilaka* (1886), a rhetorical work; *Die Heimat des Puppenspiels* (1900; Eng. trans. by Mildred Tawney, London, 1902); *Materialien zur Kenntnis des Apabhramsa* (1902); *Leben und Lehre des Buddha* (1906); *Die indische Literatur in Die orientalischen Literaturen* (1906).

PIS'CICULTURE. See FISH CULTURE.

PISCINA, pīs-sī'nā (Lat., fish tank). A water tank, especially the cold plunge or swimming basin for a Roman bath. In ecclesiastical and modern usage, a small basin supplied with running water, particularly such a basin in a decorative setting applied to or set in a wall, as in the chancel of a church for the washing of the chalice after mass or in the sacristy for the use of the clergy. These were often highly ornate in the mediæval and early Renaissance periods, consisting of a wall niche, either single or double, richly adorned, containing one or two faucets and a sculptured basin projecting from the wall.

PISCINA MIRABILIS. See MISENO, CAPE.

PISÉ, pēz'ā, or **PISAY** (Fr., pounded, brayed, crushed). The material and the process of using earth of a clayey consistency for building by stamping it hard in place to drive out the moisture. Any soil that is found to pack in the hand may be used. Where the soil is very fat, with much clay in it, this construction is capable of enduring many years. It is sometimes called *adobe* (q.v.) in the Southwestern States. The material differs from crude or unburned brick in being made up in the mass instead of being shaped in blocks for building. See BRICK.

PISEK, pīs'ēk. A small town of the Crownland of Bohemia, Austria, situated on the Wotawa, an affluent of the Moldau, 55 miles southwest of Prague (Map: Austria, D 2). It is still partly surrounded with walls, has an old castle, a Gymnasium, a Realschule, and schools of agriculture and forestry. The manufactures are woolen and cotton fabrics, iron wire, and musical instruments. Pop., 1900, 13,574; 1910, 16,474.

PISEMSKI, pē'syēm-skē, ALEXEI FEOFILAKTOVITCH (1820-81). A Russian novelist, born in the Government of Kostroma. He was educated in Kostroma and at the University of Moscow. Until his retirement in 1874 he was in the government service. His literary activity dates from *Boyarshchina* (1847). There followed *Tyufyak* (1850), *A Love Match*, and the drama

of peasant life, *A Bitter Lot* (1853), *Pitersh-chik*, and *A Thousand Souls* (1858). In these Pisemski appears as a severe realist, picturing life in its lower aspects without compassion or censure and at times verging on cynicism. His pessimism discovers only the basest motives for all action. In *A Thousand Souls* he dwells only on the shortcomings of the liberal movement. With a heart embittered by his critics, he published in 1863 his last great effort, *Troubled Waters*. The works following it, *Men of the Forties* (1869), *Whirlpool* (1871), *Burgesses* (1877), *Freemasons* (1878), and many plays, showed a falling off in his powers. Grief at the death of his two sons, both professors at the Moscow University, hastened his end. His works were published in 24 volumes (St. Petersburg, 1895).

PISGAH, piz'gá (Heb. *Pisgah*, boundary, from *pāsag*, to divide). A mountain of the Abarim Range, east of the Dead Sea. It is to be noticed that "Pisgah" never occurs by itself in the Old Testament, but always with the definite article in connection with "top" or "slopes." In Deut. xxxiv. 1 the "top of the Pisgah," from which Moses viewed the promised land, is identified with Mount Nebo (q.v.), and in the days of Eusebius "Fasga" was still used for the region of Mount Nebo. The double name may, for all that, point to varying traditions in regard to the incident in the career of Moses.

PISIDES, pis'i-déz (Lat., from Gk. *Πισίδης*), GEORGIOS. See GEORGE, called PISIDA.

PISIDIA (Lat., from Gk. *Πισιδία*). An ancient division of Asia Minor, bounded on the north by Phrygia, east by Cilicia, south by Pamphylia, and west by Lycia (Map: Greece, Ancient, G 3). It belongs to the modern Turkish Vilayet of Konieh. It was drained by the Cestrus, Eurymedon, and Melas, the chief rivers of Pamphylia. The principal towns were Selge, Termessus, and Sagalassus. Antioch, sometimes called the Pisidian, seems to have been really in Phrygia. The wines of Amblada in Pisidia were celebrated, and salt and olives were chief productions. The country is wild and mountainous, abounding in picturesque scenery, and the inhabitants were bold and lawless freebooters who defied subjugation (according to Xenophon, the first writer to mention the Pisidians, *Anabasis*, i, 1, 11; ii, 1, 4). The cities, however, were gradually Hellenized, and in Roman times the country seems to have enjoyed great prosperity, as is indicated by the splendid ruins at several places. Consult Lanckoronski, *Städte Pamphylens und Pisidiens* (Vienna, 1890).

PISISTRATUS, or **PEISISTRATUS** (Lat., from Gk. *Πεισιστρατος*, *Peisistratos*) (?-c.527 B.C.). The famous tyrant of Athens, son of Hippocrates and intimate friend of the lawgiver Solon, with whom he was closely related on his mother's side. He received an excellent education, and the charm of his manners as well as the generosity of his spirit was so great that, according to Solon, had he not been ambitious he would have been the best of the Athenians. But his desire for sovereign power led him to adopt a policy of artifice to attain his ends, which has deprived him of the reputation that the kindly character of his government might otherwise have obtained for him. Pisistratus first became prominent in connection with the war between Megara and Athens, which culminated in the capture of the Megarian seaport Nisæa and the island of Salamis by Athens about

570-565 B.C. In this struggle he may have held the office of polemarch, and his ambition then spurred him to take advantage of the popularity thus gained to seize the sovereign power. He came forward as leader of one of the three parties into which Attica was then divided. These were the Pediaci (*Πεδιακοί*), or the Party of the Plain, consisting of the well-to-do landed proprietors; the Parali (*Παραλοί*), the Party of the Seaboard, to which belonged the wealthy merchant classes; and the Diacrii (*Διακρίοι*), the Party of the Highlands, chiefly a laboring population, jealous of the rich and eager for political equality. (In the *Journal of Hellenic Studies*, 1906, however, P. M. Ure argued that the Diacrii were rather the miners of Laurium, q.v.) Pisistratus joined the Diacrii, and by his liberality attached to himself all the poorer citizens and the discontented. When the time came for a decisive step, he drove into the market place, and there, exhibiting certain wounds actually self-inflicted, called upon the people to protect him against his and their enemies, alleging that he had been attacked on account of his patriotism. Thereupon his followers, according to Plutarch, were ready to take up arms for him, a general assembly of the citizens was summoned on motion of Aristion, one of his supporters, and it was voted to allow him a bodyguard of 50 men armed with clubs. Tradition says that Solon charged him with hypocrisy, but in vain. Pisistratus gradually increased the number of his armed attendants, and about 560 B.C., when he felt himself strong enough, he seized the Acropolis and established himself as tyrant over Athens. The leaders of the aristocratic party immediately fled from the city. What action Solon took is not definitely known; he died within two years after the establishment of Pisistratus' irresponsible rule. This rule, however, was not harsh or vindictive. Pisistratus attempted to continue unchanged the constitution laid down by Solon himself and conferred many benefits upon the poorer citizens. But the parties of the Plain and the Seashore united against him and in five years succeeded in driving him out. This coalition in turn was soon broken up, and Megacles, one of its leaders, made overtures to Pisistratus and secured his return. A family quarrel between them, however, caused a second expulsion of the tyrant about 550. He retired to Eubœa, where he remained for 10 years, watching for his opportunity and making preparations to secure his return. He gained a following in many of the Greek cities, exploited the gold mines of Mount Pangæus, near the Strymon, and collected a force of mercenary soldiers. At length he was strong enough in friendship with other Greek states to attack Athens. When he landed at Marathon adherents flocked to his standard, and, after defeating the constitutional party, he reestablished himself for the third time as tyrant, about 540. He continued to hold this position without interruption until his death in 527 (528). Then his power passed into the hands of his sons Hippias and Hipparchus (q.v.).

Pisistratus' rule was mild and beneficent. He reduced taxes, established the poorer citizens on estates, supplying them with the needed resources, cared for the old and the disabled, and extended Athenian influence abroad. He recovered Sigeum, which commanded the entrance

to the Hellespont, and acquired the Thracian Chersonese. His administration is famous also for his encouragement of literature and the arts. Under his direction a splendid temple to Athena was erected on the Acropolis, and the Lyceum was built. He erected also a temple to Dionysus in Limnæ and established a new sanctuary for this god at the foot of the Acropolis. He began the great temple of Olympian Zeus, which was not finished till the reign of the Emperor Hadrian. (See ATHENS, *History*, next to last paragraph.) He carried through many internal improvements also, the most significant being that of the water supply. He purified Delos (q.v.), the great shrine of the Ionian race, by removing all bodies buried within the sacred precinct. He made the Athenian religious festivals, in particular the great Panathenaic festival, more magnificent than they had ever been before. (See PANATHENÆA.) He had a new edition of the Homeric poems prepared by poets and scholars resident at his court. Consult the standard histories of Greece, and Robert von Pöhlmann, *Grundriss der griechischen Geschichte* (5th ed., Munich, 1914). See HOMER.

PISO. A Roman family of the plebeian gens (q.v.) Calpurnia. (See CALPURNIUS.) The agnomina (see AGNOMEN) of the family were Frugi, Cæsoninus, and Licinianus. Its more important members are: LUCIUS CALPURNIUS PISO FRUGI. In 149 B.C., as tribune of the plebs, he brought up the first law against extortion (*Lex Calpurnia de Repetundis*); in 133 he was consul, fought in the Servile War in Sicily, and was censor in 120. He opposed the reforms of the Gracchi. He is best known as author of an annalistic history of Rome down to his own time, of which a few fragments are published in Peter's *Historicorum Romanorum Reliquæ*, vol. i (Leipzig, 1870, 1914), and in the same writer's *Historicorum Romanorum Fragmenta* (ib., 1883). Consult also M. Schanz, *Geschichte der römischen Literatur*, vol. i, part i; 3d ed. (Munich, 1907).—LUCIUS CALPURNIUS PISO CÆSONINUS was the father-in-law of Julius Cæsar and in 58 became consul as a tool of Cæsar. He supported Clodius (q.v.) against Cicero, caused the banishment of the latter, and was twice vehemently attacked by Cicero for vicious administration of the Province of Macedonia. Having become censor in 50, Piso attempted to mediate between Cæsar and the aristocratic party, but was unsuccessful and, failing to join Cæsar in the Civil War, now won Cicero's hearty approbation. After Cæsar's murder Piso seems to have sided with Antony.—His son, who bore the same name (48 B.C.–32 A.D.), was high in the favor of Augustus and Tiberius, held the consulship (15 B.C.), and as prefect of the city (17 A.D.) was highly praised by Velleius Paterculus.—GNÆUS CALPURNIUS PISO was consul with Tiberius (7 B.C.) and became his tool to check and harass Germanicus (q.v.) in the East, receiving the command of Syria (18 A.D.). He and his wife, Plancina, were suspected of poisoning Germanicus; Piso was abandoned by Tiberius, on whose orders he had acted, and in 20 A.D. committed suicide.—GAIUS CALPURNIUS PISO, a brilliant and popular young man, was robbed (37 A.D.) of his newly married wife by Caligula and banished by that Emperor. Under Nero he joined a conspiracy to murder the tyrant; on its discovery he opened his veins and died. He may be the Piso addressed in

the panegyric *De Laude Pisonis*.—The last Piso to attain fame was LUCIUS CALPURNIUS PISO LICINIANUS, an adopted member of the family, who was named by Galba as his successor to the Empire and was killed when Otho came to the throne (69 A.D.).

PISQUOW, pîs'kô. See SALISHAN STOCK.

PISSARO, pè'sà'rô', CAMILLE (c.1830–1903). A French landscape and figure painter and etcher. He was born at St. Thomas (Antilles) and studied under Fritz Melbye at Carâcas and under Corot in Paris, where he came to live in 1855. Already well known as a strong landscape painter when the Impressionist movement began, he joined the innovators and went with Monet to England, where he was influenced by Constable. On his return he settled at Pontoise (Normandy). For a time he was head of the offshoot from the Impressionists, called the Pointillistes, but afterward he resumed the usual Impressionist style. Like Monet, he is a painter of sunshine and of subtle effects of light, and, like Millet, he is the painter of the peasant and the field. His latest works are mostly views of Paris and the cities of Normandy, painted from the window of a house and always bathed in light and fresh with vibrant color. He is represented in the Luxembourg by seven paintings, including "The Red Roofs," "The Orchard," and "The Laundry." His etchings, a representative series of which is in the Luxembourg, possess great individuality and subtlety of line. Pissaro's son LUCIEN also made a name as a draftsman and wood engraver. Consult George Moore, *Modern Painting* (London, 1893), and Theodore Duret, *Manet and the French Impressionists* (Eng. trans. by J. E. C. Flitch, Philadelphia, 1910).

PISSELEU, pès'lê', ANNE DE. See ESTAMPES, or ETAMPES.

PISTACHE, pîs-tâsh'. A genus of trees. See PISTACIA.

PISTACIA, pîs-tâ'shî-â (Lat., from Gk. *πιστάκη*, *pistakê*, pistachio tree, from Pers. *pistâ*, pistachio nut). A genus of trees of the family Anacardiaceæ, having dioecious flowers without petals and a dry drupe with a bony stone which splits into two valves when ripe, exposing the bright green oleaginous kernel, which is used

PISTACHIO NUTS (*Pistacia*).

to flavor culinary preparations, ices, etc. The pistacia or pistachio tree (*Pistacia vera*), a native of Persia and Syria, now cultivated in south Europe, north Africa, and elsewhere, and in many places naturalized, attains a height of about 20 feet, has pinnate leaves, flowers in

racemes, ovate fruit about the size of an olive. In the south of Europe and in the East pistachio nuts, sometimes called green almonds, are much esteemed and are exported to some extent, although they very readily become rancid. Oil is expressed from them for culinary and other uses. In cultivation one male tree is allowed to five or six fertile ones. The mastic tree, or lentiak (*Pistacia lentiscus*), yields the gum resin called mastic (q.v.). It is a native of the countries around the Mediterranean. The turpentine tree (*Pistacia terebinthus*) yields the turpentine (q.v.) known in commerce as Cyprus turpentine, Chian turpentine, or Scio turpentine, which resembles honey in consistency, is greenish yellow, pleasant-smelling, and mild-tasting, and in its properties resembles the turpentine of the pines, but lacks acidity. The tree is about 30 or 35 feet in height, has pinnate leaves (of about three pairs of leaflets and an odd one), flowers in compound racemes, and nearly globular fruit. The kernel of the fruit is oleaginous and pleasant. The batoum tree (*Pistacia atlantica*), a round-headed tree of about 40 feet in height, a native of the north of Africa, produces a fruit much used by the Arabs and a gum resin of pleasant aromatic odor and agreeable taste. This is chewed to clean the teeth and sweeten the breath. The fragrant oil of the kernels of *Pistacia oleosa*, a native of Cochin-China, is used by the people of that country to impart a perfume to ointments.

PIS'TIL (from Lat. *pistellum*, *pistillus*, pestle). The central organ of an ordinary flower, containing the ovules and developing into the seed case. It is a term of convenience rather than of morphological exactness, for a pistil may consist of one or more carpels. This variation is recognized in the terms "simple" and "compound" pistils. See FLOWER.

PISTOLA, pē-stō'yā, or **PISTOJA**. A city in the Province of Florence, Italy, situated at the foot of the Apennines, 20 miles northwest of Florence by rail (Map: Italy, C 3). It is well built, and it is surrounded by lofty and well-preserved walls. The city played a prominent part in the early history of architecture and sculpture, and many of its churches bear marks of the influence of the Pisani. The cathedral, built in the twelfth and thirteenth centuries, contains a remarkable silver altar and a monument to Cardinal Portogruerra, considered as the first work in marble by Verrocchio. Sant' Andrea, one of the oldest churches of Pistoia, is noted for its pulpit, the work of Giovanni Pisano, and San Francesco al Prato is remarkable for its frescoes of biblical scenes. The ancient palaces of Pistoia are especially interesting. The Ospedale del Ceppo is beautifully decorated with terra-cotta reliefs (dating from the sixteenth century) and medallions representing biblical scenes. The Palazzo del Comune and the Palazzo Pretoria are both in the Italian-Gothic style of the fourteenth century. There are an imposing bishop's palace, a seminary, an academy of sciences, and two libraries. The principal manufactures are iron and steel wares, especially firearms, silks, linens, woolens, paper, and glass. Pistols are said to have been first made here, whence the name. Pop. (commune), 1901, 62,606; 1911, 67,653, (town) 13,400.

Pistoia is the Roman Pistoria, where Cati-line was defeated in 62 B.C. It was the scene of

much factional strife between the Ghibellines and the Guelphs. In the fourteenth century it became subject to Florence. Consult A. R. Sheldon, *Pistoja* (New York, 1904).

PISTOJA, CINO DA. See CINO DA PISTOJA.

• **PISTOL** (OF. *pistole*, from It. *pistola*, pistol, dagger, from *Pistoia*, from Lat. *Pistoria*, a town in Italy, near Florence). This member of the small-arms group was developed soon after the invention of the wheel lock, in the desire to supply horse soldiers with a firearm. The result was a weapon called the pistol, which was first manufactured at Pistoia in Etruria, about 1540, by Camillo Vettelli. At their first appearance they were distinguished by very short barrels and heavy, clumsy butts, which, surmounted by enormous caps, were very nearly at right angles with the barrel. It was not long, however, before the butts were lengthened out almost in a line with the barrels. The great majority of the pistols used in the sixteenth and seventeenth centuries were fitted with wheel locks, for which they were best adapted. Dag was the name of a peculiar and heavy pistol in common use towards the middle of the seventeenth century. German manufactured pistols of the wheel-lock type had also been adopted by many of the important cavalry corps of continental Europe, foremost among whom were the Ritters of Prussia. (See CAVALRY.) It is to dueling, however, that the pistol is indebted for nearly all the improvements since made in its effectiveness; for while occasional slight alterations have been made in the general pattern, the exterior appearance and method of handling the dueling pistol of the nineteenth century was virtually identical with that of the eighteenth. For military and sporting purposes the pistol has experienced many strange shapes and designs during its evolution into the modern revolver. The earliest type seems to have been an arquebus with four chambers, a specimen of which is in the Tower of London armory and is said to have been the personal property of Henry VIII. It belongs to the early part of the sixteenth century and has a barrel 2 feet, 9 inches long, and the chamber 7½ inches, the bore being about ½ inch. There is a separate flashpan for every chamber, which was covered with a sliding lid and moved in rotation beneath the serpentine. The barrel, which is secured to the spindle, is strengthened by a rod fastened to its top, and the other extremity is fixed to the butt of the gun. The lock consisted of a serpentine, passing through the stock and secured by a pivot. The serpentine extended below and behind the pivot and thus formed a trigger, which on being pressed allowed the serpentine to fall into the flashpan, the weight of the trigger acting as a balance and restoring it to its original position. In every instance the chamber had to be moved round by hand.

Devices for the combination of firearms with some other form of weapon have been frequent from the days of the first discovery of firearms up to the beginning of the twentieth century. The combination most frequently used has been the pistol and the battle-axe, examples of which in the fifteenth century are not uncommon. The Dresden Museum is especially rich in examples of these and similar weapons. Combinations of pistols and daggers were also frequently met with between the fifteenth and eighteenth centuries; since then and up to the present day inventions are constantly being recorded which

PISTOLS AND REVOLVERS

TYPICAL PISTOLS AND REVOLVERS

1. COLT AUTOMATIC PISTOL CALIBRE .45
2. BORCHARDT-LUGER AUTOMATIC PISTOL
3. SMITH & WESSON ARMY REVOLVER
4. UNITED STATES ARMY MODEL
5. COLT UNITED STATES ARMY REVOLVER

have the same principle for their base. In 1896 a patent for a combined dagger and pistol was issued from the English Patent Office, and about the same time a pistol lance was being advocated in both Russia and Germany, as an essentially effective cavalry weapon. The invention of the revolver, which is discussed under its own head, caused the pistol to be used principally for dueling and target shooting, and excellent weapons were made for these purposes. The revolver with its six or seven shots served as an important, valuable military weapon on account of its effectiveness at close range, but at the beginning of the twentieth century the pistol began again to replace the revolver for military and other purposes. These pistols, however, differed from previous types in that they were automatic in their action, firing, ejecting, and reloading by utilization of the energy of recoil. These pistols have advantages over the revolver, which supplanted the old pistol, because they possess greater power, can carry more ammunition in the magazine, and are more accurate in firing. Where in the revolver the rounds of ammunition are placed in a revolving drum, the size of which is necessarily limited, in the pistol the ammunition is carried in clips placed inside the stock. Where in the revolver the chamber is in the revolving drum and therefore separate from the barrel, in the pistol the chamber is continuous with the bore, thereby enabling greater utilization of the power of the charge.

Many of the British officers in the Boer War of 1899-1902 were equipped with automatic pistols, while in countries like Germany, where the officers' equipment is supplied by the government, a self-loading pistol rapidly replaced the revolver. The four best-known types are the Mauser, the Burchardt-Luger, the Colt, and the Mannlicher. Probably the best European example is the Burchardt-Luger, operated by the utilization of the gas arising from its discharge, which is made to operate the mechanism, open the breech, extract and expel the cartridge, reloading and reclosing the breech for a new discharge. The firer merely replenishes the ammunition when necessary and pulls the trigger. It is capable of firing 103 shots a minute, or 48 shots in 28 seconds. It is of 7.65 millimeters (0.301 inch) in calibre and has a length of barrel of 120 millimeters. At the moment of firing the gas, acting on the base of the cartridge case, forces back the barrel and breech casing, causing them to slide along the grooves of the frame. The detachable breech follows the movement, but both breech and barrel are firmly connected. The cartridge case, which is operated by the extractor, strikes against the ejector projecting out on the interior right wall of the breech casing and is expelled, thus making way for the top cartridge of the magazine, which is forced in front of the cylinder by an interior spring. A double spring compressed by the recoil forces the detachable breech sharply forward. The trigger is pressed, the firing pin is released, and the cartridge exploded. When the magazine is exhausted the lug of the magazine presses a separate spring projecting in the frame and catching in the notch of the cylinder. At the same time the breech, instead of moving forward, is held in an elevated position in the rear. The line of sight being concealed, the firer is made aware that his weapon is empty. The pistol is recharged

with a fresh magazine, which is inserted in the butt, an operation that may be performed instantly; and as the weapon may be kept in use for a considerable time without cleaning, this constitutes one of its greatest values.

The United States automatic pistol, calibre 0.45, which replaced the Colt army revolver, is a slight modification of the Colt automatic pistol, invented by J. M. Browning. The three principal parts of the pistol are the receiver, the barrel, and the slide. The receiver has suitable guides for the reciprocating slide, and a hollow handle in which the magazine is inserted from below and locked in place by the magazine catch. The barrel of the pistol is largest at the breech and at the top has two transverse locking ribs, the forward edges of which, together with the forward edge of the breech portion, serve positively to interlock the barrel with the slide when in the firing position. On the top of the slide are mounted both the front sight and the rear sight.

The magazine may be charged with any number of cartridges from one to seven, and when charged it is inserted in the handle and the slide is drawn once to the rear. This movement cocks the hammer, compresses the recoil spring, and, when the slide reaches the rear position, the magazine follower raises the upper cartridge into the path of the slide. The slide is then released and, being forced forward by the recoil spring, carries the first cartridge into the chamber of the barrel. As the slide approaches its forward position, it encounters the rear extension of the barrel and forces the barrel forward; the rear end of the barrel swings upward on the link, turning on the muzzle end as on a fulcrum. When the slide and barrel reach their forward position, they are positively locked together by the locking ribs on the barrel, and their joint forward movement is arrested by the barrel lug encountering the pin on the slide stop. The pistol is then ready for firing.

When the hammer is cocked the hammer strut moves downward, compressing the main spring, and the sear, under action of the long leaf of the sear spring, engages its nose in the notch on the hammer. On pulling the trigger the sear is moved, and the released hammer strikes the firing pin, which transmits the blow to the primer of the cartridge. The pressure of the gases generated in the barrel by the explosion of the powder in the cartridge is exerted in a forward direction against the bullet, driving it through the bore and in a rearward direction against the face of the slide, driving the latter and the barrel to the rear together. The downward swinging movement of the barrel unlocks it from the slide, and the barrel is then stopped in its lowest position. The slide continues to move to the rear, opening the breech, cocking the hammer, extracting and ejecting the empty shell, and compressing the recoil spring, until it (the slide) reaches its rearmost position, when another cartridge is raised in front of it and forced into the chamber of the barrel by the return movement of the slide under pressure of the recoil spring.

When the magazine has been emptied the pawl-shaped slide stop will be raised by the magazine follower, under action of the magazine spring, into the front recess on the lower left side of the slide, thereby locking the slide in the open position and serving as an indicator

to remind the shooter that the empty magazine must be replaced by a charged one before the firing can be continued. Pressure upon the magazine catch quickly releases the empty magazine from the handle and permits the insertion of a loaded magazine.

MISCELLANEOUS DATA CONCERNING UNITED STATES ARMY AUTOMATIC PISTOL

Weight, 2 pounds, 7 ounces.
Trigger pull, 8 to 7½ pounds.
Total length, 8.593 inches.
Barrel:
Length, 5.025 inches.
Diameter of bore, 0.445 inch.
Rifling:
Grooves:
Number, 6.
Width, 0.1522 inch.
Depth, 0.003 inch.
Lands, width, 0.072 inch.
Twist, one turn in 16 inches, left-handed.
Front sight above axis of bore, 0.5597 inch.

This pistol has been fired 21 times in 12 seconds, beginning with pistol empty and loaded magazines on a table at side of operator. The trajectory with ammunition (model of 1911) for 250 yards has a maximum ordinate of 4.29 feet at 126 yards from the muzzle. The trajectory is very flat up to 75 yards, at which range the pistol is accurate. The angle of departure is 1° 13' 37". With the angle of departure equal to 45°, the range is approximately 1955 yards, the maximum ordinate of the trajectory being 2219 feet. The muzzle velocity of the bullet, weighing 230 grains, is 800 feet per second.

PISTOL. A character in Shakespeare's *Henry IV*, *Henry V*, and *Merry Wives of Windsor*, a braggart and blusterer, the follower of Falstaff and husband of Dame Quickly.

PISTORIA. See **PISTOLA**.

PI'SUM. The generic name of the pea (q.v.).

PITAKA, pit'ā-kā (Pali, basket). Any one of the three divisions of the Buddhist Scriptures. The three pitakas, collectively termed *tripitaka* or *pitakattaya* (basket triad), are the *Vinaya-pitaka* (Basket of Discipline), the *Suttapitaka* (Basket of Discourses), and the *Abhidhamma-pitaka* (Basket of Metaphysics). The *Vinaya-pitaka* is composed of five works, the *Bhikkhu-Vibhanga* (Monk's Division), *Bhikkhuni-Vibhanga* (Nun's Division), *Mahā-Vagga* (Great Chapter), *Culla-Vagga* (Little Chapter), and *Parivāra-Pāṭha* (Concluding Text). While much of this is dry and technical, it has many passages of interest. The *Sutta-Pitaka* is the most important of the three for the philosophy and folklore of Buddhism. It is composed of the following five books: *Dīgha-Nikāya* (Long Collection), *Majjhima-Nikāya* (Medium Collection), *Samyutta-Nikāya* (Connected Collection), *Anguttara-Nikāya* (Add-One Collection), and *Khuddaka-Nikāya* (Little Collection), which is subdivided into 15 parts, *Khuddaka-Pāṭha* (Little Text), *Dhammapada* (Religious Sentences), *Udāna* (Out-Breathing), *Itivuttaka* (Thus Said), *Sutta-Nipāta* (Descent of Aphorisms), *Vimāna-Vatthu* (Palace Stories), *Peta-Vatthu* (Ghost Stories), *Thera-Gāthā* (Stanzas of the Elders), *Thēri-Gāthā* (Stanzas of the Female Elders), *Jātaka* (Birth Stories), *Nidāsa* (Exposition), *Paṭisambhida-Magga* (Way of Analysis), *Apadāna* (Achievement), *Buddha-Vamsa* (Lineage of the Buddha), and *Cariya-Pitaka* (Basket of Conduct). The last pitaka is of all the least interesting. It is composed

of seven books, *Dhamma-Saṅgati* (Enumeration of Duties), *Vibhanga* (Division), *Kathā-Vatthu* (Subject of Discourse), *Puggala-Paṇṇatti* (Manifestation of Persons), *Dhātu-Kathā* (Discussion of Elements), *Yamaka* (Twofold), and *Paṭṭhāna* (Cause).

PITAVAI, pé'tā'vāl', FRANÇOIS GAYOT DE (1673-1743). A French legal writer. He entered the army, but afterward studied jurisprudence and in 1713 became an advocate at Paris. He is chiefly known for the compilation of *Causes célèbres et intéressantes* (20 vols., 1734-43). From him a similar collection, begun by Hitzig and Häring at Leipzig in 1842, took the name *Der neue Pitaval* (2d ed., 36 vols., 1857-72; N. S., 24 vols., 1866-91).

PITCAIRN. A borough in Allegheny Co., Pa., 15 miles by rail east of Pittsburgh, on the Pennsylvania Railroad (Map: Pennsylvania, B 6). It contains railroad yards and shops, employing almost 10,000 men, and extensive machine shops, foundries, and electrical-supply factories. There are also several coal mines and brickworks. The electric-light plant is owned by the borough. Pop., 1900, 2601; 1910, 4975.

PITCAIRN, JOHN (c.1740-75). A British soldier born in Fifeshire, Scotland. He entered the marine service and became captain in January, 1765, and major in April, 1771. For seven years he was stationed in Boston and won the respect of the citizens. He was a member of the force under command of Lieut.-Col. Francis Smith sent by General Gage to destroy the military stores collected at Concord, April 19, 1775. The minutemen at Lexington, refusing to disperse at his order, were fired upon, and seven were killed. Major Pitcairn maintained until his death that the minutemen fired before the soldiers. In the battle of Bunker Hill, June 17, he was first in the third and fourth charges and was mortally wounded by a negro soldier. His son DAVID became a distinguished surgeon.

PITCAIRNE, ARCHIBALD (1652-1713). A Scottish physician and writer, born in Edinburgh. He studied medicine in Edinburgh, Paris, and Rheims (M.D., 1680), and settled in his native city, where he remained except for a year (1692-93) at Leyden as professor of medicine. By opening a free dispensary for the poor he was permitted to perform autopsies upon those whose bodies were not claimed. Pitcairne also wrote Latin verse (published 1727) and a poem, *Babell*, in which he satirized prominent Presbyterian ministers (1692; reprinted, 1830). His *De Legibus Naturalibus* (1696) is a severe attack on Sir R. Sibbald's *Prodromus Historiæ Naturalis* and his *Dissertationes Medicæ* (1701; 2d ed., 1713) includes, among other topics, the cure of fevers by purgation, the effects of acids and alkalies, and the circulation of blood (vindicating Harvey). Pitcairne's collected works appeared in two volumes in 1722. His medical library was bought by Peter the Great of Russia.

PITCAIRN ISLAND. One of the most easterly of the Polynesian islands and the southernmost member of the Low Archipelago. It lies in the Pacific Ocean, in lat. $25^{\circ} 3' S.$ and long. $130^{\circ} 19' W.$, is about 2 miles long and 1 mile broad, and consists of a mountain surrounded by coral reefs (Map: World, M 8). It was discovered by Carteret in 1767, but was uninhabited till 1790, when it was settled by a company consisting of nine mutineers from H. M. S. *Bounty* (see BLIGH, WILLIAM) and 18 natives from Tahiti (6 men and 12 women). During the 10 years following their settlement the island was a scene of disorder and lawlessness. In the year 1808 the sole survivors of the original settlers were one Englishman by the name of John Adams (formerly Alexander Smith), 8 or 9 women, and several children, the rest having fallen victims to disease and violence. The elements of disorder having been removed, the island began to grow under the wise management of Adams. In 1808 Pitcairn was visited by an American sealing ship and in 1815 by H. M. S. *Britann*, whose captain was very favorably impressed with the peace and good order prevailing. In 1839 it was formally taken possession of for the British crown, and in 1855, when the number of inhabitants had reached 200, which was more than the island could maintain, they petitioned the British government to be removed to Norfolk Island (q.v.), which was done in the following year. Since then some of them have returned to Pitcairn, whose population by the census of 1911 was 145 (40 adult males, 45 adult females, 43 children aged 6 to 16, and 17 infants under 6). Consult: Sir John Barrow, *A Description of Pitcairn's Island and its Inhabitants* (New York, 1836); W. Brodie, *Pitcairn's Island* (London, 1850); Diana Jelliffe, *The Mutineers of the Bounty and their Descendants in Pitcairn and Norfolk Islands* (ib., 1870); T. B. Murray, *Pitcairn. The Island, the People, and the Pastor* (new ed., ib., 1885).

PITCH (assibilated form of *pick*, AS. *pician*, Ger. *picken*, to pick, connected with Eng. *pipe*). That characteristic of a sound which is determined by the rapidity of the vibrations producing it. In music there are two kinds of pitch, *absolute pitch*, which is the position of a tone considered in reference to the whole range of musical tones, and *relative pitch*, which is its position as compared with some other single tone. In ascertaining the relative pitch of a tone, C is considered the standard or starting tone, and the pitch of the tone in question is found by progressing from C either by skips of perfect fifths (quints) or by skips of major thirds (tierces). Tones determined by the former method are called *quint tones*, those found by the latter *terce tones*. Relative pitch is, however, virtually never used except for scientific purposes, since the difference in pitch between every tierce tone and its corresponding quint must be carefully calculated. For ordinary purposes the musical scale is divided into a series of octaves, to represent the absolute pitch of the notes. The absolute pitch of any tone is dependent upon the number of vibrations taking place in a second. Each musical sound is produced by a series of vibrations recurring on the ear at precisely equal intervals; the greater the number of vibrations in a given time the more acute or higher is the pitch. In stringed instruments the pitch is de-

pendent upon the length, thickness, and degree of tension of the strings; the shorter and thinner a string the greater its tension and the higher the pitch of the note. In wind instruments, where the notes are produced by the vibration of a column of air, the pitch is dependent upon the length of the column set in motion; the shorter the column of air the higher the pitch becomes. The lowest tone used in music (C⁴) is given by the largest pipes of modern organs and has $16\frac{1}{2}$ vibrations per second; but this tone is so unmusical that it is used only in conjunction with its overtones. The practicable range of musical tones is from C³ (32 vibrations a second) to c⁴ (4096 vibrations a second). The note c⁴ is the basis of modern pitch, and the history of pitch is a chronicle of the variations in the number of vibrations a second that have been assigned to that note; for, strange to say, there is no absolute standard of pitch. We have no record of what pitch was used early in the history of modern music, but at the time of Guido d'Arezzo (q.v.) the treble c⁴ seems to have had somewhere near 500 vibrations a second. Our first exact idea of pitch is gained from the sizes of organ pipes that were in use in the sixteenth century, and from these we find that it differed considerably according to localities. Different pitches were also used for secular and sacred music. Early in the seventeenth century, however, a "mean" pitch was introduced, and for about two centuries this was an approximately standard pitch, since c⁴ varied during that time only from 498 to 515 vibrations a second. This is the so-called *classic pitch*, for it was in this period that the great masters of music lived. But with the growth of the orchestra and the increased importance of wind instruments, the pitch was gradually raised in order to obtain more sonorous effects; and various efforts were made to counterbalance the difficulties involved by a varying scale of pitch. In 1834 a congress of physicists at Stuttgart adopted *Scheubler's pitch* (true c⁴-528). In 1859 a French commission of musicians and scientists reported in favor of c⁴-522. This is the widely used *French pitch*. In 1887 it was formally adopted by the Vienna Congress and is now often called *International pitch*. *Philosophical pitch* (c⁴-512) is used considerably in theoretical calculations. *Concert pitch* was a high pitch of about c⁴-540, much used in concert and operatic work during the middle of the nineteenth century. Consult A. J. Ellis, *The History of Musical Pitch* (London, 1880); Widogast Iring, *Die reine Stimmung in der Musik* (Leipzig, 1908). See ACOUSTICS; MUSIC.

PITCH. See COAL TAR; NAVAL STORES; TAR.

PITCH-BLENDE. The common name for the mineral uraninite (q.v.).

PITCH'ER, MOLLY, or MOLL (c.1744-1823). A semihistorical personage who is said to have taken the place of her husband, who was shot, as an artilleryman at the battle of Monmouth and to have saved his gun from capture by the British soldiers. Many legends have grown up about her name, and it is alleged that she received from General Washington a commission as a sergeant.

PITCHER, THOMAS GAMBLE (1824-95). An American soldier, born at Rockport, Ind. He graduated at West Point in 1845. During the Mexican War he won the brevet of first lieutenant. He was promoted captain in 1858 and

during the Civil War participated in the defense of Harper's Ferry (June, 1862) and the Virginia campaign until the battle of Cedar Mountain (Aug. 9, 1862), where he was severely wounded. He was then brevetted major in the regular army and three months later was commissioned brigadier general of volunteers, but saw no further active service. On March 13, 1865, he was brevetted lieutenant colonel, colonel, and brigadier general in the regular army, and on July 28, 1866, was commissioned colonel of the Forty-fourth Infantry. From 1866 to 1870 he was superintendent of the United States Military Academy, and from 1870 until 1877 was governor of the Soldiers Home near Washington. The next year he retired from the service and from 1880 until 1887 was superintendent of the New York Soldiers and Sailors Home.

PITCHER, ZINA (1797-1872). An American physician, born in Washington Co., N. Y. He graduated M.D. from Middlebury College in 1822 and entered the army as assistant surgeon. For 15 years he was a member of the medical corps, being appointed surgeon and president of the Army Medical Board in 1835. After his resignation he settled in Detroit, where he practiced until his death. Pitcher was regent of the University of Detroit, mayor of Detroit (1840, 1841, 1843), president of the Michigan State Medical Society (1855-56), and president of the American Medical Association (1856). During his service as army surgeon having had occasion to study the habits of the Indians, their diseases and the treatment they employed, he wrote on these as well as on other subjects. Pitcher was editor of the *Peninsular Medical Journal* in 1855, 1856, and 1858.

PITCHER PLANT. See cut in article CARNIVOROUS PLANTS; NEPENTHES; SARRACENIA.

PITCH PINE. See PINE, and Plate of PINES.

PITCH/STONE'. An igneous rock of glassy or lithoidal texture, rich in contained water. To this abundance of water in their composition pitchstones owe their lustre, from which they receive their name. The term "pitchstone" is not used to indicate any particular composition of rock, but rather to designate a texture that may occur with rocks of any chemical composition, though it is developed in larger masses in the case of magmas of siliceous composition. Pitchstone differs from obsidian in containing much water, while obsidian (q.v.) is nearly or quite water-free. The most remarkable pitchstones occur upon the island of Arran, Hebrides, and near Meissen, Saxony.

PITCH/URIM BEAN. The seed of a tropical tree. See GREENHEART.

PITESCI, pi-tyesht/yi. A town of Rumania, on the main railroad, 65 miles northwest of Bucharest (Map: Balkan Peninsula, E 2). It has some trade. Pop., 1899, 15,570.

PITH (AS. *pīpa*, pith). The central cylinder of soft tissue (parenchyma) inclosed by the woody cylinder of vascular plants (pteridophytes and spermatophytes). It frequently dies, decays, and leaves the stems hollow, as in the elder. The two types of vascular cylinder are distinguished by the presence or absence of pith, the solid cylinder (without pith) being called a protosteles and the hollow cylinder (with pith) being called a siphonosteles. Siphonosteles are characteristic of gymnosperms and dicotyledons.

PITH/ECANTHROPUS. See MAN, SCIENCE OF, *Ancient Types*.

PITHOM. One of the store cities which, according to Ex. i. 11, were built by the Israelites during the Egyptian bondage. Naville, who conducted excavations in the Eastern Delta in 1883 for the Egyptian Exploration Fund, identified it with the Egyptian city of Per-Tum (abode of Tum) (Coptic Pethôm), whose site is occupied by the mound of Tell el Maskhutah (hill of the statue), so called from a sculpture found there representing Ramses II standing between the gods Re-Harmachis and Tum. It is situated in the Wadi Tûmilât, about 12 miles from Ismaïlia. Pithom seems to have been built by Ramses II to serve as a base of supplies for his armies operating in Asia, and was strongly fortified. Naville found there the remains of a great quadrangular wall of brick inclosing a space of about 55,000 square yards, within which were the ruins of a temple and a number of chambers constructed for the storage of grain. In later times, especially under the Ptolemies, the city was a place of considerable importance, and it was still in existence at a late date under the Roman Empire. By the Greeks it was called Heroôpolis. Scholars are not yet agreed as to whether the story of the building of Pithom and Raames by the Israelites has a foundation in actual historic fact. According to biblical chronology Moses was born 1576 B.C. It must then have been before this time that the King, who knew not Joseph and massacred the Hebrews' children, forced the Israelites to build the store cities. But Ramses II, after whom one of them is named and who built the other as well, reigned c.1310-1244. It is not impossible, however, that Hebrews living in Goshen (q.v.) were forced to assist in the building of Pithom by Ramses II centuries after the invasion of Syria. (See JEWS.) Consult H. N. Naville, *The Store-City of Pithom and the Route of the Exodus*, Memoir I of the Egyptian Exploration Fund (3d ed., London, 1888), and W. Max Müller, in *Encyclopædia Biblica* (New York, 1902).

PITH RAY. See MEDULLARY RAY.

PIT/KIN, TIMOTHY (1768-1847). An American lawyer, politician, and historian. He was born in Farmington, Conn., graduated at Yale College in 1785, studied law, and was admitted to the bar. He was for five years Speaker of the Lower House of the State Legislature and was a Federalist member of Congress from 1805 to 1819. (See FEDERALISTS.) He is remembered, however, chiefly as the author of *A Statistical View of the Commerce of the United States of America* (1816) and a *Political and Civil History of the United States from 1763 to the Close of Washington's Administration* (2 vols., 1828), both of which are written with great care and, though now largely superseded by other works, are still frequently consulted by students of American history.

PIT/MAN, BENN (1822-1910). A British-American author of phonographic works and a wood carver. He was born at Trowbridge, Wiltshire, England, the younger brother of Isaac Pitman (q.v.), came to the United States in 1853, and settled in Cincinnati, Ohio, where he founded the Phonographic Institute. He invented the electro process of relief engraving, and in 1873 became connected with the Cincinnati School of Design as teacher of descriptive art, especially of wood carving. In this

latter field he introduced what has since become known as the Pitman school of wood carving, which provides for the treatment of naturalistic designs and admits of beautiful effects. His influence as an artist was considerable throughout the middle West. He is the author of numerous works on phonography, of a *Plea for American Decorative Art* (1895) and a *Life of Sir Isaac Pitman* (1902).

PITMAN, SIR ISAAC (1813-97). The inventor of the Pitman system of phonography. He was born at Trowbridge, Wiltshire, England, was educated at the normal college of the British and Foreign School Society of London, in 1832 began to teach a school at Barton-on-Humber, Lincolnshire, and was afterward master of several other schools. In 1837 he published *Stenographic Sound-hand*, an exposition of the phonographic method, to the improvement and diffusion of which he directed every effort. When the English government offered a prize of £200 for the best method of collecting the pence for prepaid letters, Pitman submitted a proposal to collect the postage by means of stamps such as are now used everywhere. He pointed out that, besides the advantage to the government, the public would find it convenient to send small amounts of money in this way. In 1842 he established the weekly *Phonographic Journal*, afterward named the *Phonetic Journal*, which he edited for more than 50 years. Pitman issued many pamphlets advocating radical reform in English spelling. He was knighted in 1894. Consult T. A. Reed, *Biography of Isaac Pitman* (New York, 1890), B. Pitman, *Life of Sir Isaac Pitman* (ib., 1902), and Alfred Baker, *Life of Sir Isaac Pitman* (Centenary ed., London, 1913). For a description of his system, see **SHORTHAND**.

PITNEY, MAHLON (1858-). An American jurist, son of Vice Chancellor H. C. Pitney, born at Morristown, N. J. He was educated at Princeton (A.B., 1879; A.M., 1882), and, admitted to the bar in 1882, practiced at Morristown. As a Republican he was elected to Congress in 1894 and reelected in 1896. Leaving Congress to become a leader in State politics, he was elected to the State Senate in 1898, serving as president of that body in 1901. From 1901 to 1908 he was associate justice of the New Jersey Supreme Court, and thereafter until 1912 he was chancellor, the highest judicial position in the State. In the latter year he was appointed by President Taft to the United States Supreme Court as the successor of Justice Harlan. He became known as one of the more conservative interpreters of the Constitution.

PITO, pé'tó. See **CHICA**.

PITOMETER. An instrument for determining the flow of a liquid in a closed channel or pipe by the measurement of its velocity. This self-registering and automatic instrument was developed from the tubes devised in 1732 by the French hydraulic engineer Pitot. He used an L-shaped tube, the long arm of which stands vertically in the liquid, while a very short or horizontal arm terminates in an orifice. As used for measuring the flow of water in mains under pressure one Pitot tube is held with its orifice turned towards the approaching current, while the orifice of the other tube points towards the receding flow. In the former the water flowing in causes the level to rise above that outside, while in the tube the short arm of which points towards the direction of the current there will be a corresponding fall. The

velocity is obtained by the formula $V = c\sqrt{2gh}$, where V is the velocity, c a constant or factor that has to be determined by experiment, g the accelerating force of gravity, and h the height of water in the tube.

From simple Pitot tubes D'Arcy and other hydraulic engineers evolved a series of instruments for current measurement in open channels, and from similar devices employed advantageously to study the flow of water in pipes the modern pitometer has been developed. In this the tubes are mounted on a rod which can be inserted in the water main under investigation through an ordinary 1-inch standard corporation cock without disturbing the flow of water or producing waste. A photographic device is used to record the change of level in the tube.

The pitometer enables the observer to determine the velocity at any point in a water main; and by determining this quantity for a series of concentric rings, the average velocity for the entire flow can be computed, and after certain computations are made tables can be evolved that will give a method of measuring the flow in the pipe at any and all times, correct within 2 per cent. This enables water engineers to investigate the conditions under which a distribution system is operated, and has been the means of saving many thousands of gallons of water by detecting not only illicit and irregular consumption, but underground leaks, which naturally are hidden by the surrounding soil and pavements.

Consult: American Society of Civil Engineers, *Transactions*, vol. xlvii (New York, 1902), American Society of Mechanical Engineers, *Transactions*, vol. xxv (ib., 1904); E. S. Cole, in *Technology Quarterly*, vol. xx (Boston, 1907).

PITONI, pé-tó'né, GIUSEPPE OTTAVIO (1657-1743). A composer of the Roman school, born at Rieti. He was a pupil of the famous Pompeo Natale at Rome, and afterward studied counterpoint under Foggia. Throughout his life he was connected in various musical capacities with most of the important churches of Italy, and at the time of his death was church *maestro* of San Marco, Rome. Most of his compositions have remained in manuscript and have been carefully treasured by the churches to which they belong. During his lifetime only one book of motets (1697) was printed. One of his most famous compositions is a *Dixit* arranged for 16 parts, or four choirs, which is sung annually during Holy Week in St. Peter's, Rome. He died in Rome.

PITRÉ, pé'trá', GIUSEPPE (1843-1916). An Italian folklore scholar of Palermo, a great authority on the antiquities, traditions, dialects, and national songs of Sicily. He was one of the founders of the *Nuove Effemeridi Siciliane* (1868) and of the *Archivio per lo studio delle tradizioni popolari*. His great work is the *Biblioteca delle tradizioni popolari siciliane* (19 vols., 1870-95). In addition he published *Curiosità popolari tradizionali* (10 vols., 1885-91) and *Bibliografia delle tradizioni popolari d'Italia* (1894).

PITRI, pit'ré (Skt. *pitṛ*, father). A term in Hindu religion applied to three classes of divine beings. In the Rig-Veda the pitris are the souls of the righteous dead who dwell in paradise, or the third heaven, with Yama (q.v.), and to whom sacred balls of rice and flour together with water are duly offered. (See **SRADDHA**.) In the Atharva-Veda they are divided into higher

and lower classes, the older manes being in general the more venerated and blessed. After the Vedic period the pitris lose their importance as distinct objects of cult, although sacrifices are still offered to them in India. In its second usage the term is applied to the ten Prajapatis, or progenitors of mankind. (See PRAJAPATI.) In the later Hindu period, however, the pitris denoted a much larger class of semidivine beings who taught the gods the rituals of expiation. Manu (q.v.) enumerates various classes of pitris—those who were the ancestors of the gods, those who were the ancestors of the demons, and those from whom the four castes proceeded. The Puranas divided the manes generally into seven classes, three of which are without form, or composed of intellectual, not elementary, substance, and assume what forms they please, while the four other classes are corporeal. Consult L. D. Barnett, *Antiquities of India* (London, 1913).

PIT RIVER INDIANS. A group of small tribes of Shastan stock, occupying the volcanic mountainous region along Pit River, a head stream of the Sacramento, in northeastern California. From their custom, not known among other California tribes, of digging deep pitfalls for trapping deer, the river is said to obtain its name. The pitfalls, which were dug along deer trails and at watering places on the river, caused so many losses of cattle to the early settlers that the Indians were finally compelled to abandon the practice. See SHASTAN STOCK.

PITSCOTTIE, ROBERT LINDSAY OF (c.1500–c.65). A Scottish chronicler, born at Pitscottie, Ceres Parish, Fife. Connected with the noble family of Lindsays, he was a landowner in his native place, and is remembered chiefly for his *Chronicles of Scotland* (first published 1728), which cover a little-known period—from the death of James I to that of James III. If not entirely accurate, they are highly interesting in their picturesqueness of style and dialect and in the description of people and events. Sir Walter Scott in *Marmion* (the vision that appeared to James I before his march to Flodden) and Mrs. Oliphant in *Royal Edinburgh* (1891) are indebted to Pitscottie's *History*. A good edition of the work just mentioned was prepared by G. Dalrymple in two volumes (1814).

PITT, THOMAS (1653–1726), known as "Diamond Pitt." See PITT DIAMOND.

PITT, WILLIAM, first EARL OF CHATHAM (1708–78). An English statesman, often referred to as the Elder Pitt to distinguish him from his son of the same name. He was born in Westminster, Nov. 15, 1708, and was educated at Eton and at Trinity College, Oxford, but never took a degree, for he was afflicted with gout from an early age, and was advised to travel, which he did for a short time. Nevertheless the disease never left him and throughout life it remained a very serious hindrance. In 1731 he became a cornet in the army and in 1735 entered Parliament for Old Sarum, which was a typical example of the rotten boroughs. Soon after entering Parliament he was dismissed from the army for supporting Frederick, Prince of Wales, in his course of opposition to King George II, and his biting satire made him very obnoxious also to the powerful minister, Robert Walpole. Almost from the very beginning Pitt was a power among the Commons on account of his oratorical abilities, and he contributed much to bringing about the downfall of Walpole in

1742. Thereafter he opposed the foreign policy of Carteret, especially the practice of paying subsidies to the continental Powers. His policy became very popular among the people; the Duchess of Marlborough left him in 1744 a legacy of £10,000, and in 1765 Sir William Pynsent, an eccentric gentleman, struck with admiration for Pitt's patriotism, left him his whole estate, worth between £3000 and £4000 a year. Late in 1744 some of Pitt's associates obtained seats in the cabinet of Pelham, but the King had not yet forgiven Pitt. In 1746 the government resigned, but shortly resumed power, and Pitt was appointed joint Vice Treasurer of Ireland, and in the same year he obtained the lucrative office of paymaster general of the forces and became a member of the Privy Council. At this time he received great praise for declining the special emoluments which usually went with the office of paymaster general. In 1755, when Henry Fox (afterward Lord Holland) was made Secretary of State, Pitt vigorously opposed the foreign policy of the Newcastle cabinet, and as a consequence he was dismissed from office. Meanwhile the Seven Years' War (q.v.) had begun, and though Frederick the Great (q.v.) was gaining victories on the Continent, the English campaigns in America and elsewhere were unsuccessful. Hence in 1756 the King had to call upon Pitt, who had become the popular idol, to carry on the government. A new cabinet was formed, of which the Duke of Devonshire was the nominal Prime Minister, but all real power was vested in Pitt. The latter immediately began vigorous measures to carry on the war, but the King did not give him loyal support and finally dismissed him (April 6, 1757). He had, however, to recall him almost immediately in response to the demands of the nation, and Pitt was given full control of foreign and military affairs.

Pitt's war policy was characterized by unusual vigor and sagacity. French armies were defeated in India, Africa, and Canada, and on the Rhine, and French fleets disappeared from the seas. Pitt was virtually absolute ruler of Britain, and the populace bestowed on him the title of the Great Commoner. A change came, however, with the accession of George III in 1760. Pitt was forced to take Lord Bute into the cabinet, and finally was compelled to resign (Oct. 5, 1761). As some recompense for his important services Pitt received a pension of £3000 a year, and his wife, sister of George Grenville (q.v.), received the title of Baroness Chatham. Until 1766 Pitt remained out of office, occasionally employing his eloquence to defeat obnoxious measures of the government, and he opposed vigorously the various acts to tax the American colonists. On July 30, 1766, Pitt succeeded in forming a new ministry to succeed the Rockingham cabinet, and, as his health was very poor, he took the sinecure office of Privy Seal and was created Viscount Pitt and Earl of Chatham. His acceptance of the peerage was very unpopular, and he lost considerable influence also because his impassioned eloquence was unable to move so small a body of men as were accustomed to attend the House of Lords. Impaired health prevented Chatham from taking an active part in the ministry, of which he was nominally the head, and he resigned on Oct. 14, 1768, never to hold office again.

Chatham, however, did not cease to take an

interest in public affairs. He spoke strongly against the arbitrary and harsh policy of the government of Lord North towards the American colonies, and did his utmost to procure an amicable settlement of the differences, declaring that "England had no right under heaven to tax the colonists." But when America entered into a treaty with France and it was proposed to remove the ministers and make peace on any terms, Chatham, though in a dying state, appeared in the House of Lords and in a powerful address protested against the disruption of the Empire and the implied prostration of Great Britain before France. It was the orator's last effort; exhausted by speaking, on rising again to reply to a query addressed to him, he suddenly fell back into the arms of his friends. He died a few days later (May 11, 1778). He was honored with a public funeral in Westminster Abbey, where a statue was erected to his memory at the public expense. In addition the government gave £20,000 to pay his debts and conferred a pension of £4000 a year on his descendants.

Macaulay, *Two Essays on William Pitt* (new ed., Oxford, 1913).

PITT, WILLIAM (1759-1806). An English statesman, often referred to as the Younger Pitt to distinguish him from his father, William Pitt, first Earl of Chatham. He was born May 28, 1759, on his father's estate at Hayes. His mother was a sister of the well-known statesman, George Grenville (q.v.). Pitt, on account of his delicate health, was educated at first at home, but when 14 years of age he was matriculated at Pembroke Hall, Cambridge, where he developed a passion for mathematics and the classics of Greece and Rome, and was graduated in 1776, receiving the degree of M.A. He then studied law at Lincoln's Inn and in 1780 was admitted to the bar. In the same year he was elected to Parliament from Appleby, taking his seat on Jan. 23, 1781. He immediately joined the party that had followed his father, and hence was in opposition to the government of Lord North. His maiden speech made a favorable impression; and when in 1782 Rockingham formed a new administration, a well-paying subordinate position, the vice-treasurership of Ireland, was offered to Pitt, but, though poor, he declined it. He had decided that he would accept nothing except a cabinet office.

On May 7, 1782, Pitt made his first motion for

a reform in the representation to Parliament. The motion was lost by a narrow margin, the vote being 161 against 141. The reformers did not make so good a showing again until 1833. Three months after his accession to office Rockingham died, and Lord Shelburne became Prime Minister, while Pitt, though only 23 years of age, became Chancellor of the Exchequer. The cabinet was met by a formidable coalition led by Charles James Fox (q.v.) and Lord North, and in 1783 Shelburne resigned. George III offered Pitt the premiership, but he declined, as he was not certain of the consistent support of the dominant factors in Parliament. The result was a coalition ministry under the Duke of Portland, in which Fox and North were the leaders. Pitt on May 7, 1783, again brought forward the question of parliamentary reform, but, though his plan this time was definite and well-ordered, the motion was lost by 293 to 149.

After Parliament had been prorogued Pitt visited the Continent and was well received. On Dec. 19, 1783, the coalition ministry was dismissed after the defeat of a bill in the House of Lords which aimed to transfer the government of India to Parliament. Thereupon Pitt assumed the premiership in the face of a powerful opposition in the House of Commons. His position was desperate. The House of Commons resented the interference of the King, whose action was of doubtful constitutionality. Between Dec. 17, 1783, and March 8, 1784, Pitt was defeated in 16 divisions. The only recourse was either to resign or to order a new election; but Pitt postponed the election as long as possible. When at last he saw that the current of popular opinion had set in his favor, he dissolved Parliament, and the election proved to be a triumph for his administration, he himself being returned for the University of Cambridge, for which he sat for the rest of his life.

Pitt was 25 years old at this time and was the most powerful subject that England had had for generations. He ruled absolutely over the cabinet, and was at once the favorite of the sovereign, of Parliament, and of the nation. When Parliament met Pitt's first work was the ordering of the finances, for enormous deficits had existed for many years. In this he was very successful. In 1784 he established a new constitution for the East India Company, the Board of Control being instituted. In 1785 he introduced his third reform bill, providing for the purchase of 72 rotten boroughs, but the bill failed to pass, and the outbreak of the French Revolution soon afterward put an end for many years to serious attempts at parliamentary reform. Pitt was the first British statesman to attempt to put into practice the principles enunciated in 1776 by Adam Smith. His bill, however, providing for free trade between England and Ireland failed in 1785. In the following year Pitt was successful in negotiating a liberal commercial treaty with France. In 1792 he supported Wilberforce's proposal for the abolition of the slave trade, but he could not carry the House of Commons with him. In the war between France on the one side and Austria and Prussia on the other he maintained strict neutrality so long as he was able, but the Paris massacres of September, 1792, and the execution of Louis XVI in January, 1793, so outraged the feelings of the English people that peace could no longer be maintained. In February, 1793, the French Convention declared war against Eng-

nd. While the English were successful on the a, Pitt opposed the French on land principally means of heavy subsidies to his continental allies, thus inaugurating the system which was followed throughout the Napoleonic wars. In a persistent enmity towards Napoleon he was opposed throughout by his great rival, Fox. While the financial difficulties caused by the outbreak of the war with France were at their height, Irish affairs also became very perplexing. Pitt desired to relieve the Catholics of the disabilities under which they were laboring, but George III compelled him to withdraw all such schemes. In 1800-01 a parliamentary union with Ireland was effected, but it by no means allayed discontent. In order to relieve some of the financial difficulties of the nation, Pitt created a sinking fund, which at considerable cost maintained the credit of the government. Meanwhile Napoleon had defeated Austria in Italy, while Prussia became neutral, so that England was left to struggle with France alone. In 1801 Pitt resigned because the King refused to accept his Catholic emancipation measures. He loyally supported the new ministry of Addington in its attempt to make a permanent peace, which resulted in the Treaty of Amiens in 1802. When Pitt was no longer able conscientiously to aid Addington he withdrew from active participation in affairs. His health was poor and his finances were in disorder. On May 16, 1803, war was declared by England against France, and Pitt at once reappeared to aid his country. He criticized the weakness of the government, and on May 10, 1804, again became Prime Minister. Pitt's vigorous measures resulted in the third great coalition against France, but, though he victory of Trafalgar cheered him, the defeat of Austria and her ally, Russia, at Austerlitz on Dec 2, 1805, proved his deathblow. Shortly before he died he uttered the prophetic words, so well known: "Roll up the map of Europe; it will not be wanted these 10 years." He died Jan 23, 1806, and was buried on February 22 in Westminster Abbey. His work did much to bring about the ultimate downfall of Napoleon, and in many respects Pitt may be considered England's greatest Prime Minister.

Bibliography. Pitt's *Speeches in the House of Commons* have been published in three volumes (London, 1817); while an account of his parliamentary career is to be found in the *Parliamentary History* (36 vols., ib., 1803-10) and in Hansard, *Parliamentary Debates*. Consult also: Earl Stanhope, *Life of William Pitt* (2d ed., London, 1862), which is the best work on this subject; T. E. May, *Constitutional History of England* (ib., 1863-65); Lord Rosebery, *William Pitt in "Twelve English Statesmen Series"* (ib., 1891); W. E. H. Lecky, *History of England in the Eighteenth Century* (7 vols, ib., 1892-93); A. T. Mahan, *Influence of Sea Power upon the French Revolution* (Boston, 1893); Lord Ashbourne, *Pitt: Some Chapters of his Life and Times* (New York, 1898); William Hunt, *The History of England from the Accession of George III to the Close of Pitt's First Administration* (ib., 1905); Charles Whibley, *William Pitt* (Edinburgh, 1906); T. B. Macaulay, in *Critical and Historical Essays*, vol. ii, in Everyman's Library (New York, 1909); J. H. PITT, WILLIAM (1773-1857). See AMHERST, EARL OF.

PITT, WILLIAM. See LENNOX, WILLIAM PITT, LORD.

PITTA (from Telugu *pitta*, a small bird). One of a group of passerine birds, known as *brèves* by the French. The characteristics are brilliant plumage, a very short tail, long legs, with scutellated tarsi, and, generally, a strong bill. They were long supposed to be allied to the thrushes and several were called ground thrushes and ant thrushes in the books; but they are now understood to be more nearly related to the American flycatchers. About 60 species have been described, inhabiting the Malay archipelago, China, India, and Australia, while one species occurs in western Africa. Their habits are terrestrial chiefly, and they live amid rocks and brush, hunting mollusks and insects among the fallen leaves, or digging for worms and ants. They are shy, quick, and not so often seen as their plaintive, whistling notes are heard. All are small birds of gaudy plumage, which shows such colors as scarlet, blue, and green. They make their nests on the ground and lay spotted eggs. Consult: Newton, *Dictionary of Birds* (London, 1893); A. H. Evans, "Birds," in *Cambridge Natural History*, vol. ix (New York, 1900); and authorities on Indian, Malayan, and Australian ornithology. See Plate of COINGAS.

PITTACUS (Lat., from Gk. Πιττακός, *Pittakos*) (c 652-569 B.C.). One of the Seven Wise Men of Greece. He was born at Mytilene in the island of Lesbos and was a son of Hyrrhadus, a Thracian, and a Mytilenean mother of good family. He is celebrated as a soldier, statesman, philosopher, and poet. About 612 B.C., in conjunction with the brothers of the poet Alcæus (q.v.), he overthrew and killed Melanchrus, the despot of Mytilene. A few years later, about 606, he was engaged, at the head of the Mytilenean forces, in fighting the Athenians for the possession of the coast of the Troad near Sigeum. Though neither side was decisively victorious, Pittacus slew with his own hand the Athenian commander Phryno. For his services he would take but a small piece of land, which he dedicated to sacred uses; at a later time it was known as the Pittacean Land. On the banishment of Alcæus, who was the leader of the aristocratic party, Pittacus, as being the most prominent democrat in the city, was in 589 chosen *asymnetes* (ἀσυνμήτης), or ruler with absolute power, for 10 years. As dictator he reestablished security and peace in the state and enacted various laws. Of his poetry only a few lines have been preserved by Diogenes Laertius (q.v.).

PITT DIAMOND. A famous stone, originally weighing 410 carats, now reduced to 136¾ carats, and considered the most brilliant and perfect diamond in existence, being valued at nearly \$2,500,000. It was found in the Partael mines of India, and was sold for about \$100,000 by a sailor to Thomas Pitt, Governor of Fort St. George and grandfather of the first Earl of Chatham. In 1717 it was sold to the Duke of Orleans and hence received the name of the Regent diamond. One account says the Duke paid \$400,000, another that the price paid was \$675,000. At the time of the French Revolution it was pledged in the hands of a Berlin merchant; and was afterward set in the hilt of Napoleon's sword. It is now owned by the French government. See Plate of DIAMONDS.

PITTI PALACE. A celebrated Florentine palace of the early Renaissance, now used as a royal residence. Excepting the Vatican it is the largest palace in Italy, and one of the most imposing in the world. A typical Florentine palace of the fifteenth century, part fortress, part residence, it became a model for such structures. The imposing character of the façade is due to the use of rough-hewn stone, giving a massive effect, and to the simple and harmonious proportions of the three stories. This effect is heightened by its situation upon a hill on the left bank of the Arno; behind it are the beautiful Boboli Gardens.

The palace was designed in 1440 by Brunelleschi for Luca Pitti, then chief magistrate of the Republic. Brunelleschi lived to complete the first story, and after Luca's fall the building was not resumed until the palace was purchased by the ducal family and made their residence. In 1568 Ammanati was employed to make a new design to replace Brunelleschi's lost plan. To him is due the celebrated court of the palace—a rather unfortunate attempt to use rustic work with pilasters. The wings of the façade date from 1620, being an addition to Brunelleschi's more simple plan, and the building was not completed till 1839.

Within the palace, and open to the general public, is one of the finest collections of paintings in the world, numbering but 500 specimens, nearly all of them masterpieces. It is especially rich in Italian masters of the sixteenth century, and possesses fine examples by Andrea del Sarto, Giorgione, Titian, Tintoretto, besides six of the very best Raphaels, including the world-famous Madonnas of the Grand Duke and of the Chair and the portraits of Julius I and Leo X. Other European schools are represented by Dürer, Rembrandt, Rubens, Van Dyck, Murillo, and Velazquez. Consult J. de W. Addison, *Art of the Pitti Palace* (Boston, 1904), and Corrado Ricci, *Les musées de Florence: Palais Pitti et Académie* (Paris, 1911).

PITTMAN, KEY (1872–). An American legislator, born at Vicksburg, Miss. He studied at the Southwestern Presbyterian University at Clarksville, Tenn., and began law practice at Seattle, Wash., in 1892. Five years later he went to Klondike, where he worked as a miner for two years, participated in the attack on the corruption of government officials, and helped (1899) to organize the government in the Nome district. In 1902 he moved to Tonopah, Nev., where he acquired an extensive mining and corporation practice. He was unsuccessful as Democratic candidate for United States Senator in 1910, but was elected by popular vote to that office in 1912, his election being confirmed by the Nevada Legislature for the unexpired term of George S. Nixon ending in 1917.

PITTON DE TOURNEFORT, JOSEPH. See TOURNEFORT, J. P. DE.

PITT-RIVERS, AUGUSTUS HENRY LANE-FOX (1827–1900). An English archaeologist. His name originally Lane-Fox, he assumed that of Pitt-Rivers in 1880 upon inheriting the estates of his great-uncle George Pitt, second Baron Rivers. He studied at the Sandhurst Military College, received a commission in 1845, and was subsequently promoted through the various grades to lieutenant general in 1882. An extensive collection of weapons and instruments which he made to illustrate the course of human invention, he presented to the University of Ox-

ford. Pitt-Rivers made extensive excavations on his own estate, which was the site of battlefields of the Britons, the Romans, and the Saxons. In 1876 he became a fellow of the Royal Society and in 1881–82 was president of the Anthropological Institute. He is author of *Excavations in Cranborne Chase* (2 vols., 1887–88); *Antique Works of Art from Benin* (1900); *Evolution of Culture and Other Essays* (1906).

PITTSBURG. A city in Crawford Co., Kans., 129 miles by rail south of Kansas City, on the Atchison, Topeka, and Santa Fe, the Missouri Pacific, the St. Louis and San Francisco, the Joplin and Pittsburg, and the Kansas City Southern railroads (Map: Kansas, H 8). It has extensive coal-mining interests, being situated in the centre of productive coal fields. There are shops of the Kansas City Southern, a foundry and machine shops, brick and sewer-pipe plants, lumber and flour mills, clay works, grain elevators, packing houses, etc. The city maintains a public library. A State normal manual training school is situated here. Settled in 1876, Pittsburg was incorporated in 1880. It has the commission form of government. The water works are owned by the city. Pop., 1900, 10,112; 1910, 14,755; 1915 (U. S. est.), 17,320.

PITTSBURGH. The county seat of Allegheny Co., Pa., situated at the confluence of the Allegheny and Monongahela rivers, which unite within the city limits to form the Ohio; 444 miles by rail west of New York, 354 miles west-northwest of Philadelphia, and 468 miles east of Chicago (Map: Pennsylvania, A 6).

The census returns of 1910 rank Pittsburgh eighth in population and fifth in commercial and industrial importance among the cities of the United States and second to Philadelphia in the State. Pittsburgh in 1915 had 27 wards, their total area aggregating 41.61 square miles. The original city lay in the peninsula formed by the two rivers. Its corporate limits spread eastwardly, resulting in separate annexations in 1837, 1847, 1868, 1874, 1895, and 1906. Twelve boroughs, in line on the south side of the Monongahela, were annexed in 1874 and the city of Allegheny (q.v.) in 1906. Many of the great industries have been established on the outskirts of the city for convenience of space and rail and river shipping facilities. The city has been growing out to them. A new residential section has grown on the South Hills, made feasible by tunnels through Mount Washington. The city owns four bridges across the Monongahela and in 1915 built a magnificent bridge across the Allegheny at the Point. Eight other bridges cross the Allegheny, but they are owned by the county.

Coal is still the main fuel for manufacturing purposes, but the abundance of natural gas, also largely used in manufacturing and the principal fuel of the homes, has made Pittsburgh a comparatively clean city except under certain atmospheric conditions. The unattractive characteristics of a manufacturing city have been slowly disappearing, and vast civic improvements have been made, especially in the cutting down of the heavy grades of important streets necessitating the razing of many blocks of old buildings and the erection of modern and attractive ones in their stead. The elevation of many streets above the flood level of the Allegheny River, the opening of the Schenley Farms for building purposes, bridges across the ravines, tunnels through the South Hills, a system of well-kept parks, new

and costly public buildings, hotels, and private residences, have all combined to make Pittsburgh a distinctly modern American city. The narrow, poorly planned streets of colonial Pittsburgh remain. Diamond Street and Oliver Avenue are the new thoroughfares. Fifth and Sixth avenues, Sixth Street (also called Federal), Wood, Market, and Smithfield streets are the principal thoroughfares. Lower Liberty Street and Penn Avenue have become streets of retail stores. Fourth Avenue continues the local Wall Street. The Bellefield, Shadyside, East Liberty, Homewood, and Squirrel Hill districts contain the most costly residences. These are found on the eastern portions of Fifth and Penn avenues, Forbes and Liberty streets, the chief thoroughfares between downtown and the East End, and on Highland, Negley, Ellsworth, and Centre avenues. The altitude of the city varies from 703 feet above sea level, at the confluence of the rivers, to 1260 feet at Herron Hill. The mean annual temperature is 53° F., 31° F. for January and 75° F. for July.

The city has 983 miles of streets, of which 542 are paved. The city's three boulevards, united, are 11½ miles long. There are 630 miles of sewer, 731 miles of water mains, and 8 reservoirs, with an aggregate capacity of 585,000,000 gallons. An extensive filtration plant (slow sand system) has been installed at Aspinwall on the Allegheny River at a cost of about \$7,000,000. The plant covers 167 acres, the sand beds 56 acres, and it has a capacity of 200,000,000 gallons daily. The entire city and suburbs are piped for natural-gas consumption, which is not only the principal domestic fuel, but has almost entirely supplanted artificial gas for light. The electric-railway system, embracing the entire city and extending to the suburbs, has a total single-track mileage of about 513, of which 208 are within the city limits.

Buildings. Among the prominent public buildings are the Allegheny Courthouse and jail, completed in 1888, occupying two blocks, facing Grant Street, with a "Bridge of Sighs" across Ross Street. An additional courthouse was being erected in 1915 on the opposite block, between Diamond Street and Fourth Avenue, at an estimated cost of \$5,000,000. In the imposing government building on Smithfield Street are the quarters of the United States courts, the collector of internal revenue, surveyor of the port, and other Federal officials. Among the many office buildings the most notable are the Henry W. Oliver (25 stories), the First National Bank (25 stories), and the Keenan (20 stories) buildings, and the Frick Arcade. The handsome Frick Building opposite the courthouse is of granite, finished throughout in white marble and mahogany. The Farmer's Deposit National Bank Building has 24 stories. There are a score or more buildings of the sky-scraper type. The Bank of Pittsburgh has an artistic home of the low type. Notable church structures are the new St. Paul's Cathedral (Roman Catholic) in Bellefield, Trinity (Protestant Episcopal), "downtown," Christ Methodist Episcopal and the Sixth United Presbyterian, "East End," St. Augustine's (Roman Catholic) in Lawrenceville, and the new synagogue of the Rodeph Shalom congregation in Oakland. The finest hotels are the new William Penn (21 stories), Fort Pitt, Schenley, and the Colonial Annex. The opening of the Schenley-estate holdings in Bellefield, known as the Schenley Farms, has given Pittsburgh a section

unique in topography and noteworthy for the character and magnificence of its architecture. Chief among the buildings on this plot are those of the University of Pittsburgh, the Soldier's Memorial of Allegheny County, the Masonic Temple, Syria Temple of the Nobles of the Mystic Shrine, the Eighteenth Regiment (National Guard) Armory, and the Pittsburgh Athletic Club.

Parks. The system of parks originated in Pittsburgh in 1890, when Mrs. Mary E. Schenley, of London, England, a native of Pittsburgh, deeded to the city 382 of her ancestral acres in the Bellefield section for the park named in her honor. Additions of 40 acres have since been made. The Carnegie Museum and Library is at the Forbes Street entrance. The park contains the Phipps Conservatory and Hall of Botany (gifts of Henry Phipps), a music pavilion, several fine bridges, bronze statues of E. M. Bigelow (termed "the Father of the Parks") and Robert Burns and a statue of Col. A. L. Hawkins, bronze memorial tablets of the Tenth Regiment (Pennsylvania) Volunteers in the Spanish-American War, a race track, and five shelter houses. Highland Park (area, 366 acres), on the high ground at the head of Highland Avenue overlooking the Allegheny River, is one of the most picturesque parks in the country. It contains three city reservoirs, several statues (the most notable that of Stephen C. Foster), the C. C. Magee Zoölogical Gardens, three shelter houses, and a band stand. The principal entrances, at Highland and Stanton avenues, are graced by handsome sculptures. There are also beautiful parks on the North Side. (See ALLEGHENY.) The William Pitt Boulevard connects Highland and Schenley parks and the Grant Boulevard, the latter with the downtown district. There are a number of smaller parks throughout the city, Arsenal, Herron Hill, Grandview, Lawrence, McKinley, and West End are the principal: McKinley the largest, with 63 acres. There are several plots for playground purposes, fully equipped, notably the Washington Grounds on the hill above the Pennsylvania Station. There are lakes in Schenley, Highland, and the West parks; golf links in Schenley, free merry-go-rounds in Schenley, Grandview, and Riverview parks, and a gymnasium and ball grounds in Washington and Lawrence parks. The total park acreage is 1328.89.

Public Institutions. Chief among the public institutions of the city are the magnificent buildings of the Carnegie Foundations, comprising the Carnegie Library and Institute. The institute has three branches—the Museum of Art, the Museum of Science, and the Carnegie Institute of Technology (q.v.). The museums are housed in the Central Library Building at Schenley Park. This building covers nearly six acres, is of the Italian Renaissance type, and was opened to the public in 1895. In 1907 it was remodeled and enlarged and has cost \$6,000,000. The endowment of the institute is \$12,264,000. The city appropriates approximately \$250,000 annually for the maintenance of the Central Library and its eight branches. Carnegie Free Library of Allegheny is a separate foundation, for which Pittsburgh makes an annual appropriation. The Central Library contains 275,202 volumes; the circulation in 1914 was 204,596. The branches contain 143,947 volumes, with a total circulation, in 1914, of 1,351,731. The Central Library Building contains a music hall,

seating 2000, where free organ recitals are given weekly, and art galleries where an international exhibition of art is held by the Carnegie Institute. Allegheny County's Soldiers Memorial known locally as Memorial Hall, one of Pittsburgh's most notable structures, was completed in 1910, at a cost to the county of \$1,700,000. It contains an auditorium, seating 2600, and a banquet room. A museum of pictures and manuscript war relics and a war library have been established. Bronze mural tablets have been erected containing the names of 20,000 soldiers and sailors furnished by Allegheny County during the Civil War. The Pittsburgh Exposition Society holds a general exposition for six weeks each autumn in its buildings on Duquesne Way, at the Point.

Hospitals and Charities. Pittsburgh has 21 hospitals and 80 charities. The largest general hospital is the Western Pennsylvania, on Friendship Avenue, the department for the insane being at Dixmont. Other hospitals are the new Homœopathic, new Elizabeth Steel Magee, St. Margaret's Memorial, St. Francis, Columbia, Mercy, Passavant's, Montefiore, Eye, Ear, and Throat, Pittsburgh, South Side, and St. Joseph's. (See ALLEGHENY.) All receive State aid except St. Margaret's and the Magee. There are also the Municipal, Municipal Tuberculosis, and the United States Marine hospitals. Among the charitable institutions are the Church Home (Protestant Episcopal), Home for Incurables, Florence Crittenton Home, Free Dispensary, St. Joseph's Protectory for Boys (Roman Catholic), Home for the Aged (Roman Catholic), St. Paul's Orphan Asylum (Roman Catholic) at Idlewood, Old Ladies' Home (United Presbyterian) at Wilkinsburg, Odd Fellows' Home for Widows and Orphans at Ben Avon, Pittsburgh Newsboys' Home and the Home of the Ladies of the Grand Army of the Republic at Hawkins. The principal cemeteries are the Allegheny, Homewood, Uniondale, and South Side (Protestant), and St. Mary's and Calvary (Roman Catholic). The smaller burying grounds are many; one of the most interesting that about Trinity Church, Sixth Avenue, where many pioneers of the community were interred, among them 24 officers of the Revolution, whose names are commemorated on a bronze tablet on the Oliver Avenue wall. Two fine settlement houses, the Sarah Heinz and the Irene Kaufman, are memorials of the wives of prominent citizens. Two tuberculosis dispensaries are maintained—one by the State, the other by private charity. The United States Bureau of Mines in 1912 established a rescue station in Pittsburgh.

Educational Institutions. Pittsburgh has a well-equipped educational system. There are 118 elementary schools, 1 normal school, and 7 high schools. In 1915 there were 2700 teachers and principals. Four new high schools and five elementary buildings were under construction in that year. The total enrollment of pupils in 1915 was 76,989. Fifty-four night schools are also maintained, with a total enrollment of 23,277 and 340 teachers. The control of the public schools is vested in a board of 15 directors, appointed by the judges of the courts of common pleas of Allegheny County for a term of five years. The appointed board makes but one tax levy, regulates all courses of study, and has entire control. Ninety-seven kindergartens are maintained, with 202 teachers and an enrollment of 6414. To the total of the school population

must be added approximately 27,000 in the parochial schools. The private educational institutions include the University of Pittsburgh (q.v.), formerly the Western University of Pennsylvania; Duquesne University, formerly the Pittsburgh College of the Holy Ghost (Roman Catholic); the Carnegie Institute of Technology (q.v.); Pennsylvania College for Women; Dilworth Hall; Academy of Our Lady of Mercy and Ursuline Academy (Roman Catholic), for girls; Shadyside and East Liberty academies, for boys; Pittsburgh Academy (coeducational); the Kindergarten College; and numerous institutes. The Duquesne University maintains departments of law and engineering. The Institution for the Blind is in Bellefield and the Institution for the Deaf and Dumb at Edgewood, a suburb.

Commerce and Industry. Pittsburgh is a port of entry, and its imports for the year ending June 30, 1915, amounted to \$1,935,703. Pittsburgh is the centre of the largest manufacturing district for steel and iron in the world. Within a radius slightly larger than that of the metropolitan district tin plate, steel cars, pipe and tubing, air brakes, coal and coke, electrical machinery, glass, pickles, white lead, and vanadium are produced on a large scale. The city's supremacy is due to its fuel supply. Coal and coke are the largest items in its enormous freight tonnage, which surpasses that of New York and is unequalled. The coal tonnage in the Pittsburgh district in 1913 was 101,000,000 tons. The railroad freight of all kinds totaled 160,444,634 tons, excluding switching and local tonnage; the water tonnage was 12,184,494 tons. The Pittsburgh district is not only the largest coal-producing district in the world, but the largest coal-consuming district as well. In 1913, a record year, 33,000,000 tons were made into coke, totaling 20,097,900 tons, and 13,495,473 tons were shipped as lake cargoes.

In 1910 the Pittsburgh metropolitan district (see section on *Population* below) had invested in manufacturing enterprises \$642,527,046, with annual products worth \$578,815,493. In the city of Pittsburgh the census of 1910 gives the number of manufacturing establishments as 1659; capital, \$283,130,000; value of manufactures, \$243,454,000; wage earners, 67,474; wages, \$39,973,000. The invested capital and output of adjoining cities and towns outside of the metropolitan district, with the district called "the greater Pittsburgh," added to this total, greatly increases these amounts. This district in 1910 produced 10,001,099 tons of pig iron, or 16 per cent of the world's output, and 30.5 per cent of the production of the United States. The city and metropolitan district produced, in 1912, 6,107,128 tons of pig iron, nearly 20 per cent of the United States output. The production of steel of all kinds in the Pittsburgh district in 1912 was 11,199,430 tons, or 36 per cent of the output of the country, 25 per cent produced in Allegheny County. Steel rails approximated 12 per cent and structural steel 37 per cent. Other finished products are wire, nails, boiler, hull, and armor plate, projectiles, angle and merchant iron, agricultural implements, stoves, engines, boilers, locomotives, sanitary supplies, and enameled ware. The diversified manufacturing, apart from the predominating industries, is vast and important. The value of the glass products in 1912 was \$39,491,000. Pittsburgh has the largest cork factory in the world. Pittsburgh

is also important in the production of finished aluminium and electrical cable for underground use. It has an annual output of over 500,000 pounds of copper. The value of these diversified industries aside from iron, steel, glass, and their correlated products, and electrical equipment reaches \$125,000,000. Peculiarly local is the manufacture of the so-called tobies or stogies. This species of cigar originated in Pittsburgh, and there are 250 manufactories in the city engaged in this business, whose annual product totals \$4,000,000.

In 1910 the census enumerated 2369 manufacturing establishments in the metropolitan district, with 20,692 salaried employees and 139,285 wage earners (average number). The United States Steel Corporation has a number of its constituent plants in Pittsburgh. The Westinghouse Air Brake Company's works, employing 3500 hands, are at Wilkferding, a suburb, and the Westinghouse Electric Company's with 13,000 at East Pittsburgh. The three steel-car plants employ 13,000. There are over 40 plants employing over 1000 hands each.

There are 22 national banks, 26 State banks, and 30 trust companies in Pittsburgh, with combined capital of \$55,626,300; surplus and undivided profits, \$95,956,634; deposits, \$430,646,460. Of these one trust company has a capital of \$1,500,000; surplus and profits, \$32,823,233; and deposits of \$58,946,515. One national bank has deposits of \$51,508,057. Most of these institutions are represented in the Pittsburgh Clearing House. The Clearing House Association is composed of 15 national banks in the city; the annual clearings total nearly \$3,000,000,000.

Transportation facilities of Pittsburgh consist of water routes of the three rivers, and 22 railroads, comprising the Pennsylvania System, New York Central lines, Baltimore and Ohio, Bessemer, the Buffalo, Rochester, and Pittsburgh, and the Wabash railroads. The most extensive freight yards are the Pitcairn on the Pennsylvania Railroad, Glenwood on the Baltimore and Ohio, McKees Rocks on the Pittsburgh and Lake Erie; Sheridan, for the Pan Handle lines; Conway, for the other Pennsylvania lines west. At Twenty-eighth Street are the yards of the Buffalo and Allegheny Valley Division, and on the North Side those of the Conemaugh and West Penn divisions. The Wabash yards are at Rook, 4 miles out. The Pennsylvania has a large passenger station at Liberty and Eleventh streets, used by all its lines. The station on the North Side, formerly Allegheny, is now called the Federal Street Station. The Baltimore and Ohio has its station at Water and Smithfield streets, used also by the Buffalo, Rochester, and Pittsburgh. The Pittsburgh and Lake Erie has a fine station at the south end of the Smithfield Street Bridge, and the Wabash an elaborate structure at Liberty and Ferry streets.

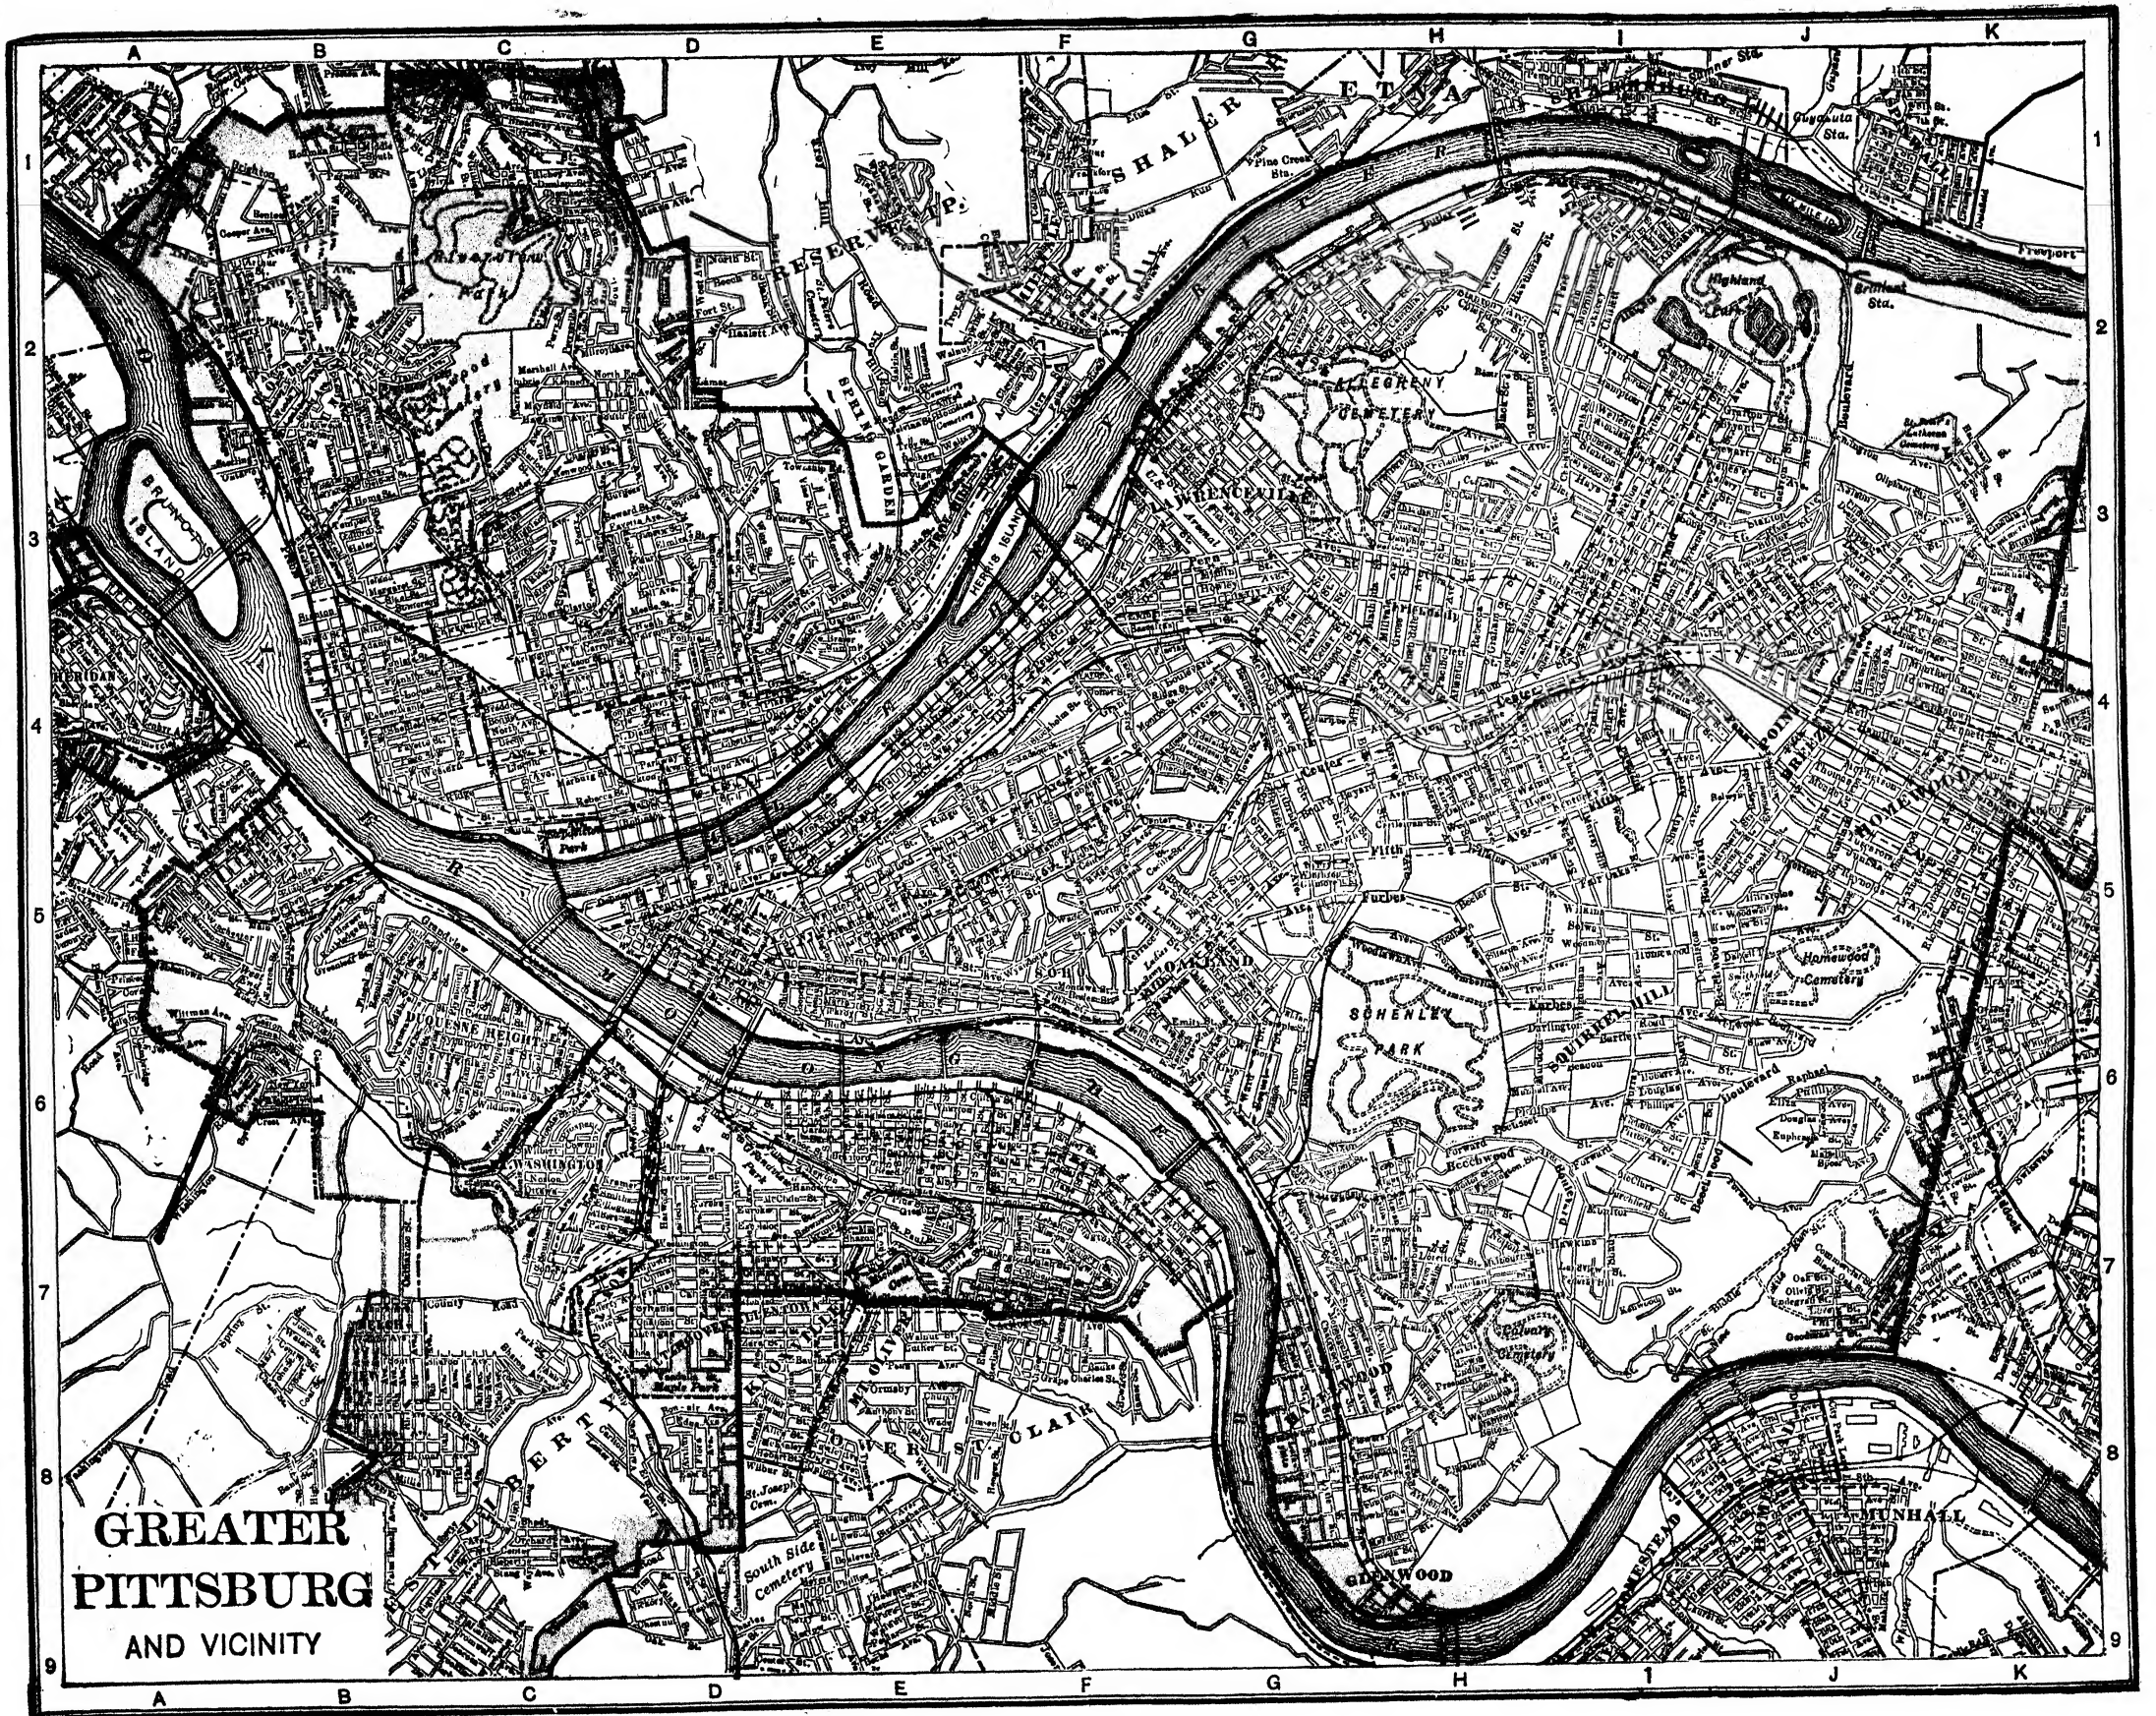

The rivers are of great importance commercially. The Monongahela (q.v.) flows north through the richest coal fields of West Virginia and southwest Pennsylvania. On its banks are many of the largest manufacturing plants of the Pittsburgh district, including those at Monessen, McKeesport, Clairton, Duquesne, Braddock, and Homestead. The Monongahela is a "slack-watered" river, with 15 locks and dams built and operated by the United States government, without tolls. The Davis Island Dam, the first of the Ohio River improvements, 5 miles below the confluence, in connection with the first dam on the

Allegheny and Number 1 on the Monongahela, forms the Pittsburgh Harbor, a Y-shaped pool nearly 7 miles long. Pittsburgh has 244 steam vessels on its marine register, their total tonnage being 33,712. The total barge tonnage is estimated in excess of 2,500,000 tons. Steamboat traffic is maintained on the Ohio River, and considerable business in lighter freights and passengers is done by packets. Such traffic on the Monongahela and rafting on the Allegheny have been discontinued.

The export trade of Pittsburgh is vast. Many manufactured products are shipped by river. Coal shipped to tidewater is mainly from mines 20 miles east of the city. Coal not available for river shipments goes west and northwest by rail to the lakes. Eight lake ports can be used, all in direct railroad communications with Pittsburgh, Ashtabula being the chief. The export tonnage in manufactured iron and steel is enormous.

Government. The government of Pittsburgh is operated under a charter (granted in 1901 and amended in 1909 and 1911) which makes the mayor the chief executive. A council of nine members legislates for the city. The mayor is elected on a nonpartisan ballot for a term of four years. He appoints all heads of departments, subject to the approval of a majority of the council. The controller is elected on a nonpartisan ballot for a term of four years. The treasurer is appointed by the mayor for the same term. The chief departments are public safety, public works, health, and public charities. Other departments are law, city treasurer, supplies, assessors, and city planning. There are eight police magistrates, appointed by the mayor, and a board of three members, likewise appointed, for the assessment of water taxes. The department of city planning is directed by an unsalaried commission of nine, appointed by the mayor, which is empowered to prepare plans, reports, and recommendations for public improvements, and to make suggestions or reports on any public improvement submitted to council. The art commission consists of the mayor, director of the department of public works, and seven others appointed by the mayor. Attached to the mayor's office are several bureaus. Police and detectives are under one head, the chief of police. The bureau of fire is under the chief engineer, who has 10 assistants. The apparatus is largely automobile in character. There were, in 1915, 62 fire companies and a water tower. The civil-service law for Pittsburgh, passed by the Legislature of Pennsylvania, is administered by a salaried board of three persons appointed by the mayor, whose term of office runs with the mayor. The law provides that not more than two members shall be adherents of the same political party. An independent fund for school teachers is under the control of the board of education.

Municipal Finances. The total assessed valuation of the city for 1915 was \$771,000,000. The gross bonded indebtedness is \$39,063,606; net debt, \$30,558,129. The limit of indebtedness fixed by law is 7 per cent of the assessed valuation. The real estate owned by the city includes the water plants, land and improvements, \$18,952,960; fire properties, \$1,545,269; police properties, \$349,546. The grand total of all buildings is \$37,212,492. The total revenues for the fiscal year ending Jan. 31, 1915, were \$16,206,952.70; total appropriated for general ex-

penditures, \$12,554,916.62. The department of public works expended \$419,694.83. The department of public safety expended \$2,089,273.45 in the two bureaus of police and fire, divided almost equally. The department of charities expended \$348,350.33. Interest paid amounted to \$1,884,819.74, and \$1,336,644.13 was applied to sinking funds. The health departments expended \$721,446.16. A system of health inspection in the schools has been established. This is called the department of child welfare. The value of school grounds is \$5,786,806.05; of school buildings, \$11,432,690.92, equipment, \$1,067,133.88.

Population. The growth of Pittsburgh and its metropolitan district has been rapid. As defined by the United States Bureau of the Census, the metropolitan district of Pittsburgh includes McKeesport, Braddock, Wilkinsburg, Homestead, Duquesne, and 20 other boroughs, all of which are communities which may be considered as intimately associated with the urban centre. In 1910 the population of the metropolitan district was 1,042,855; of Allegheny County, 1,018,463. The population of the city of Pittsburgh by periods is: 1800, 1565; 1810, 4768; 1820, 7284; 1830, 12,568; 1840, 21,115; 1850, 46,601; 1860, 49,221; 1870, 59,568; 1880, 121,799; 1890, 238,617; 1900, 321,616; 1910, 533,905; 1915 (U. S. est.), 571,984. In 1910, 393,469 were native born, 140,436 foreign born, and 191,483 of foreign or mixed parentage. The great industries of the Pittsburgh district draw this large alien population. The colored population in 1910 was 34,217.

History. Traders in Indian goods came into the upper Ohio region about 1730, and in a few years the headwaters of the Ohio became a centre of their trading operations. France and Great Britain were rival claimants to the region, and on the British side both Pennsylvania and Virginia asserted jurisdiction. Washington visited the site of Pittsburgh in 1753 and wrote in his journal: "I spent some time in viewing the rivers and land in the forks, which I think extremely well situated for a fort, as it has absolute command of both rivers." In the interest of the Ohio Company (q.v.), Captain Trent with a few Virginia militia began a fort at "the Forks" in February, 1754. This detachment was surprised (April 17) by a force of 1000 French and Indians with artillery, who compelled the Virginians to leave. The French then built Fort Duquesne. In the effort to capture this fort the strong British expedition under General Braddock met disastrous defeat (July 9, 1755), 8 miles distant, at the present town of Braddock. In 1758 General Forbes, moving from Philadelphia, led an army of 7000 against Fort Duquesne. An advance party of 800 under Major Grant attempted to surprise the garrison on September 14, but was overwhelmed and routed. The site of this engagement is marked by a bronze tablet on the courthouse. The historic hill for a century known as Grant's Hill has been gradually cut away. Forbes by November 24 was within 15 miles of the fort; the weak garrison thereupon burned the buildings, blew up the fort, and fled down the Ohio in boats. The next day Forbes occupied the place and named it Pittsburgh in honor of the British Prime Minister. A detachment under Col. Hugh Mercer built a small fort, called Fort Pitt, and garrisoned it during the winter. In 1759 General Stanwix built the second Fort Pitt, which remained until 1792. During Pontiac's

War Fort Pitt was vigorously besieged by the Indians from June 27 to Aug. 6, 1763. Colonel Bouquet, with 500 British regulars and 200 frontiersmen, marched from Carlisle to its relief and defeated the Indians, reaching the fort August 9. In 1764 he erected the small brick blockhouse within the fort's outer walls which still stands, the only structure of Colonial times in Pittsburgh and the last vestige of British rule in western Pennsylvania. It was deeded to the local chapter of the Daughters of the American Revolution by Mrs. Schenley and is maintained by them. A special act of the Legislature insures its preservation.

In 1764 John Campbell laid out a small plan of lots near the fort, known as the "military plan," and still referred to. The Indian claim to most of the country about Pittsburgh was extinguished in a treaty made with the Iroquois in 1768 at Fort Stanwix. All remaining Indian lands in Pennsylvania were purchased by the State in 1784. In January, 1769, the Penns surveyed the Manor of Pittsburgh, containing 5766 acres, and opened a land office for the sale of lots. Emigration set in so strongly, however, from Virginia that Virginia influence predominated, and that Colony obtained control. Washington visited Pittsburgh again in 1770 and wrote: "The houses, which are built of logs, and ranged in streets, are on the Monongahela, and I suppose may be about 20 in number, and inhabited by Indian traders." In 1772 Fort Pitt was evacuated by the British, but in 1774 was occupied and repaired by Virginia militia, and Virginia authority was established and maintained by force of arms. Virginia governed the country until the boundary dispute was settled in 1781. During the Revolution Fort Pitt was garrisoned by Continental troops. The Penns, after the confiscation of their estates, being allowed to retain their manors, began a new sale of lots in Pittsburgh in 1784, and a survey was made which became the plan of the original borough. Arthur Lee described the town that year in scathful terms and predicted, "The place, I believe, will never be very considerable." Allegheny County was erected in 1788, and the county seat was established at Pittsburgh. The opening of the Northwest Territory, and the steady emigration via the river to Kentucky, gave Pittsburgh's trade a great impetus, but the real growth did not begin until after Wayne's defeat of the Indians and the close of the Indian hostilities in 1795. The first newspaper west of the Alleghenies, the "Pittsburgh Gazette," was established July 29, 1786. Pittsburgh was created a borough in 1794. That year the disturbances known as the Whisky Insurrection culminated and involved Pittsburgh actively. The first steamboat on the Western rivers was launched at Pittsburgh in 1811. Pittsburgh became a city in 1816. The manufacture of window glass began in 1797, and in the decade following shipyards, foundries, cotton factories, and shops for metal working were established. The first bank was established in 1804. The Pennsylvania Canal was constructed into the city in 1834. An era of prosperity followed, checked somewhat by the disastrous fire of April 10, 1845, which destroyed property valued at \$6,000,000. The first railroad entered the city in 1851. In 1877 the great railroad strikes, which prevailed throughout the country, affected Pittsburgh early, and on July 21 and 22 property valued at \$3,000,000 was destroyed by mob

violence. During those two days 27 persons were killed. Order was restored on July 23.

PITTSBURGH, UNIVERSITY OF. A coeducational institution for higher education, which succeeded the Western University of Pennsylvania, incorporated in 1813 at Allegheny. This institution in turn was the successor to the Pittsburgh Academy, which was founded in 1786 and incorporated in 1807. In 1908 the name was changed to the University of Pittsburgh, and the institution was removed to its new campus of 43 acres at Schenley Farms, in Pittsburgh. The organization of the college includes the college department, comprising the college, the school of education, and the school of economics; the technical department, comprising the school of engineering and the school of mines; the professional department, comprising the schools of medicine, law, dentistry, and pharmacy; and the graduate department, comprising the graduate school, the observatory, and the Mellon Institute of Industrial Research. The total enrollment in all departments in 1914-15 was 3523, and the instructors numbered 340. The endowment funds amount to \$525,000, and the annual income amounts to about \$496,000. The library contains about 40,000 volumes. The chancellor in 1915 was Samuel Black McCormick, D.D., LL.D.

PITTSBURG LANDING, BATTLE OF. See SHILOH, BATTLE OF.

PITTSFIELD. A town in Somerset Co., Me., 20 miles northeast of Waterville, on the Sebasticook River and on the Maine Central Railroad (Map: Maine, C 4). It contains the Maine Central Institute and a public library. There are woolen mills, a creamery, packing houses, and lumber and shoddy mills, for which the river furnishes excellent power. Pop., 1900, 2891; 1910, 2891.

PITTSFIELD. A city, including several villages within its corporate limits, and the county seat of Berkshire Co., Mass., 150 miles west of Boston, on the Boston and Albany and the New York, New Haven, and Hartford railroads; the centre of an extensive street-railway system connecting Berkshire points (Map: Massachusetts, A 3). Its site in a hill-girt valley of the Berkshires, among lakes, over 1000 feet above sea level, is of great natural beauty. One of the public parks has the fine statue of "The Color Bearer." The city occupies 41 square miles and has 150 miles of streets. Among noteworthy structures are the courthouse, built

of white marble, the Crane Museum of Natural History and Art, the Berkshire Athenæum, the latter containing a public library of 70,000 volumes, the House of Mercy and Hillcrest hospitals, tuberculosis hospital, Y. M. C. A., the Henry W. Bishop Training School for Nurses, the Berkshire County Home for Aged Women, the high school, the Berkshire Life Insurance Building, the Agricultural National Bank, and the Berkshire County Savings Bank. Situated in the heart of the famous Berkshire Hills, Pittsfield is an attractive residential place and a popular summer resort. It is known also for its manufacturing interests. According to the census of 1909, \$15,080,000 was invested in the various industries, which had a production valued at \$15,215,000 and gave employment to 7414 persons. The leading establishments are woolen mills, a silk mill, foundries and machine shops, electrical machinery and supply works, manufactories of underwear, thread and braid, stationery, clothing, and paper-making machinery, paper mills, a piano factory, etc.

The government, under a charter of 1895, is conducted by a mayor, chosen annually, and a bicameral council that elects most of the administrative officers. The school committee is chosen by popular vote. The mayor appoints license commissioners. The water works, valued at more than \$2,000,000, are owned and operated by the municipality. Settled in 1743 as Ponttosuck, or Boston Plantation, Pittsfield was incorporated as a town under its present name in 1761 and in 1891 was chartered as a city. Longfellow stayed for a time at the Appleton House here. Oliver Wendell Holmes and Herman Melville lived near by. Pop., 1900, 21,766; 1910, 32,121; 1915 (State census), 39,301. Consult J. E. A. Smith, *The History of Pittsfield* (Springfield, 1876).

PITTSTON. A city in Luzerne Co., Pa., 9 miles southwest of Scranton, on the Susquehanna River, below the mouth of the Lackawanna, and on the Lehigh Valley, the Lackawanna and Wyoming Valley, the Central of New Jersey, the Delaware and Hudson, the Lackawanna, and the Erie railroads (Map: Pennsylvania, K 3). Situated in the anthracite region of the State, it is engaged principally in mining and preparing coal for market, the city being the headquarters of two State inspection districts, with 72 mines producing nearly 10,000,000 tons annually. The manufacturing establishments include foundries and machine shops, stove works, knitting mills, paper, silk, and woodworking mills, breweries, terracotta and cut-glass works, brickworks, etc. Pittston is one of the leading commercial and industrial centres of this region. The borough of West Pittston (q.v.), across the river, and connected by three bridges, is more distinctly a residential place. The city maintains a hospital and a fine high school. Laid out in 1768 and named in honor of William Pitt, Pittston was settled about 1770, was incorporated as a borough in 1855, and was chartered as a city in 1894. It has adopted the commission form of government. Pop., 1900, 12,556; 1910, 16,267; 1914 (U. S. est.), 17,847.

PITUITARY BODY (Lat. *pituitarius*, relating to phlegm, from *pituita*, phlegm; connected with *spuere*, Gk. *πρῆνναι*, *ptyein*, Lith. *spiauti*, Lett. *splaut*, OChurch Slav. *plivati*, *plynti*, Goth. *speiwan*, OHG. *spāvan*, Ger. *speien*, AS. *spīwan*, Eng. *spew*, and ultimately with

Eng. *spit*). The hypophysis of the brain, often called the pituitary gland, is an appendage of the lower side of the twist-brain in vertebrates. It occupies the pituitary fossa, or sella turcica, a bony depression in the sphenoid bone at the base of the skull. In size it averages $10 \times 12 \times 7$ millimeters, weighs six grams, and is divided into two lobes, anterior and posterior, connected by a stalk, the pars intermedia, or infundibulum. Each lobe has an entirely distinct embryonic origin. The anterior lobe is the larger and springs from the upper part of the buccal cavity (Rathke's pouch) of the embryo. In the human being this lobe is of a reddish-gray color and is made up of glandular elements. The posterior lobe is structurally continuous with the infundibulum and is a process of the brain. It occupies a depression in the anterior lobe, is smaller, paler, and is made up of connective tissue fibres, nerve cells, and eosinophile cells. The infundibulum is partly glandular, partly vascular in structure. In the lower vertebrates both it and the posterior lobe are clearly made up of nerve tissue, but in the higher animals this lobe is almost destitute of nerve substance. The physiology of the body is complex and still unsettled, and it has been the subject of lively investigation during late years. It seems evident that the pituitary and thyroid glands have a reciprocal, complementary, or compensatory relation in their influence on nutrition and growth. For example, in many cases of cretinism and myxoedema (qq.v.) in which there is functional atrophy of the thyroid, an enlargement of the pituitary body is often observed, as well as in cases where the thyroid has been surgically ablated. Destruction or disease of the pituitary, on the other hand, commonly (but not invariably) accompanies acromegaly (q.v.). Experimental removal of the gland results in cachexia and death. The hypophysis is now regarded as a ductless gland having an internal secretion. In the form of an extract it has been given empirically without, however, yielding reliable data. An extract of the infundibulum has been found to raise the blood pressure and contract unstriated muscle fibres, and it is therefore administered in shock, intestinal paresis, and to hasten parturition. Consult Harvey Cushing, *The Pituitary Body and its Disorders* (Philadelphia, 1912). See ORGANOTHERAPY; SECRETIONS, INTERNAL; and authorities there cited.

PIT VIPER. See CROTALIDÆ.

PITYRIASIS (Neo-Lat., from Gk. *πυρρα*, *pyrra*, *pityria*, from *πυρον*, *pityron*, bran). A term applied by the older dermatologists to a group of skin affections which are characterized by a fine, branlike, scaly eruption. These diseases are now known to be pathologically dissimilar, but the term persists. *Pityriasis capitis* is seborrhœic eczema; in its dry form it is commonly known as dandruff. *Pityriasis versicolor*, or *tinea versicolor*, is characterized by the occurrence of brown or dark-yellowish patches upon the trunk, particularly those parts which are covered by clothing. It is due to a parasite, the *Microsporon furfur*. *Pityriasis infantilis* and *pityriasis senilis* are forms of eczema occurring respectively in infants and in aged persons. The typical variety of the disease is *pityriasis rubra* (of Hebra), known also as exfoliative dermatitis, in which there is a gradual dissemination of papules over the trunk and upper extremities, especially upon the dorsal as-

pect of the forearms and phalanges. The papules are bright red or slightly brownish, and are succeeded by large red spots or plaques. Changes occur in the surface of the skin, incident to the scratching which the itching provokes. A more severe form was called *pityriasis rosea* and a macular form was also described, probably identical with lichen (q.v.). Consult H. W. Stelwagon, *Treatise on Disease of the Skin* (7th ed., Philadelphia, 1914).

PITYUSÆ. The southwestern group of the Balearic Islands, consisting of the islands of Iviza and Formentera (qq.v.) and a number of small, uninhabited islets.

PI-TZŪ WO, p'ē-tsōō wō'. A small seaport on the east coast of the peninsular portion of Liaotung (q.v.). It lies north of Ta-lien-wan, has many large warehouses and considerable trade, and was included in the territory leased by Russia. The harbor is well sheltered, but is shallow. During the Russo-Japanese War (q.v.) the Second Japanese Army under General Oku was disembarked at Pi-tzū Wo in May, 1905.

PIURA, pē-ōō'rá. A northern department of Peru (Map: Peru, A 5). The area is estimated at 14,834 square miles. The eastern part is mountainous, with fertile valleys; the western is mostly desert land. Cotton is grown to some extent and some minerals are found, of which the petroleum deposits are extensively exploited. Pop. (est.), 205,300.

PIURA. The capital of the Department of Piura, Peru. It is situated 20 miles from the coast and 80 miles southeast of Cape Blanco (Map: Peru, A 4). It is a well-built town with a beautiful garden plaza containing a marble statue of Liberty. It is an important cotton market, and is connected by a railroad with the port of Paita (q.v.). Pop. (est.), 14,000. Piura was the first permanent settlement made by Pizarro.

PIUS. The name of 10 popes.—**PIUS I**, SAINT. Pope, 140-154. Little is known of his pontificate; perhaps the most authentic record of it is that contained in the Muratorian Fragment, which assigns the writing of the *Shepherd* by Hermas, his brother, to his pontificate. (See HERMAS, SHEPHERD OF.) Consult Louis Duchesne, *Histoire ancienne de l'église*, vol. i (Paris, 1906).—**PIUS II**, better known generally as Æneas Sylvius. Pope, 1458-64. He came of the noble family of Piccolomini in Siena, and was born in 1405 in the village of Corsignano, afterward called Pienza from his papal title. His early life was not free from serious irregularities, but he made amends by his subsequent decorous conduct; and his eminent abilities as a canonist led to his being employed, when but 26 years of age, as secretary to the Cardinal-Bishop of Fermo, an appointment which, though it lasted but a short time, led to further employment and brought him commissions of the highest importance in connection with the Council of Basel (q.v.). On the election of the antipope Felix V (Duke Amadeus VIII of Savoy), in 1439, he was chosen one of the deputation to notify him of his election, and became his secretary, in which post his eminent literary abilities were conspicuously useful. Having been sent as Ambassador to the Emperor Frederick III, he was induced to accept office in the Imperial Chancery. This opened the way for further steps in the diplomatic career of

which his prudence took advantage. On a mission to Rome in 1445 he declared himself decidedly for Eugenius IV and attached himself to his interests. Having at last decided to take holy orders in that year, he was made Bishop of Triest in 1447 and of Siena in 1449, remaining, however, in the Imperial service until 1455. A year later he was made Cardinal by Calixtus III. On the death of this pontiff, in 1458, after a conclave lasting only three days, Æneas Sylvius was elected his successor. As Pope he devoted himself to rousing Christendom to a war against the Turks. He called a congress of princes to meet at Mantua in 1459, and appeared in person to preside over it, but little came of it for the time. Undeterred by discouragements, he pursued his purpose, and had planned to go in person against the Turks; but, seized with illness at Ancono, where the fleet was to assemble, he died (Aug. 14, 1464). The literary reputation of Æneas Sylvius has partially eclipsed the historical fame of the Pope. He was one of the most eminent scholars of his age, in many ways a type of the Renaissance learning. The most interesting portion of his works is the collection of his letters, which are full of details characteristic both of the writer and of his age. He left also some partly autobiographical commentaries (republished by Lesca, Rome, 1894). Others of his works, the novel *Lucretius et Euryalus* and his dialogues on the authority of general councils and in defense of the Council of Basel, he formally retracted. Consult: C. Voigt, *Enca Silvio di Piccolomini als Papst Pius II und sein zeitalter* (3 vols., Berlin, 1856-63); G. W. Kitchen, *Life of Pius II as Illustrated by Pinturicchio's Frescoes* (London, 1881); Mandell Creighton, *History of the Papacy*, vol. iii (ib., 1903); Ludwig Pastor, *History of the Popes*, vols. i-iii (ib., 1906-10); William Boulting, *Æneas Silvius (Pius II), Orator, Man of Letters, Statesman, and Pope* (ib., 1908); C. M. Ady, *Pius II, the Humanist Pope* (ib., 1913), containing an exhaustive bibliography.

PIUS III (Francesco Todeschini Piccolomini). Pope, 1503. He was a nephew of Pius II, who made him Bishop of Siena and Cardinal in 1460. He was employed by subsequent popes in various important missions, and succeeded Alexander VI, but lived only a month after his election. Consult Ludwig Pastor, *History of the Popes*, vol. vi (London, 1911).—PIUS IV (Giovanni Angelo Medici, or Medeghino). Pope 1559-65. He was born in 1499, studied medicine and law, and devoted himself to the latter as a profession. Later he went to Rome and entered on an ecclesiastical career, being named Archbishop (1545) and Cardinal (1549) by Paul III. Elected Pope after a conclave lasting more than three months, he entered upon a heritage of many troublesome questions. The principal significance of his pontificate lies in his reassembling of the Council of Trent, which Paul IV had thought to have practically completed its task. It was finally closed, after further sessions lasting nearly two years, in December, 1563, and the bull confirming its decrees was issued January 26 following. The well-known creed called the Creed of Pius IV, or the Tridentine confession of faith, was issued by Pius as an embodiment of all the doctrines defined in the council. (See PIUS IV, CREED OF.) Pius exerted himself vigorously to carry out the reforming decrees of the council, though much of this work was

reserved for the following pontificate. He died Dec. 9, 1565, in the arms of his nephew, Charles Borromeo (q.v.), whom he had made Cardinal. Consult *Cambridge Modern History*, vol. ii (New York, 1904), and Leopold von Ranke, *History of the Popes*, vol. i (London, 1908).—PIUS V, SAINT (Michele Ghislieri). Pope, 1566-72. He was born in 1504 at Bosco, near Alessandria, entered the Dominican Order at 14, and after the completion of his studies was employed in various capacities, educational and administrative. Paul IV made him Bishop of Sutri in 1556, Cardinal in 1557, and grand inquisitor in 1558. His main task as Pope was to enforce the reforming decrees of the Council of Trent. Auster and self-denying in his personal life, he expected equal devotion on the part of others, and met opposition with unflinching firmness. He republished the bull *In Cæna Domini* (q.v.) in a more rigorous form, and excommunicated and attempted to depose Elizabeth of England for her refusal to submit. He was urgent for the abolition of all toleration of Protestantism. The resources of the papacy were employed to assist the Catholic cause against the Huguenots in France, to aid Spain in overpowering the Netherlands, and to protect Christendom from the Turks. With Spain and Venice Pius organized the Holy League against the Turks, who were signally defeated in the naval battle of Lepanto. He completed the Roman catechism and published thoroughly revised editions of the missal and breviary. He was canonized by Clement XII in 1712. Consult: Joseph Mendham, *Life and Pontificate of Pius V* (London, 1832); F. A. P. Falloux, *Histoire de saint Pie V* (3d ed., 2 vols., Paris, 1858); Benno Hilliger, *Die Wahl Pius V zum Papste* (Leipzig, 1891); *Cambridge Modern History*, vol. ii (New York, 1904); Leopold von Ranke, *History of the Popes*, vol. i (London, 1908).

PIUS VI (Giovanni Angelo Braschi). Pope 1775-99. He was born of an impoverished but noble family in 1717 and early entered the ecclesiastical service, being made Cardinal in 1773 by Clement XIV, whom he succeeded two years later. After long controversy he was obliged to compromise on questions of ecclesiastical appointments with the Emperor Joseph II and the King of Naples; but his greatest troubles came from the aggressions of the French Republic. The Pope had rejected the clerical laws of 1791 and protested against the execution of Louis XVI. In 1793 a popular tumult in Rome, which was caused by the imprudence of a French political agent named De Basseville, resulted in his death and added to the difficulties. In 1796 Bonaparte took possession of the legations and afterward of the March of Ancona, and by a threatened advance upon Rome extorted from Pius, in the Treaty of Tolentino (February, 1797), the surrender of these provinces, which were constituted part of the Cisalpine Republic. Finally the Directory ordered an advance upon Rome; Berthier entered the city Feb. 10, 1798, where the Roman Republic was proclaimed, and 10 days later the Pope, refusing to renounce his temporal sovereignty, was seized and carried off to Siena and later to the Certosa, near Florence. On the threatened advance of the Austro-Russian army in the following year, he was transferred to Grenoble, and finally to Valence on the Rhone, where, worn out by age and the rigor of confinement, he died, Aug. 29, 1799, after the

longest pontificate until then recorded. Consult: F. K. Nielsen, *History of the Papacy in the Nineteenth Century* (2 vols., New York, 1906); Jules Gendry, *Pie VI* (2 vols., Paris, 1907); *Cambridge Modern History*, vol. x (New York, 1907); Leopold von Ranke, *History of the Popes*, vols. ii, iii (London, 1908-12). For his French relations, consult *Acta Pii VI* (2 vols., Rome, 1871).

PIUS VII (Gregorio Luigi Barnaba Chiaramoni). Pope, 1800-23. He was born at Cesena in 1742, entered the Benedictine Order at the age of 16, and was employed in teaching philosophy and theology at Parma and afterward at Rome. He was appointed Bishop of Tivoli, and in 1785, being created Cardinal, was transferred to the see of Imola. Upon his election to the papacy in 1800 Rome was restored to the papal authority, and in July of that year Pius VII entered his capital, and in the following year the French troops were withdrawn from the papal territory, with the exception of the legations. From this time forward Pius, ably seconded by his Secretary of State, Cardinal Consalvi, was destined to occupy a prominent place in the political as well as the ecclesiastical affairs of Europe. Bonaparte had resolved to restore religion in France on the ancient basis of connection with Rome. With this view he entered into negotiations with Pius VII for the establishment of a concordat suited to the new order of things which had arisen. It was agreed to at Paris, July 15, 1801, ratified in Rome, August 14, and published in Notre Dame on Easter Sunday, 1802. But, simultaneously with the concordat, and as if forming part of the same arrangement, was published a code of what were called organic laws, seriously affecting the discipline of the Church with regard to marriage, the clergy, and public worship, which had never been submitted to Pius, and to which he not only had not consented, but to which he found himself compelled to offer every opposition. For the first year following the publication of the concordat no occasion of difficulty arose, but conflict of principles was in the end inevitable. In 1804 Bonaparte, having resolved on assuming the Imperial crown, invited Pius to come to Paris for the purpose of crowning him, and the Pope, although with much hesitation, consented. He took advantage of his visit to demand the recall or modification of the articles of the code, but without success, and although, during his visit to Paris, he was treated with great distinction and reverence, his relations with Napoleon from that date began to assume a less friendly character. The French Emperor now proceeded from one petty outrage to another, until finally, in February, 1808, the French troops, under General Miollis, entered Rome and took possession of the Castle of Sant' Angelo, and on April 2 a decree was issued annexing the provinces of Ancona, Ferma, Urbino, and Macerata to the Kingdom of Italy. Pius, besides protesting against the usurpation, declared himself a prisoner in the French hands and confined himself to his palace. Finally (May 17, 1809) the usurpation was consummated by a decree annexing Rome and all the remaining papal territory to the French Empire. This was the signal for the Pope's abandoning his policy of forbearance. On June 10 Pius issued a bull of excommunication, directed (without naming Napoleon) against the perpetrators and abettors of the invasion of the rights and

the territory of the holy see. Soon afterward the French Emperor ordered the removal of the Pope from Rome; and Pius, without offering any resistance beyond the declaration that he yielded to force, was removed, first to Florence, then to Grenoble, thence for a longer time to Savona, whence, in June, 1812, he was finally transferred to Fontainebleau. During this prolonged captivity Pius firmly but quietly resisted every effort to compel or seduce him from his policy. At Fontainebleau he was treated with much external respect; and on Napoleon's return from the Russian campaign, in December, 1812, orders were given that the cardinals, with certain exceptions, should be admitted to the presence of the Pope. Under much pressure, both from the Emperor, himself and from the ecclesiastics to whom the Emperor confided his plans, Pius was induced to sign a new concordat, an important provision of which was the recognition of the annexation of the Roman states to the Empire. Having obtained the concession, Napoleon at once permitted the absent cardinals to return, and of these many remonstrated so earnestly against the concordat that, on March 24, Pius wrote to revoke his consent. Napoleon took no notice of the revocation; nor was it till after the disasters of 1813 that he began to seek an accommodation. Pius refused to treat until he should be restored to Rome, and on Jan. 22, 1814, orders were sent for his immediate return to his capital. Unattended by his cardinals, he was escorted to Italy, and remained at Cesena until the campaign of the spring of 1814 placed Paris in the hands of the allies, when Pius reentered Rome amid the gratulations of the people. During the Hundred Days he was again compelled to leave it; but, after the campaign of Waterloo, he finally resumed possession, which was undisturbed for the rest of his life, and extended to the whole of the ancient territory, including the legations. His last years were devoted to measures of internal administration and were marked by much wisdom and moderation. Pius repressed with great vigor the disorder and brigandage which the long wars had encouraged, and the secret societies, especially that of the Carbonari (q.v.). In 1814 he formally restored the Order of Jesuits (q.v.). His private life was a model of gentleness, simplicity, and benevolence. Consult: François Artaud de Mentor, *Histoire du pape Pie VII* (3d ed., 3 vols., Paris, 1839); Cardinal Pacca, *Historical Memoirs* (Eng. trans. by Sir George Head, London, 1850); D'Haussonville, *L'Eglise romaine et le premier empire* (5th ed., 5 vols., Paris, 1870); M. H. Allies, *Pius VII, 1800-1823* (2d ed., London, 1897); *Cambridge Modern History*, vols. ix, x (New York, 1906-07); Leopold von Ranke, *History of the Popes*, vol. ii (London, 1908)—PIUS VIII (Francesco Xaverio Castiglioni). Pope, 1829-30. He was born at Cingoli, near Ancona, in 1761. He held in succession the bishoprics of Montalto, Cesena, and Frascati, and was made Cardinal in 1816. During his brief pontificate he opposed the slave trade in Brazil, civil marriages in Prussia, and the attacks on the Church emanating from Freemasons and Bible societies. Consult: François Artaud de Mentor, *Histoire du pape Pie VIII* (Paris, 1843); Wiseman, *Recollections of the Last Four Popes* (London, 1858); *Cambridge Modern History*, vol. x (New York, 1907).

PIUS IX (Count Giovanni Maria Mastai-Fer-

retti). Pope, 1846-78. He was born at Sinigaglia, May 13, 1792, and intended to enter the Papal Guards, but symptoms of an epileptic tendency caused him to abandon a military life. He took holy orders and became Archbishop of Spoleto in 1827, Bishop of Imola in 1832, and Cardinal in 1840. He was elevated to the papal chair on June 16, 1846, two weeks after the death of Gregory XVI. Pius IX took hold of the reins of government in the pontifical dominions, imbued with a sense of the evils, political, economic, and social, under which his semimedieval realm had been laboring and with a patriotic desire to raise Italy from her political degradation. He entered at once on a course of reforms, resolving to extirpate all abuses of administration in his state, to secularize the local administration, and to extend the rights of self-government. His first steps were to dismiss his Swiss guards and to grant a general amnesty. The latter measure unfortunately had the effect of bringing together a body of men whom exile had embittered against the existing state of things. The Pope extended his innovations to every department of the administration, not sparing the ecclesiastical institutions and the clergy. At the same time he exerted himself strenuously to improve the economic condition of his people and to promote their intellectual progress. His subjects were permitted to make their voice heard in public assemblies and in the press. His policy awakened enthusiasm among the friends of progress throughout Europe, Protestants and Jews, as well as Roman Catholics. Pius IX was inspired with the dream of a free Italy, and sought to realize the ideal set forth by Gioberti of a federated Italy under the moral primacy of the Pope. But the programme which he embraced was far from satisfying the demands of the revolutionary party represented by Mazzini and his followers, and Austria was ready to combat with force of arms a policy which threatened to subvert her dominion in Italy.

In April, 1847, the Pope announced the institution of a *consulta*, an advisory body consisting of deputies from the provinces. When it assembled in November Pius IX found that he had created a mouthpiece of radical demands, vehemently set forth and backed by the populace, which he was utterly unable to satisfy. A few months later the February revolution of 1848 overthrew the Orleanist monarchy in France, and the Papal States were borne along on the flood of revolution which swept over Europe. Pius IX was forced, while yet unprepared for it, to grant a regular constitution to his subjects, which was promulgated on March 14, 1848. It was an anomalous creation, providing for a triple machinery of legislation—a consistory of cardinals, an advisory council appointed by the Pope, and a Parliament of two chambers. A few days after this event Lombardy and Venice rose against the Austrians, and Charles Albert, King of Sardinia, embarked upon a war for the liberation of Italy. Pius IX was dragged against his will into a struggle with the house of Hapsburg, which was to prove utterly futile. On June 11 the papal forces were compelled to surrender to the Austrians at Vicenza. On July 25 the King of Sardinia met with disaster at Custoza. The revolutionary elements now obtained complete mastery in Rome. On November 15 the Pope's Prime Minister, Count Rossi, was assassinated as he was about to open the session of the Par-

liament. Violent demonstrations took place daily to compel the Pope's assent to measures which he repudiated. He at first confined himself in the Quirinal, and on November 24 fled secretly from Rome, taking refuge in the Neapolitan fortress of Gaeta. A republic was proclaimed in Rome in February, 1849. Pius IX from his exile addressed a remonstrance to the various sovereigns. In April a French expedition, sent to restore the papal authority, landed at Civitavecchia, which surrendered on July 2, after a month's siege. The Pope's government was reestablished, and in 1850 he again entered upon the administration. He now declared that, in view of the unsettled condition of Italy and the failure of many of his early measures of improvement, he could not proceed with the reforms which he had contemplated. With Cardinal Antonelli as Secretary of State, the course of the papal government became intensely reactionary. In 1860, after the war for the unification of Italy, the Romagna, the Marches, and Umbria were annexed to the dominions of Victor Emmanuel, but Pius persistently refused to cede any portion or to enter into any compromise.

His ecclesiastical administration continued very active and proceeded upon the strongest assumption of the right of independent action on the part of the Church. He reestablished the hierarchy in England, sanctioned the establishment in Ireland of a Catholic university, and condemned the principles upon which the Queen's colleges in that country were constituted. He concluded with Austria a concordat much more favorable to Church authority than the existing ecclesiastical laws had permitted. (See CONCORDAT.) In 1854 he issued a decree propounding as a doctrine of the Church the dogma of the Immaculate Conception (q.v.) of the blessed Virgin Mary. The most important event of his pontificate was the convocation of the Vatican Council (q.v.), at which bishops from all parts of the Catholic world assembled, in December, 1869. This was the first Church council since that of Trent had crystallized Roman Catholic dogma and practice to meet the Reformation attack. It was adjourned in July, 1870, after it had proclaimed the decree of the infallibility (q.v.) of the Pope when on a subject of faith or morals he issues a decree *ex cathedra* to the universal Church. Soon after the adjournment the Italian army occupied Rome, which was made the capital of the Kingdom of Italy. Pius renewed with all solemnity his oft-repeated protest and, refusing all proposals of accommodation, from that date declared himself a captive in the Vatican, to which he strictly confined himself until his death, Feb. 7, 1878. Consult Alexander Pougeois, *Histoire de Pie IX et de son pontificat* (4 vols., Paris, 1877-81); Raffaele de Cesare, *Last Days of Papal Rome, 1850-1870*, Eng. trans. by Helen Zimmern (Boston, 1909); James MacCaffrey, *History of the Catholic Church in the Nineteenth Century* (2 vols., St. Louis, 1910).

PIUS X (Giuseppe Melchiorre Sarto). Pope, 1903-14. He was born at Riese, near Venice, June 2, 1835, the son of a postman. After studying at Treviso and at Padua and being ordained to the priesthood in 1858, he was chaplain at Tombolo for nine years and archpriest of Salzano from 1867 to 1875. In the latter year he was made canon of the cathedral of Treviso and in 1878 was elected vicar capitular. Sarto was named Bishop of Mantua in 1884; in that see,

then a hotbed of socialism and agnosticism, he established a reputation for able administration and uncompromising loyalty to the principles of the Church. At the secret consistory in 1893 he was created Cardinal by Pope Leo XIII, and three days later was preconized Patriarch of Venice. The Italian government, which claimed the right to nominate the Patriarch, as the Emperor of Austria had formerly done, refused for a year to grant Sarto his exequatur.

On Aug. 4, 1903, Cardinal Sarto was elected Pope, and five days later he was crowned. Before the end of the year he had abolished the traditional right of veto at the papal election, claimed by several European governments and exercised for the last time (by Austria) against Cardinal Rampolla (q.v.), who otherwise would have been Pope instead of Sarto. Pius early issued the *Motu Proprio*, providing for the reformation, in accordance with the authentic Gregorian Chant, of the music used in the ritual. In 1904 he established commissions to codify the canon law and to reform the Breviary, and later created a Biblical Institute under the control of the Jesuits. His decree *Lamentabile* (or "Syllabus of Pius X"), in which he declared to be errors 65 propositions in the instructions of candidates for holy orders, was published in 1907, and in the same year was issued his famous encyclical *Pascendi*, in which modernism was condemned. In 1906 Pius had resolutely opposed the French law designed to effect a separation of church and state, and, unwilling to compromise, he allowed valuable property to be taken by the secular government rather than sacrifice complete ecclesiastical independence. The Roman Catholic church in the United States he raised to an autonomous position—previously it had been under the missionary jurisdiction of the Propaganda—and in 1911 he created two additional American cardinals (Farley and O'Connell) to take their place beside Cardinal Gibbons. By the Pope's last important official act (May 25, 1914) 13 candidates received the red hat. His death, on August 20 of the same year, was probably hastened by anxiety over the outbreak of the European War. During his illnesses, and especially the last one, his spinster sisters, plain peasant women, cared for him devotedly. Consult: A. M. J. J. Waal, *Life of Pope Pius X*, translated from the second German edition by J. W. Berg (Milwaukee, 1904), Angelo Marchesan, *Papst Pius X in Leben und Wort* (Einsiedeln, 1906); *The Programme of Modernism: Reply to Encyclical of Pius X* (New York, 1908); also *Life of Pope Pius X*, published anonymously (ib., 1904), and *Acta Pii PP. X* and *Acta Apostolicæ Sedis* (Vatican Press).

PIUS IV, CREED OF. The dogmatic formula drawn up by a commission of members of the Council of Trent as a summary of its decisions and promulgated by Pope Pius IV at the end of 1564 in the bull *In Sacrosancta*. Its formal acceptance is required of all priests and teachers in the Roman Catholic church, as well as of all converts to that communion. It begins by embodying the Nicene Creed and proceeds to the later more elaborate definitions. Successive articles declare belief in apostolical and ecclesiastical traditions and all other observances and constitutions of the Holy Roman church; the Holy Scriptures according to that sense which the Church has held and does hold; seven sacraments of the new law instituted by Christ and

necessary for the salvation of mankind, though not of every one; the definitions of the Council of Trent concerning original sin and justification; the doctrine of a true, proper, and propitiatory sacrifice in the mass, transubstantiation, and the reception of Christ whole and entire under either kind, a purgatory, the souls detained in which are helped by the prayers of the faithful; the veneration and invocation of the saints reigning together with Christ and the veneration of their relics and of sacred images; the power and use of indulgences; and the position of the Holy Catholic Apostolic Roman church as the mother and mistress of all churches. It concludes with a promise of fidelity to this faith and of obedience to the Bishop of Rome, successor to St. Peter, Prince of the Apostles and Vicar of Jesus Christ. Its full text may be found in Philip Schaff, *Creeds of Christendom*, third edition, vol. i (New York, 1881).

PIUS IX, ORDER OF. A papal order of merit with two classes, founded by Pius IX in 1847. It is conferred on the nobility for virtue and merit. The decoration is an eight-pointed blue star with gold flames between the arms. The device is *Virtuti et Merito*. Members of the order have a dark-blue uniform embroidered with gold. See Plate I of ORDERS.

PIUTE, or PAIUTE. A name applied loosely to various small bands of Shoshonean stock (q.v.), scattered over the arid region between the Rocky Mountains and the Sierras, from the Colorado almost to the Columbia, in Nevada, northwestern Arizona, eastern California and Oregon, western Utah, and southern Idaho. According to Powell, who took a census of the bands in 1873, the name belongs properly only to those living in or adjoining southwestern Utah, while those now gathered upon Pyramid Lake and Walker River reservations in Nevada, popularly and officially recognized as Piute, are really of another tribe and language, which he calls Paviotso. Still others he classes with the Shoshoni and Banak. A few bands, as the Chemehuevi along the Colorado in northwestern Arizona, and the Mono in the Sierras of eastern California, have acquired a separate tribal recognition. Those of Oregon and the north are frequently known also as Snakes. See SHOSHONI.

Living in a country too barren, as a rule, for agriculture or large game, the Piute subsisted chiefly upon wild seeds, berries, and roots, grasshoppers, and jack rabbits, with fish and ducks from the few scattered lakes. Their houses were the so-called wikiups, low, dome-shaped or elliptical structures open at the top, covered with mats woven from rushes, and equipped with a variety of well-made baskets, but otherwise destitute of furnishing. They formerly went nearly naked, excepting in the coldest weather, when they wrapped around their bodies thick blankets woven from jack-rabbit skins cut into strips, with the hair left intact. Their ordinary weapons were the bow and arrow and club. They did not use the lance or shield, and very few owned horses. The dead were usually cremated. The Ghost Dance religion, the greatest Indian religious movement of modern times, originated among the Piute of Walker River Reservation. Some of the bands were hostile up to 1864, since which time treaties of peace have been made and a large number assigned to reservations. According to the census of 1910 the Piute proper numbered 780. Consult A. L.

Kroeber, *Shoshonean Dialects of California* (Berkeley, 1907).

PIVERT DE SENANCOUR, ETIENNE. See SENANCOUR, E. P. DE.

PIZARRO, pē-zār'rō. A melodrama by Sheridan, produced in 1799. It was taken from Kotzebue's drama *Die Spanier in Peru*.

PIZARRO, Sp. pron. pē-thār'rō, FRANCISCO (c.1470-1541). The conqueror of Peru. He was the illegitimate son of Gonzalo Pizarro, a prominent soldier in the army of the great captain Gonsalvo de Córdoba, and was born at Trujillo, in Estremadura, Spain. In 1509 he sailed for America with Ojeda, whose fortunes he followed for several years. In 1519 he settled down on a small land holding in the new city of Panama. Three years later he formed a partnership with Diego de Almagro (q.v.) and Father Luque to explore the country discovered by Andagoya to the south of the isthmus. A first expedition in 1524 accomplished nothing, and a second in 1526, undertaken with the assistance of Gaspar de Espinosa, threatened to ruin the partners. Enough of the country was seen, however, to prove that it contained much wealth, and so Pizarro landed on the island of Gallo, not very far from the equator, while Almagro returned for assistance. The sufferings of the men had been so great, however, that the Governor at Panama sent a vessel to bring them all back. Pizarro refused to embark, and drew on the sand with his sword the famous dividing line, beyond which he declared lay labor, hunger, thirst, sickness, and every kind of danger, but also the chance for glory and heroic achievement. Thirteen men crossed to stand by him, while the rest went back to Panama. Pizarro maintained himself for several months until the arrival of Almagro, and then they continued to explore the mainland as far as the Gulf of Guayaquil. Convinced that his resources were insufficient to embark upon the conquest of this highly civilized region, Pizarro collected irrefutable evidences of its wealth, and then went back to Panama, whence he proceeded to Spain in 1528. Charles V granted him authority to conquer and govern this territory with the title of Adelantado. Pizarro enlisted a considerable force, including his four brothers. (See PIZARRO, GONZALO.) In 1530 he was back at Panama, and in January, 1531, he started for the real conquest of Peru. The rest of the career of Francisco Pizarro belongs to history of Peru (q.v.). Consult: Sir Arthur Helps, *Life of Pizarro, with Some Accounts of his Associates in the Conquest of Peru* (2d ed., London, 1869); Sir C. R. Markham, *A History of Peru* (Chicago, 1892); F. A. Ober, *Pizarro, and the Conquest of Peru* (New York, 1906); W. H. Prescott, *History of the Conquest of Peru*, in Everyman's Library (ib., 1909).

PIZARRO, GONZALO (c.1505-48). A Spanish conquistador, brother of Francisco Pizarro. See PERU, History.

PIZZICATO, pēt'sē-kū'tō (It., twitched), abbreviated pizz. A word used in music for stringed instruments to denote that the strings, instead of being played as usual by the bow, are to be twitched with the fingers in the manner of playing on a harp or guitar. The letters *c. a.* (*col arco*, with the bow) indicate that the use of the bow is to be resumed.

PIZZICOLLI, CRIACIO DE'. See CYBIACUS.

PLACE, FRANCIS (1771-1854). An English reformer. He was apprenticed to a maker of

leather breeches and afterward worked at that trade and as a tailor. In 1794 he joined the London Corresponding Society, a reform club, and for three years was prominent in its work. After 10 years of retirement (1797-1807), in which he diligently studied social and economic questions, he returned to politics, made the acquaintance of William Godwin, Robert Owen, Jeremy Bentham, James Mill, and many others, and about 1812 began indirectly a great work, acting as tutor or coach to various parliamentary reformers, among whom Joseph Hume should be mentioned. In 1824 he won a notable triumph by procuring the abolition of the laws against workingmen's combinations. Seven years afterward he was interested in the Reform Bill, and by his placard, "Go for Gold and Stop the Duke," brought on a brief run on the Bank of England and contributed to the causes preventing Wellington's forming a cabinet. With John Arthur Roebuck (q.v.) he wrote various political pamphlets in 1835. His pamphlets, letters, magazine and newspaper articles are diffuse and unattractive in style, but very valuable for the light they throw upon the social and economic history of the nineteenth century. *The Principles of Population* (1822) was his only published book. Consult Graham Wallas, *Life of Francis Place* (London, 1898).

PLACE, plās, VICTOR (1819-75). A French Assyriologist and diplomat, born in Paris. He entered the Foreign Office in 1839, acted as consular agent in Naples, Gibraltar, and Haiti, showing himself able and brilliant but grasping and self-seeking. In 1851 he became Consul at Mosul, succeeding Botta, whose work of excavation at Khorsabad he continued in conjunction with Oppert and Frenel. His discoveries, especially regarding Assyrian architecture, the large use made of colored enameled bricks on the lower parts of city walls, and the variety and brilliance of borders and figure decorations on these mural facings, were very valuable. The actual spoils of the excavations were loaded on a float buoyed with bladders, but in spite of these precautions they were lost in the river near Basra and could not be recovered. Place was highly honored by the Academy of Inscriptions on his return to France in 1855, and became Consul General at Jassy in Moldavia, a post from which he was soon removed because of his abuse of power. He was sent to Adrianople in disgrace, but in 1870 was transferred to New York, where he took advantage of his office and his country's need, bought defective rifles for the French army, and charged so high a price for them that he made more than 600,000 francs for himself before he was discovered. He was twice tried in Paris, and was sentenced to two years' imprisonment in 1872, but was pardoned by Thiers. Place's *Ninivé et l'Assyrie* (1867-70; text 2 vols., plates 1 vol.) is an authority on Nineveh.

PLACE DE LA CONCORDE. See CONCORDE, PLACE DE LA.

PLACE MAKER'S BIBLE. See BIBLE, CURIOUS EDITIONS OF.

PLACENTA (Lat., flat cake). The after-birth—a spongy vascular mass attached to the uterus before the birth of a young animal and expelled after labor is completed. It is the structure that unites the fetus to the wall of the maternal uterus. It occurs in all mammals except the egg-laying ornithorhyncs and echidna, though only rudimentary in the mar-

supials. It presents a variety of forms among the different mammals. Thus, in the pig, the mare, and the cetacea it is diffused over the whole interior of the uterus and is termed *diffuse*; in ruminants it is attached in scattered segments over the uterine wall, *cotyledonary*; in certain of the edentata, the elephant, and carnivora it occurs as a zone around the uterine surface, *zonary*; in most of the edentata, the insectivora, and rodentia it is found as a circular disk, *discoidal*; while in the monkeys and in man, being first arranged in scattered patches and later as a disk, it is known as *metadiscoidal*. The placenta is formed in its greater part from hypertrophy and other changes in those chorionic villi which chance to be in contact with the uterine surface when fetation begins. The development of these adherent villi produces what is known as the fetal portion of the placenta, while the remainder, the decidua serotina, furnishes the maternal portion. Around the placental villi are developed vascular spaces in which certain arteries and veins from the uterine wall communicate freely. The villi being thus immersed in the maternal blood, osmotic interchange takes place between the fetal and maternal circulations. On gross inspection the placenta presents itself as a round or slightly oval disk from 6 to 8 inches in diameter and from $\frac{3}{4}$ inch to 1 inch in thickness. The fetal surface is smooth and covered by the amniotic membrane, which is reflected from the cord on to the placenta at its centre and again from the placental margins to the uterine wall. The maternal surface is deep red, rough, and irregular, and is divided by numerous grooves or sulci. A close inspection shows this surface to be covered with a fine, delicate membrane which dips down into the sulci and which is the stripped-off cellular layer of the decidua serotina. Attached to the fetal surface of the placenta, usually at its centre, but occasionally at or near its margin, is the umbilical cord. The cord is a whitish, semitransparent structure of an average length of about 20 inches and a diameter about that of the little finger. It consists of two arteries and a vein twisted upon one another and surrounded by a peculiar gelatinous substance, called the jelly of Wharton, which gives the cord its characteristic appearance.

The function of the placenta is both respiratory and alimentary. It aerates the fetal blood by the interchange of oxygen and carbon dioxide. (See BLOOD; CIRCULATION.) In its nutritional function it supplies material for the growth of the fetus, at the same time removing waste products. The placenta is subject to several pathological abnormalities in form and attachment, to inflammation, and to degenerative changes. For their detailed description, and for the treatment of that dangerous form of misplacement known as placenta previa, consult H. J. Garrigues, *Obstetrics* (2d ed., Philadelphia, 1913).

PLACENTA. In plants, the region to which ovules are attached in an ovary. The name was given under the impression that ovules are eggs and that the tissue of the ovary wall from which the ovules develop should be called the placenta.

PLACENTIA. The ancient name for Piacenza (q.v.).

PLACE OF WAILING. An inclosed place near the Mosque of Omar (q.v.) in Jerusalem, where the Jews congregate every Friday to lament the fall of Israel and pray for its restora-

tion. The wall in front of which they gather is 156 feet in length and 59 feet in height. The nine lowest courses of stone consist of large blocks, some of which are drafted; one is 16 $\frac{1}{2}$ feet long and 13 feet wide. Above there are 15 courses of smaller stones. Some of the lower courses may have belonged to Herod's temple.

PLACER MINING. See GOLD.

PLACETAS, plā-sā'tās. A town of the Province of Santa Clara, Cuba, 22 miles southeast of the city of Santa Clara and connected by rail with the coast towns of Caibarien and Sagua la Grande (Map: Cuba, F 4). It is in the midst of an extensive sugar-producing region. Pop., 1899, 5409; 1907, 6184.

PLACE'US. See LA PLACE, JOSUÉ DE.

PLACIDE, plā-sēd', HARRY (1799-1870). An American comedian, born in Charleston, S. C. He was the son of a French variety actor and his training for the stage began in childhood. After living several years in the South he made his appearance in 1823 at the Park Theatre, New York, as Zekiel Homespun, one of his most popular characters, and for the next 20 years he was a member of the Park Theatre company. Here and afterward as a star he seems to have won the unmingled admiration of the critics in rôles as varied as those of the Fat Boy in *Pickwick*, Sir Harcourt Courtly in *London Assurance*, Sir Peter Teazle, Dr. Ollapod, and Grandfather Whitehead. After his retirement in 1865 he settled in Babylon, L. I. Consult J. N. Ireland, *Records of the New York Stage* (2 vols., New York, 1866-67), and W. L. Keese, *A Group of Comedians* (ib., 1901).

PLACID'IA. See HONORIUS; VALENTINIANUS III.

PLAC'ODERM (from Gk. πλαξ, *plax*, tablet, plate + δέρμα, *derma*, skin). An order under the subclass Ganoidei in the older classifications of fossil fish. It included genera in which the head and forward part of the trunk were covered by heavy plates; e.g., *Pterichthys*, *Bothriolepis*, *Coccosteus*, *Dimicthys*. The group was based on superficial resemblances, and it has been broken up and the genera distributed among other orders. See DIPNOI; LUNGFISH; OSTRACODERMI; and articles on the genera mentioned above.

PLACOIDEI, plā-koi'dē-i (Neo-Lat. nom. pl., from Gk. πλακῶδης, *plakōdēs*, flat, from πλαξ, *plax*, tablet, plate + εἶδος, *eidos*, form), or **PLACOID FISHES.** An order of cartilaginous fishes, in the classification proposed by L. Agassiz, characterized by having placoid scales, irregular plates of hard bone, not imbricated, but placed near together in the skin. The term is no longer in scientific use.

PLACOPH'ORA (Neo-Lat. nom. pl., from Gk. πλαξ, *plax*, plate, tablet + φέρω, *pherein*, to bear). A division of Mollusca, containing only the chitons. The modern chitons are descendants of a race which, though never represented by any considerable number of species or individuals, began in the early Paleozoic and persisted with little change of form down to the present day. The first are known in the Ordovician rocks, they are scattered through the Silurian and Devonian, and they attained a slight prominence in the Carboniferous. The Paleozoic species number about 20, and they are distinguished from those of the Mesozoic and Tertiary by the less perfect articulation of their valves and lesser degree of ornamentation of the surfaces of their shells. Few Mesozoic species are known and the group is represented in the Tertiary by

about 50 species that show very close relationship to the modern forms.

PLA'GAL CADENCE. See HARMONY, *Cadences*.

PLA'GIAULAX (Neo-Lat., from Gk. πλάγιος, *plagios*, aslant + αὐλαξ, *aulax*, furrow). A genus of Jurassic mammals, typical of the family (Plagiaulacidae), known only from lower jaws fossilized in the English Purbeck beds, which imply an animal of the size of a small rat and representing the primitive multituberculate type of dentition. (See illustration.) It is believed the rodent-like incisor teeth did not grow from persistent pulps, and they have no anterior coating of enamel. The centre of the two molars on each side is hollowed, and the raised rim is beset with tubercles. Associated genera are *Bolodon*, *Allodon*, and *Ctenacodon*, the last named based on lower jaws found in the Laramie formation of Wyoming. Woodward says that the family does not seem to have become extinct until early Tertiary times, for two other genera, *Neo-plagiaulax* and *Ptilodus*, are known from the Lower Eocene of France and New Mexico respectively.

PLAGIAULAX MINOR.

Right lower jaw, showing molars (m) and premolars (p).

PLA'GIOCLASE (from Gk. πλάγιος, *plagios*, oblique + κλάσις, *klasis*, fracture, from κλάν, *klan*, to break). A name originally introduced by Breithaupt and applied by him to the triclinic feldspars of the albite-anorthite series of minerals contained in the feldspar group. See FELDSPAR.

PLAGIOTOMI, plāj'ī-ōs'tō-mī (Neo-Lat. nom. pl., from Gk. πλάγιος, *plagios*, oblique + στόμα, *stoma*, mouth). A suborder of cartilaginous fishes, coextensive with the Selachii. See ELASMOBRANCHII.

PLAGUE (Lat. *plaga*, plague, destruction, injury, blow, from *plangere*, connected with Gk. πλῆσσειν, *plassein*, Lith. *plakti*, to strike, and possibly with Goth. *flōkan*, OHG. *fluohhōn*, Ger. *fluchen*, to curse), BLACK DEATH; BUBONIC PLAGUE; CATTLE PLAGUE, PESTIS; PESTIS BUBONICA; PESTIS INGUINALIS. An acute infectious disease caused by the presence of a specific microbe, *Bacillus pestis*, and characterized by enlargement and suppuration of lymphatic glands.

History. Under BLACK DEATH is given the history of plague to and including the pandemic of 1334 to 1351, when China, India, Persia, Turkey, Russia, Germany, Italy, Greece, France, England, and Norway were devastated and many millions of people died. Proust is authority for the statement that between the eleventh and fifteenth centuries at least 30 minor epidemics of the disease appeared in different parts of Europe. A grave and important epidemic was traced from Syria to Marseilles in 1720, when 86,000 people fell victims to the plague in that city. During the epidemic of 1770-71, which probably passed from Jassy through Kiev, 80,000 persons died in Moscow alone. Early in the nineteenth century Constantinople became the seat of two severe epidemics, one in 1803, with 150,000 deaths, and the other in 1813, with 110,000 deaths. The Balkan Peninsula was visited by the dread disease on several occasions between 1814 and 1841; Greece suffered in 1828, and the southern part of Italy in 1815. Russia,

in the neighborhood of Astrakhan, was swept by an epidemic from 1877 to 1879. While Europe was passing through this period, Africa and Asia were suffering terribly. Kitasato reports 21 epidemics between 1783 and 1844 in Egypt. Tripoli suffered in 1874, as did also Arabia. In the river valleys of the Tigris and the Euphrates outbreaks occurred in 1773, and several subsequently; and as lately as 1876, from which date it raged until 1895. The plague in Persia has been intermittent and of frequent occurrence; perhaps the epidemic of 1876-77 is most noteworthy, because it was the source of the Russian infection in 1877. In India the disease has been endemic for centuries, although reliable and accurate accounts date only from 1815. Its record since that date has been unbroken. Bombay has been a special sufferer since 1896. To trace or chronicle the course and outbreaks of the plague in China would be very difficult. The greatest visitation of the scourge, in 1342 and the following years, has been described. (See BLACK DEATH.) There were outbreaks of the disease in 1850, 1866, 1871, and 1872, and subsequently. The latest pandemic of plague began in 1894 and encircled the globe. Beginning in south-central China, where it had been endemic for centuries, it spread by the tides of travel until it reached the United States. It first invaded Canton, Hongkong, Amoy, and Macao; thence it spread to Japan and Asiatic Turkey; thence to Russia, Austria, and Portugal, in Europe, and to a number of localities in Africa. In 1899 it reached Hawaii, New Caledonia, and the South American countries. Ten years later it appeared in Australia, New Zealand, the Philippines, Germany, and Great Britain; California being infected by way of Hawaii. A few cases made their appearance in Porto Rico and Cuba. During this time the plague raged steadily in India, hundreds of thousands of people dying in some years. During 1912, 47 cases were reported in Porto Rico, with 23 deaths. From this time the disease was under control in the Western Hemisphere, and showed signs of waning in India and other eastern countries.

Cause. Plague is caused by the presence of a specific microorganism, the *Bacillus pestis*, which was discovered independently by Kitasato and Yersin in 1894. It is a small rod, short and thick, with rounded ends that stain more readily than the central portion, showing the pole staining. The bacilli are found in pairs or singly and, in cultures, arranged in chains. They are encapsulated, aerobic, do not form spores, and are nonmotile. They occur in enormous numbers in the smaller glands (buboes), in the spleen, and, after death, in the blood. The unsanitary conditions under which the affected individuals live give ample opportunity for the direct or indirect transmission of the disease from patient to patient by fleas, flies, lice, or other insects. (See INSECT.) The bacillus may enter the body by the skin surface, through cracks or wounds, by the respiratory passages, or by the alimentary canal. The infection is spread chiefly by rats, through the medium of fleas, although other rodents, such as the ground squirrel in California and a species of marmot in Manchuria, may serve either as active disseminators or as reservoirs of the disease. An epidemic of rat plague nearly always precedes an outbreak among human beings, an observation made in Brahmanical medical literature as early as 500 B.C.

Symptomatology. Two forms of plague are described—*pestis major* and *pestis minor*. *Pestis minor* includes various pathological conditions, all of favorable prognosis, presumed to be caused by the plague infections. In the abortive form slight fever, slight swelling of the glands, or local tenderness with trivial systemic involvement constitute the attack. In other cases prostration, headache, vertigo, and gastrointestinal disturbances occur. Those cases occurring in houses in which plague has been found, and during a plague epidemic, are considered to be related to the scourge; but no bacteriological examinations have verified the suspicions. In the tropics these cases are often called climatic bubo. *Pestis major* (the severe or ordinary plague) presents three main clinical types: (1) bubonic, (2) pneumonic, (3) septicæmic. An average attack of bubonic plague presents the following course: The period of incubation lasts from 2 to 10 days. The period of invasion, or prodromal period, varies from 24 to 48 hours in length, and during it the patient suffers with chills, fever, vertigo, headache, and vomiting. Bubo development follows, with staggering gait, tremulous speech, and great restlessness; a temperature of 104° F. or higher; a full pulse, averaging 130 to the minute; a dry, granular tongue covered with a yellow velvety fur, but with a red margin; an anxious and pallid face; constipation; and the enlargement of glands in the neck, groins, or axillæ, constituting the buboes. Following the appearance of the buboes occurs a fall in temperature and pulse rate, generally on the second or third day of the disease. After a short remission the fever ascends to 103° or 105° F., at which point it remains for several days, during which time the bubo reaches its full development. After 10 days the temperature falls. Emaciation and exhaustion are extreme. The patient may die of heart failure, in syncope, or of hemorrhage, of peritonitis, of hyperpyrexia; or he may recover in about two months. The buboes often suppurate, or become necrotic, sometimes involving considerable areas of surrounding tissues. In pneumonic cases foci of broncho-pneumonia are found in the lungs, each focus surrounded by a congested pulmonary tissue. Occasionally the alveoli are found full of sanguinolent fluid which is swarming with plague bacilli.

Prognosis and Mortality. In the majority of cases the prognosis of the disease is extremely unfavorable, much depending on the character of different epidemics. Septicæmic cases are almost always fatal in the colored races, the Caucasian mortality being about 60 per cent; bubonic cases kill 80 or 90 per cent of the colored and about 33 per cent of the whites. The mortality varies in different epidemics. In certain epidemics from one-half to three-quarters of an entire population has perished. In the Hong-kong epidemic of 1894 the mortality was 95 per cent. In Bombay during 1896 and 1897 it was 50 to 60 per cent, while during 1898 to 1901 it averaged 80 per cent. The International Plague Conference considered from the Mukden epidemic of 1910 that the mortality was nearly 100 per cent.

Prophylaxis. As the eliminated bacilli may enter the healthy individual directly by cutaneous infection, by inhalation, or by ingestion (as has been abundantly proved), or may enter indirectly, by means of flies, fleas, rats, etc., it is evident that inspection, isolation, and disinfection

must be employed to prevent or limit an epidemic of plague. The most effective single preventive measure is the thorough extermination of rats, especially when accompanied by rigorous enforcement of house and communal sanitation. The buildings must be made rat-proof, fumigation with hydrocyanic-acid gas is to be instituted, walls and floors are to be washed with phenol disinfecting fluid, etc. The sick must be isolated, infected dwellings fumigated, clothing, bedding, etc., burned. The bodies of the dead should be cremated, or covered with chloride of lime if buried. All excreta should be burned. Isolation of the convalescent should be continued, according to Kitasato, for a month after apparent recovery, plague bacilli being found in the blood three or four weeks after all symptoms have disappeared. Rigid quarantine is necessary during an epidemic. Seaports protect themselves by examining and fumigating all vessels arriving from countries known to be infected with plague. Rats arriving on such vessels may escape to shore and spread infection, and precaution must be taken against this.

Specific prophylaxis may be employed before or during an invasion of the disease by means of Yersin's serum or Haffkine's prophylactic fluid. The serum devised by Yersin is blood serum taken from horses that have been inoculated with the plague bacillus. Hypodermic injection of the serum causes immediate immunity, which lasts only 12 to 14 days. It is therefore suitable to protect members of a family in which a case of plague is discovered. Haffkine's fluid is a culture of the *Bacillus pestis* rendered virulent by special methods, the bacilli, after abundant growth, being killed by an exposure to a temperature of 70° C. for several hours. Inoculation with Haffkine's fluid has the advantage of conferring immunity lasting from a few days to several months. Authorities recommend the provision of Yersin's serum for prompt use in order to arrest an epidemic in the first cases, and the employment of Haffkine's fluid to inoculate the people dwelling in localities threatened with an invasion of the disease.

Treatment. The treatment of plague has been in the past mainly symptomatic. Incision of the bubo should not be made until suppuration is established. But the best (though still unsatisfactory) results have been obtained from the use of Yersin's serum. It has increased recoveries 15 per cent, besides being an unquestioned preventive. It is most effective when injected into the veins. Consult: Rupert Blue, *The Post-Mortem Diagnosis of Plague* (Washington, 1912); F. Neufeld, *Seuchenentstehung und Seuchenbekämpfung* (Berlin, 1914); S. M. Guiteras, "Plague in Havana," in *Journal of the American Medical Association* (Chicago, Jan. 2, 1915), especially the conclusions; R. H. Creel, *Bubonic Plague* (Washington, 1914).

PLAGUE, CATTLE. A disease of cattle. See TEXAS FEVER.

PLAGUES OF EGYPT. A series of miraculous signs and judgments by which, according to Ex. vii. 8-xi. 10, xii. 29, xiv. 26-29, Moses and Aaron proved that they were messengers of Yahwe, Israel's God, and punished the people of Egypt for the King's obstinate refusal to let Israel go into the wilderness to celebrate a festival. Ordinarily the plagues are regarded as 10 in number, viz.: (1) turning the river into blood, (2) frogs, (3) lice, (4) flies, (5) mur-

ain, (6) boils, (7) hail, (8) locusts, (9) darkness, (10) slaying of the first-born. But it is told by many interpreters that the lice (3) and the flies (4) are the same plague and also that the murrain (5) and the boils (6) are only variants; so that it may be assumed that viii. 6-19 and ix. 8-12 are interpolations. On the other hand, Ex. iv. 9 suggests that the turning of water into blood was the third sign, two others having preceded, the change of a rod into a serpent and the serpent into a rod again, and the hand turning leprous and being restored. The omission in our text of the second sign after vii. 13, which Moses had been commanded to perform (iv. 8), may be connected with the numbering of the plagues. Scholars who accept the document theory (see PENTATEUCH) think that in the Yahwist Moses merely proclaimed each sign, which was then wrought by Yahwe. In the Elohist Moses stretched forth his hand and brought the evil upon Egypt, and in the Priests' Code Aaron was told to stretch forth his rod. Following this clew, they infer that the earliest of these sources told of 7 plagues of such a nature as may befall any country, the second of 5 (or 10) plagues, and the third of five plagues characteristic of Egypt. Eerdmans regards the passages ascribed to the Priests' Code as the original groundwork and the rest as interpolations, adding to the number of miracles by which Israel was delivered. It is indeed evident that the text has passed through many vicissitudes. The Samaritan recension contains a number of passages, not found in the Masoretic text, after vii. 18, vii. 29, viii. 19, ix. 19, x. 3, xi. 3. Since they fill obvious gaps in the narrative, and since partial repetition would be natural in this case, some scholars have looked upon these passages as part of the original text. Others have regarded them as additions made by Jewish or Samaritan copyists to render the account smoother. Whether they show that one recension has been expanded or that the other has been condensed, they indicate a process of change that is likely to have gone on since the story was first recorded. The attempt to prove that some of the plagues are based on phenomena natural to the Nile valley cannot be said to be convincing. It has been maintained that especially the so-called Priestly Writer bases his plagues upon the order in which such occurrences would come in Egypt in the course of a year. But it is extremely doubtful whether the story in any form connected the change of the water into blood with the discoloring of the Nile water, as it rises at the end of June. This was not a calamity, but an earnest of great blessings. A pestilence would not select the first-born. To the author each plague was manifestly a fresh miracle. The heaping up of such wonders is a feature often recurring in the apocalypses. A duel between thaumaturgists is also a common motive. Whether the power of the Egyptian magicians, who did not remain nameless (see JANNES AND JAMBRES), to imitate three miracles is a sign of a comparatively early age with its naïve ideas, or of later refinement, can scarcely be decided. Some scholars look upon the paschal rites as the beginning of the whole story. All that opens the womb belongs to Yahwe. The Egyptians refused to let Israel go into the wilderness to offer the first-born of man and beast at the spring festival. Yahwe graciously accepted the blood of the lamb as a substitute for Israel's first-born, as He accepted

the ram for Isaac in the thicket, but exacted from the Egyptians their first-born. This they might have avoided if they had heeded the warning signs. Thus it is supposed that the story attached itself to the tradition of a successful escape from Goshen (q.v.) across the Sea of Sedges to the mountain of Sinai (q.v.).

PLAGUE YEAR, JOURNAL OF THE. An imaginary narrative by Daniel Defoe (1722) of the plague of London in 1665.

PLAICE (OF. *plais*, *plais*, Fr. *plaise*, Sp. *platija*, from Lat. *plattessa*, flatfish, plaice, from Gk. *πλαρίς*, *platys*, flat, Lith. *platus*, broad, Skt. *prthu*, wide, from *prath*, to spread out). 1. A European flounder (*Pleuronectes platessa*) rather broad in proportion to its length; the upper surface of the body and the fins olive brown, marked with large bright-orange spots; a row of similar spots on the dorsal fin and on the anal fin. The plaice inhabits sandy and muddy banks, not in very deep water, feeds on worms, mollusks, small crustaceans, and young fishes, and ordinarily weighs seven or eight pounds. It is taken both by lines and by trawl nets, and its flesh is highly esteemed. 2. In America the name is locally applied to the summer flounder (*Paralichthys dentatus*; see FLOUNDER), an extensive account of which is given by G. B. Goode in *Fishery Industries*, sect. i (Washington, 1884). See Plate of FLATFISH AND FLOUNDERS.

PLAIDEURS, plā'dēr', LES (Fr., The Litigants). The only comedy by Racine (1668). It was suggested by the *Wasps* of Aristophanes, and ridicules the customs and abuses of the French legal profession.

PLAIN (OF. *plain*, from Lat. *planum*, level ground, plain, neut. sing. of *planus*, level, even; connected with Lith. *plānas*, flat, OPruss. *plonis*, threshing floor, OLat. *palma*, Gk. *παλάμη*, *palamē*, flat of the hand, *πλάξ*, *plax*, plain, *πλανάν*, *planan*, to wander, OHG. *flah*, Ger. *flach*, flat, OHG. *fluor*, Ger. *Flur*, AS. *flōr*, Eng. *floor*, OIr. *lār*, floor). An expanse of level or gently sloping land. In contrast with a plateau, the surface of a plain is disposed at a low elevation, usually less than 1000 feet, although no sharp line of division can be drawn between the two. The great plains of the United States have an elevation on the western border of 2000 feet or more. In respect to their origin, plains may be classed as marine, lacustrine, fluvial, and plains of denudation. *Marine plains* are formed by the deposition of sediment beneath the sea. The debris brought down by rivers to their mouths is carried seaward by tides and currents and is distributed over a wide area. Thus in time a broad belt of sedimentary strata accumulates along the margins of continental lands, and these sediments may subsequently be raised into land.

The coastal plain (q.v.), which extends along the Atlantic and Gulf borders of the United States, and the North German plain have been formed in this manner. The marine origin may be demonstrated by the character of the fossils included in the strata. *Lacustrine plains* occupy the basins of former lakes the disappearance of which may have been brought about in various ways. The celebrated Vale of Kashmir in north-western India and the great Hungarian plain are covered with fine sediments that were deposited in bodies of fresh water before the outlets had been cut down. In Nevada and Utah there are extensive lacustrine plains which have been laid bare owing to a change of climate from moist to arid conditions, and similar plains are known to occur in Central Asia. A peculiar type is that illustrated by the valley of the Red River of the North; during the Glacial period a great lake was formed here only to disappear with the retreat of the obstructing ice sheet. (See LAKE; LAKE AGASSIZ.) *Fluvatile plains* are built up by the deposition of silt along the borders and at the mouths of rivers. The Mississippi, the Nile, the Ganges, and most of the large rivers of the world have constructed extensive fluvatile plains. (See DELTA; FLOOD PLAIN.) *Plains of denudation* owe their origin to erosion. When land has acquired considerable elevation above the sea, the surface is dissected by the action of running streams which are constantly engaged in widening and deepening their channels. This process when carried to completion results in the reduction of the divides between the streams, producing a broad lowland whose surface lies but little above sea level. If the former elevations are still indicated by unconsumed hills, the lowland is called a peneplain. The plain thus produced may again be elevated and once more subjected to the process of dissection and base-leveling. The great plain of central Russia and the lowlands bordering the Appalachians have probably been formed in this way. See GEOGRAPHY, PHYSIOGRAPHY.

PLAIN, THE. In the French Revolution, the Moderate party in the Legislative Assembly and Convention, in contradistinction from the Mountain. See MONTAGNARDS.

PLAIN CHANT. A term applied to the ecclesiastical chant of the Roman Catholic church. This style of music was used in the Church from the earliest times. It has certain characteristics which distinguish it from any other known music. All the melodies have a stateliness and quiet dignity rendering them particularly appropriate for the use of the Church. The tempo is moderate, and each melody is written in one of those tonalities known as the Church modes. (See MODES.) For the notation a staff of four lines is used, and the notes are all black and square or lozenge-shaped. For the history and development of this system of plain-chant notation, see MENSURABLE MUSIC; MUSICAL NOTATION.

The origin of plain chant has been the subject of much speculation, but the best authorities now agree that it seems exceedingly probable that the chants of the early Christian Church were either taken directly from or modeled after those of the Hebrews. Plain chant, the only form of music ever officially sanctioned by the Church, never made use of instruments. Even the complicated polyphonic works of the school of the Netherlands and the great Roman school banish instrumental accompaniment. It is only

with the rise of the school of Venice towards the end of the sixteenth century that instruments find their way into the Church. When the plain-chant melodies arose, harmony was utterly unknown, and consequently the whole theory of music turned about melodic progression. Choral singing meant nothing else than singing in unison. As long as the persecutions compelled the early adherents of the faith to worship secretly in the catacombs, it was impossible to establish a universal liturgy. However, the melodies were preserved among the various congregations and were handed down from generation to generation by oral tradition, though we can scarcely doubt that in the course of time the original melodies became somewhat distorted. When, after the conversion of Constantine in 312, Christianity became the state religion, free intercourse between the different congregations became possible. Choirs were formed and received special training, so that congregational singing by degrees disappeared. At the Council of Laodicea in 367 a decree was passed prohibiting any one but the regularly trained singers from singing in church. In the beginning of the fourth century Pope Sylvester established a singing school at Rome, which resulted in the composition of original hymns towards the end of the same century. Some of the oldest of these hymns are attributed to St Hilary, who was Bishop of Poitiers about 335. St Ambrose, Bishop of Milan, who died in 397, devoted all his energies to the arrangement and systematizing of all the then known plain-chant melodies. To him also is ascribed the introduction of the four authentic modes, which he selected from among the seven octave species of Ptolemy, because these four most closely resembled the character of the ancient psalm tones. Although the four authentic modes correspond to the Greek Phrygian, Dorian, Hypo-Lydian, and Hypo-Phrygian modes, the Greek names were discarded and the appellations *protos*, *deuteros*, *tritros*, and *tetartos* substituted. St. Ambrose also composed a great number of original hymns, such as *Deus, creator omnium*; *Æterne rerum conditor*; *Veni, redemptor gentium*; *Jam surgit hora tertia*. See AMBROSIAN CHANT.

After the death of St. Ambrose the original purity of plain-chant melodies was corrupted. When in 590 Gregory I became Pope, Church music was in a deplorable state. Recognizing the fact that music is one of the greatest aids to religion, Gregory began his reforms by establishing the *Schola Cantorum*, which in a very short time rose to become an institution of the highest importance and for centuries preserved the ancient traditions. Since the time of St. Ambrose a large number of new hymns had been composed. The old monotony of the chants had given place to a more varied melody, and this naturally led to an extension of the compass beyond the original fifth. The four original or authentic modes were no longer sufficient. Gregory is credited with having established the four *plagal modes* to meet the demands of the advanced art. Besides, he selected also the chants that were to be sung on every day throughout the Church year. The texts and melodies he ordered to be written in a book called *Antiphonarium*, which was declared to be the absolute authority in matters of Church music. The system of notation employed in this book is that known as Neumes (q.v.), consisting of various signs placed above the syllables without employ-

ment of a staff. After plain chant had thus been reformed it spread with astonishing rapidity over all Europe. Especially Charlemagne was instrumental in promulgating this *Cantus Romanus*; for at diets held at Aix-la-Chapelle in 803 and Diedenhofen in 805 he issued strict orders to introduce this manner of singing in all the dioceses of his Empire and established singing schools in various cities, as Soissons, Toul, Orléans, Cambrai, Lyons, and Dijon. Even before the accession of Charlemagne singing schools had been founded at Fulda and Saint-Gall, but, since new hymns were constantly being written, the purity of the style was almost certain to suffer. Thus in 1323 Pope John XXII was obliged to issue a bull restraining musicians from unlawful innovations. Acting on the recommendation of the Council of Trent, Pope Gregory XIII in 1576 took active steps towards a purification of the style of Church music. But by that time the art of music had made enormous strides; polyphonic music had arisen. Although the new music never had been officially sanctioned, it was not only tolerated but was favored. Composers took the old plain-chant melodies as a *cantus firmus* for the tenor, against which the other voices were set contrapuntally. Many composers had little scruple in distorting the original melodies to suit their purpose. But a greater danger to Church music arose from the fact that it became customary to substitute popular secular melodies for the plain chant. At this time Palestrina established the true polyphonic Church style. This is founded on the Church modes; simplicity and noble dignity are its fundamental principles, as they ever have been the principles of plain chant. Since the time of Palestrina no new melodies have been added to the large stock of plain chant. Composers have devoted their talents to polyphonic music, but the old plain-chant melodies have remained in constant use up to the present day. The custom at high mass is to sing the *Kyrie*, *Gloria*, *Credo*, *Sanctus*, and *Agnus Dei* in polyphonic or modern harmonic style with instrumental accompaniment. The Introit, Gradual, Tract (or Sequence), Offertory, and Communion, if sung by the choir, are sung in unison to the old plain-chant melodies, to which the organ supplies the harmonies strictly in accordance with the rules governing the Church modes. The *Sursum corda*, Preface, and *Paternoster* are set to the ancient unvarying melodies.

The advance of musical archaeology during the past century has done much towards the restoration of the plain-chant melodies to their original purity. In the earlier centuries the execution of the old melodies was handed down by tradition, and that there was a remarkable uniformity is proved by the existence of a few manuscripts coming from places far apart. Corruption began with the invention of printing. Unfortunately the *Editio Medicea* in 1614 received the official sanction of the Vatican, and for three centuries the old plain-chant melodies were used and known in disfigured and considerably mutilated form. About the middle of the last century Lambillotte in France and Hermesdorff in Germany began to study the old manuscripts. The archbishops of Rheims and Cambrai became interested and introduced a movement for an edition based on the old manuscripts. Strange to say, these attempts aroused suspicion in Vatican circles, and in 1871 Pius IX once more sanctioned the *Editio Medicea*, which with all

its corruptions was issued again at Ratisbon from 1871 to 1881. Nevertheless, despite the papal edict, scholars continued their researches. Especially the Benedictines of Solesmes, under the able leadership of Guéranger, Pothier, and Mocquereau, devoted their energy to this problem of restoration. In 1889 Mocquereau (q.v.) began the quarterly publication of the famous *Paléographie Musicale*, which issues photographic reproductions of the old manuscripts with historical and critical comments. Widespread interest was aroused in 1890 by the publication of Gevaert's (q.v.) *Les origines du chant liturgique*, in which the whole Gregorian tradition was attacked with weighty arguments. Five years later the same scholar published *La mélodie antique*, in which he seemed to strengthen his original position. After careful examination of Gevaert's points by such scholars as Peter Wagner, Gastoué, Frère Houdard, and Riemann, it seems that in some of his conclusions Gevaert went too far. But all authorities now agree that the far-reaching reform of plain chant, while vigorously carried on by Gregory I, had begun before his time and also was continued after his death. The result of all this investigation was that in 1904 Pius X officially withdrew the sanction from the *Editio Medicea* and commanded a new edition, the *Editio Vaticana*, to be made from the original manuscripts. Moreover, the texts of this new edition must agree with those published by Mocquereau in the *Paléographie*.

PLAIN DEALER, THE. A comedy by William Wycherley, produced in 1674, printed in 1677. The plan was taken from Molière's *Le misanthrope*, but the tone of this repulsive story is quite different.

PLAINFIELD. A town including several villages in Windham Co., Conn., 16 miles north-east of Norwich, on the Quinebaug and Moosup rivers and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, H 3). It has public libraries at Moosup and Plainfield villages, and in Plainfield village is the old Plainfield Academy, which was one of the best known in New England towards the close of the eighteenth century. The chief industrial establishments include large cotton and woolen mills,

thread and yarn factories, a foundry, wood-working mills, and wagon shops. The government is administered by town meetings. Plainfield, originally called Quinebeag, was settled about 1691 and was organized as a town in 1699. Pop., 1900, 4821; 1910, 6719.

PLAINFIELD. A city in Union Co., N. J., 24 miles west by south of New York City, of which it is a residential suburb, on the Central Railroad of New Jersey (Map: New Jersey, D 2). It is picturesquely situated at the base of the steep wooded ridge known as First Mountain, is well laid out, contains many beautiful homes, and has public parks, the Muhlenberg Hospital, a large public library, two country clubs, and many fraternal and social organizations. Plainfield is also an important industrial centre, its manufactures including printing presses, machine tools, silk and cotton goods, kid gloves, silver-plated ware, clothing, lumber products, carriages, etc. Pop., 1900, 15,369; 1910, 20,550; 1914 (U. S. est.), 22,755.

PLAINS INDIANS. A general name for the tribes occupying the Missouri basin. See INDIANS.

PLAIN'TIFF (OF. *plaintif*, complaining, from *plainte*, complaint, from Lat. *planctus*, lamentation, beating of the breast in grief, from *plangere*, to strike). Under the common-law system of pleading and modern codes, the person who institutes a civil action or proceeding against another, the latter being called the defendant. Where a proceeding is commenced by petition, as in a surrogate's court, the moving party is usually called the petitioner. In many jurisdictions a party commencing an action in equity is called the complainant, but under the reformed procedure no distinction of this sort is made. A plaintiff may be one who prosecutes an action on his own behalf, or who does so as a representative for the benefit of another, in which case he adds to his name a description of his official or representative capacity, as "A, guardian ad litem of B, an infant, etc."

A person who brings an action in a representative capacity is sometimes called a plaintiff ad litem. A person who maintains a proceeding or action in an admiralty court is called a libellant. See PARTIES; and consult the authorities referred to under PLEADING.

PLAINVIEW. A town and the county seat of Hale Co., Tex., about 320 miles northwest of Dallas, on the Panhandle and Sante Fe Railroad (Map: Texas, B 2). It is the seat of the Seth Ward Methodist College and the Wayland Baptist College, and it contains an Elks home, Masonic Temple, city hall, courthouse, and a sanitarium. The town is situated in a productive farming, fruit-growing, live-stock and cattle-raising region. The water works are owned by the municipality. Pop., 1910, 2829.

PLAINVILLE. A town in Hartford Co., Conn., 5 miles west by north of New Britain, on the New York, New Haven, and Hartford Railroad (Map: Connecticut, D 3). The manufacture of electrical supplies constitutes the chief industry. Pop., 1900, 2189; 1910, 2882.

PLAN (for derivation see PLANE). A diagram or drawing representing an object as if seen from directly above every part of it. Plans of buildings, ships, machinery, etc., are drawn to represent horizontal sections of the object taken at given levels, except roof plans, deck plans, etc., which represent the aspect of the uppermost surfaces as seen from above. In

architecture the various floor plans (foundation plan, cellar plan, first, second, third floor plan, etc.) show the disposition of all the supports, piers, walls, partitions, etc., as well as the arrangement and dimensions of rooms, halls, etc. Special plans are drawn to show arrangement of plumbing, ventilating apparatus and ducts, electric wiring, etc. Plans are drawn to specified scales, as $\frac{1}{8}$ of an inch to the foot, 2 centimeters to the meter, etc. For the complete presentation of the design and construction of a building, a ship, or a machine the plans are supplemented by elevations and vertical sections, and details to a larger scale.

PLANA, plā'nā, GIOVANNI ANTONIO AMEDEO, BARON (1781-1864). An Italian astronomer and mathematician, born at Voghera in Lombardy. He was educated at the Ecole Polytechnique in Paris. He held the chair of mathematics at the Alessandria artillery school from 1803 till 1811, and in the latter year became professor of astronomy at the University of Turin. In 1813 he was made director of the Turin observatory. He made numerous contributions to mathematics and astronomy, his most important works being *Memoria sulla teoria dell' attrazione degli sferoidi ellittici* (1811) and *Théorie du mouvement de la Lune* (2 vols., Turin, 1832). He was a member of the French Academy and received the grand prize in mathematics in 1820 and the Lalande medal in 1828.

PLANARIA (Neo-Lat. nom. pl., from Lat. *planarius*, flat). *A genus of platyhelminthes (flatworms) characterized by having a flat oval body covered with cilia. They live in fresh water. See FLATWORM; FLUKE; TAPEWORM; ETC.

PLANCHÉ, plān'shā', JAMES ROBINSON (1796-1880). An English playwright and antiquary, born in London, Feb. 27, 1796. He wrote for the London theatres more than 200 successful pieces. His first play was a burlesque, *Amoroso, King of Little Britain* (1818); his last was *King Christmas*, a masque (1871). He was at the height of his reputation from 1840 to 1850, when he was bringing out his burlesques and Christmas pieces for Madame Vestris at the Lyceum. Planché had already gained a reputation for his knowledge of costume and heraldry. In 1829 Planché was elected fellow of the Society of Antiquaries and in 1843 was one of the founders of the British Archaeological Society, to which he contributed many papers. In 1866 he was made Somerset herald. He died at Chelsea, May 30, 1880. Among his valuable works are *Costumes of Shakespeare's King John* (1823-25); *The History of British Costumes* (1834); *Regal Records* (1838); *The Pursuivant of Arms, or, Heraldry Founded upon Facts* (1852); *A Cyclopædia of Costume* (1876-79). In 1879 appeared *Extravaganzas* in five volumes and in 1881 *Songs and Poems*. Planché also published collections of fairy tales translated from the French and the German. Consult his *Recollections and Reflections* (London, 1872).

PLANCHE, plānsh, JEAN BAPTISTE GUSTAVE (1808-57). A French critic. He was born in Paris, was educated at the Collège Bourbon, and in 1831 began contributing to the *Revue des Deux Mondes*. He was subsequently connected with the *Journal des Débats* (1832) and was an associate of Balzac on the *Chronique de Paris*. He bitterly attacked the works of Victor Hugo and other writers of the Romantic school. His works include *Portraits littéraires* (1836), *Nou-*

veaux portraits littéraires (1854), and *Études sur les arts* (1855).

PLANCHETTE, plān'shét' (Fr., little board). A small triangular board mounted on two wheels, with a pencil fastened at the apex to form the third support. If it is placed upon a table with a sheet of paper under it, and if one or two persons with the necessary qualifications lay their hands lightly upon it, it begins to move and sometimes may write answers to questions. These answers are asserted by believers in spiritualism to be communications from the spirit world.

PLANCK, plāpk, KARL CHRISTIAN (1819-80). A German philosopher, born at Stuttgart and educated in philosophy and theology in Tübingen. In 1844 he became tutor and librarian at the theological seminary there and lecturer on philosophy at the university. From 1856 to 1869 he was professor at the Gymnasium of Ulm, and in 1879 he became principal of the seminary in Maulbronn. Planck defends in his numerous writings the speculative system of philosophy as opposed to that of empiricism. His chief work is *Die Weltalter* (1850), in which he treats of the system of pure realism and subjective idealism. His *Katechismus des Rechts* (1852) is one of the first philosophical books to acknowledge the importance of the social question. In his *Wahrheit und Flachheit des Darwinismus* (1872) he takes his stand against Darwin's theory of evolution, and in *Anthropologie und Psychologie auf naturwissenschaftlicher Grundlage* (1874) he vigorously combats the theories of the atomists and materialists.

PLANCK, MAX (1858-). A German physicist, born in Kiel and educated at the universities of Munich and Berlin. He became docent at Munich in 1880, professor at Kiel in 1885 and in 1889 at Berlin, where he was later appointed professor of mathematical physics and director of the Institute of Theoretical Physics. In 1913-14 he was rector of the university. His great work was in theoretical physics, especially energetics and thermodynamics, and his name is connected with a radiation (q.v.) formula and with the theory of a quantum of energy, viz., that energy is "not emitted continuously but in discrete atomic quantities." He wrote, among other works: *Das Prinzip der Erhaltung der Energie* (1887; 3d ed., 1913); *Vorlesungen über Thermodynamik* (1897; 4th ed., 1913; Eng. version by Ogg, 1903; Fr., 1913; Russ., 1900); *Vorlesungen über Theorie der Wärmestrahlung* (1906; 2d ed., 1913; Eng. version, 1914); *Vorlesungen über theoretische Physik* (1910; lectures delivered in 1909 at Columbia University). He edited some of Kirchhoff's and Helmholtz's writings for Ostwald's *Klassiker der exakten Wissenschaften*.

PLANCK'S LAW. See RADIATION.

PLANÇON, plān'sōn', POL (1854-1914). A French basso, born at Fumay in the Ardennes. He was sent to Paris by his parents and there, despite his own inclinations, entered a business house. Through the friendship of Theodor Ritter he was enabled to study music and finally entered the École Duprez and devoted himself entirely to music. In 1881 he made his début in *Les Huguenots* at Lyons. Two years later he appeared at the Paris Grand Opéra as Mephisto in *Faust*, in which rôle, as well as that of Ramfis in Verdi's *Aida*, his success was pro-

nounced. He created the rôles in Saint-Saëns's *Ascanion*, in Massenet's *Le Cid*, and in Gounod's *Sapho*, upon its revival in 1893. From 1893 to 1904 he was a member of the Metropolitan Opera House in New York, where he was a prime favorite. He died in Paris.

PLAN'CUS, LUCIUS MUNATIUS. A Roman politician and soldier. He was born at Tibur, near Rome. In youth he was one of Cicero's pupils in oratory and later was an officer of Cæsar in the Gallic wars. After the assassination of Cæsar Plancus at first favored Brutus, but soon went over with four legions to Antonius. In 42 B.C. he was consul with Lepidus. In the contest between Antonius and Octavianus he sided with the latter and in January, 27 B.C., made the motions as the result of which in the Senate the title of Augustus was conferred on Octavianus. Plancus was a man of some literary taste, and to him one of Horace's odes (i, 7) is addressed.

PLANE (Lat. *planum*, level ground, plain, neut. sing. of *planus*, level, flat, plane, plain). A surface which is determined by any three of its points not in a straight line. It may also be defined as a surface such that a straight line placed anywhere upon it will lie wholly within it, or as a surface described by a straight line which passes through a fixed point and always touches (crosses) a fixed straight line. A plane surface is said to have zero curvature. When two planes intersect their intersection is a straight line. The inclination of one plane to another, or the dihedral angle (see ANGLE) between the planes, is measured by the plane angle whose arms lie in the respective planes and are perpendicular to their intersection. When this angle is a right angle the planes are perpendicular to each other. As a result of the definition, a plane is determined by a straight line and a point not in that line, or by two intersecting lines or by two parallels. A group of several planes having a common line of intersection is called an axial pencil. Several planes with a common point of intersection are called a sheaf of planes.

Plane Figures. Any combination of coplanar points and lines is called a plane figure. See POLYGON.

PLANE (OF., Fr. *plane*, from Lat. *platanus*, from Gk. *πλάτανος*, plane tree, from *πλατύς*, *platys*, flat, Lith. *platus*, Skt. *prthu*, broad, from *prath*, to spread out; so called from the broad flat leaves), *Platanus*. The only genus of the family *Platanaceæ*, tall large trees, of which there are six or seven species. The flowers are in globose, small, pendulous, long-stalked catkins, which give the tree a peculiar appearance in winter. The species of plane are natives of temperate climates in the Northern Hemisphere; have deciduous large palmate leaves and smooth whitish bark, which annually scales off in large pieces. The Oriental plane (*Platanus orientalis*), a native of Greece and the East, early used by the Greeks and the Romans as an ornamental tree, is extensively planted for shade and ornament in various regions. Few trees better endure the atmosphere of large cities. A tree is reported on the banks of the Bosphorus, which is 141 feet in circumference at the base, extends its branches 45 feet from the trunk, and is believed to be more than 2000 years old. The wood of the plane, when young, is yellowish white; when old, it is brownish, fine-grained, takes a high polish, and is esteemed for cabinet-

making. The tree thrives best in a rich alluvial soil in the vicinity of water. The North American plane, sycamore or buttonwood (*Platanus occidentalis*), is very similar and is probably the largest deciduous tree of the United States. It abounds on the banks of the great rivers

PLANE TREE OR BUTTONWOOD.

of the Middle States, where it attains a height of 100-150 feet and 10-15 feet in diameter. Its timber is not very valuable and is liable to decay. Two other species occur in the Southwest, the Californian sycamore (*Platanus racemosa*) and the Arizona sycamore (*Platanus wrightii*). The name "plane tree" is commonly given in Scotland to the sycamore or great maple (*Acer pseudo-platanus*), which resembles the plane tree in its foliage. See MAPLE.

PLANE (Fr. *plane*, from ML. *plana*, plane, from Lat. *planare*, to plane, level, from *planus*, level, flat, plane, plain). A tool used for rendering the surface of wood smooth and level. It consists of an oblong block of wood or metal with an opening through the centre; this opening is square on the upper side and is always large enough to admit the cutting instrument; it diminishes down to a mere slit on the underside, just wide enough to allow the cutting edge of the plane iron and the shaving of wood which it cuts off to pass through. The essential part of the tool is the plane iron, a piece of steel with a chisel-shaped edge and a slot in its centre for a large-headed screw to work and to attach to it a strengthening plate. In the older wooden planes it was held in place by a hardwood wedge. By driving in the wedge the irons are held very firmly in their place, and they are so adjusted that only the fine sharp chisel edge of the cutting tool projects through the slit in the bottom of the body of the plane, so that when the tool is pushed forward by the force of the hand the cutting edge pares off all irregularities until the wood is as smooth as the undersurface of the plane. In the iron planes the iron is held in the block and adjusted by a screw. There are many modifications in this tool, which can have its cutting edge and undersurface made to almost any contour, so that moldings of all kinds may be made. The two commonest are the jack plane, for rough work, and the smoothing plane, for finishing off plane surfaces. For planing machines, see METAL-WORKING MACHINERY; WOOD-WORKING MACHINERY.

PLANE CURVE. See CURVE.

PLANE OF CLEAVAGE. See CLEAVAGE OF CRYSTALS.

PLANE OF POLARIZATION. See LIGHT.

PLANNER TREE, or WATER ELM (named in honor of J. S. Planer, a German botanist of the eighteenth century). A moderate-sized elm-like tree (*Planera aquatica*), found on swampy lands from North Carolina to southern Indiana, Missouri, and south to Florida and Texas. The wood is soft, close-grained, and not strong.

PLANE SAILING. See SAILINGS.

PLANE TABLE. An instrument used to fill in the details of topographical work (see SURVEYING), and, on account of the ease and rapidity with which it can be operated, popular where only a moderate approach to accuracy is required. The plane table consists essentially of a mounted drawing board bearing an alidade or ruler surmounted by a telescope whose line of sight is parallel in azimuth to the ruler. In orienting the table a declinator, or compass box, and a plumbing arm serve to place a given point on the table over that on the ground which it represents and to cause a line of the drawing on a paper mounted on the board to lie in or parallel to the vertical plane through its counterpart on the ground. After the paper has been attached to the table it is then leveled and oriented as already described. The observer then sights successively at other different objects in the area under survey, revolving the telescope and ruler in azimuth and drawing corresponding lines along the edge of the ruler at each position. All of these lines pass through the given point and give the angular direction of the different objects in the field. The plane table is then taken to a second station located at some place previously sighted and whose distance from the first can be measured by stadia, chain, or tape, and is there set up and oriented as before. The distance from the first station to the second is set off at the desired scale on the line connecting the two points, and the telescope is directed at the same objects as were sighted at from the first station, as well as

PLANE TABLE.

others not visible from the first point, and new lines are ruled. The instrument is then taken to other points which are given by the intersection of the various lines ruled on the paper, and the positions of the various objects in the area under survey are determined. In this

way it is possible to fill in the detail work of a topographical survey with great rapidity and sufficient exactness for most map work. Consult: "Plane Table Manual," in *United States Coast and Geodetic Survey, Report* (Washington, 1897); H. S. Gannett, "Manual of Topographic Methods," in *United States Geological Survey, Bulletin 307* (ib., 1906); H. M. Wilson, *Topographic Surveying* (3d ed., New York, 1910); Johnson and Smith, *Theory and Practice of Surveying* (17th ed., ib., 1911). See SURVEYING.

PLAN'ETARIUM (Neo-Lat., from Lat. *planeta*, from Gk. *πλανήτης*, *planētēs*, wanderer, wandering star, planet, from *πλανήs*, *planēs*, wanderer, planet, from *πλάνη*, *planē*, a wandering; connected with Lith. *plónas*, thin, Lat. *planus*, level, flat, plane, plain). A machine much employed by astronomers in the seventeenth and eighteenth centuries and first constructed by Huygens and Römer for the purpose of exhibiting clearly the motion of the heavenly bodies in conformity with the Copernican doctrine. The planetarium exhibited only the orbital motions of the planets about the sun, either in circles or ellipses, and with constant or varying motions, according to the perfection of the machine.

PLAN'ETARY GEAR, IN MOTOR VEHICLE. See MOTOR VEHICLE.

PLAN'ETES'IMAL HYPOTHESIS. See COSMOGONY.

PLAN'ETOIDS (from Gk. *πλανήτης*, *planētēs*, wanderer, wandering star, planet + *εἶδος*, *eidos*, form), or **ASTEROIDS**. A numerous group of very small planets which with one exception travel in orbits lying between those of Mars and Jupiter. Till the first year of the nineteenth century they remained undiscovered, but for several years their existence had been suspected, mainly owing to the remarkable hiatus in the series of the planetary distances when compared with the law of Bode (q.v.). On the first day of January, 1801, the first and largest of them, Ceres, was detected by Piazzi at Palermo, and his success roused the astronomers to search for more planets. Their search was successful, for Olbers (q.v.) discovered two, Pallas and Vesta, in 1802 and 1807 respectively, and Harding found Juno in 1804; but as all researches for some time subsequent to 1807 were unavailing, astronomers gradually allowed themselves to settle down into the belief that no more planetoids remained to be discovered, when the detection of Astræa by Hencke in 1845 revived the hope of fresh discoveries, and from this period no year (excepting 1846) has passed without adding to the list. And since the application of photographic processes to observation, the number known to astronomers has increased with great rapidity. The first photographic planetoid was found by Wolf, of Heidelberg, Germany, in 1891, and was named by him Brucia, in honor of Katharine W. Bruce, who contributed to the Heidelberg observatory. Brucia received the number 323 in the list of planetoids. The photographic method of discovery is very simple. The camera carrying the sensitive plate is attached to an equatorial telescope and is thus kept pointed at a particular part of the heavens during the necessary lengthy time of exposure. Consequently the stars in the field are registered on the plate as points, while the planetoids, which have shifted their positions among the stars during the exposure,

plate. An important modification in technique was introduced by the Rev. Joel Metcalf, of Winchester, Mass., who, by giving an additional motion to the camera, secured point images of the planetoids and trail images of the stars. On account of the large number of planetoids which are reported as new every year, it has been customary since 1892 to designate them provisionally at first by the letters AA, AB to AZ, BA, etc. to ZZ, preceded by the number of the year. As soon as the elements of its orbit have been calculated and it is quite certain that it is not one of those already known, the planetoid is given a number and sooner or later a name. Photography has now almost completely replaced the visual telescope in the observation of planetoids. Since 1892 only a few planetoids have been found visually, though the total in the list has been extended from 322 to over 800.

The magnitudes of the planetoids have not been very accurately ascertained, but it is certain that they are exceedingly small compared even with Mercury, the smallest of the other planets, the diameter of the largest among them having been measured by Barnard as 480 miles, while most of the others are very much smaller than this. They also differ, generally speaking, from the rest of the planets in other respects; their orbits are of greater eccentricity, are inclined to the ecliptic at a greater angle, and are interlaced in a most intricate manner, crossing each other so frequently as to form, when viewed perpendicularly, a kind of network. The orbit of 475 Oeclo is 0.38, or nearly double that of Mercury, while the average eccentricity for the whole family is more than twice that of the orbits of the major planets. The inclinations of their orbits to the ecliptic also vary considerably; the greatest is 34° 42', in the case of Pallas, while more than 30 per cent exceed 20°.

The distribution of the planetoids in the belt which they occupy between the orbits of Mars and Jupiter is far from uniform. Several marked gaps are found, and it was first pointed out by Kirkwood that they occur where the period of a planetoid would be an exact fraction of the period of Jupiter, to whose perturbative action they are doubtless due. After the first two or three of these bodies had been discovered the opinion was propounded by Olbers that they were but the fragments of some large planet, and this hypothesis received corroboration from the intimate connection which was shown to subsist among them; but this hypothesis is now rejected by most astronomers, and their existence is explained by the nebular hypothesis. See NEBULÆ.

Decidedly the most interesting planetoid is the one discovered Aug. 13, 1898, by Witt of Berlin, which has received the number 433 and the name Eros (q.v.). This small planet possesses the remarkable orbital peculiarity that at perihelion it passes considerably within the orbit of Mars and thus approaches the earth nearer than any other known body except the moon and is therefore especially well suited for the determination of solar parallax by the planetoid method. See ASTRONOMY; PARALLAX.

PLAN'ETS (for derivation see the article PLANETARIUM). Those solid spherical bodies which belong to our solar system and revolve in elliptic orbits round the sun. The name "planet" is of considerable antiquity and was applied to these dependents of the sun to dis-

which stud the sky and present to the naked eye no indication of change of relative place (see STARS), while the planets seem to wander about among them. The planets at present known are, in the order of their distance from the sun, Mercury, Venus, the earth, Mars, the planetoids, Jupiter, Saturn, Uranus, and Neptune. Six of these, Mercury, Venus, the earth (which was not, however, then reckoned a planet), Mars, Jupiter, and Saturn, were known to the ancients; Uranus was discovered by Sir William Herschel (q.v.) in 1781; and Neptune, after having its position and elements determined theoretically by Leverrier and Adams, was discovered by Galle in 1846. The planetoids, of which over 800 are now known, have all been discovered since Jan. 1, 1801. Six of the planets, the earth, Mars, Jupiter, Saturn, Uranus, and Neptune, are attended by one or more satellites. Uranus (generally), Neptune, almost all the planetoids, and all the satellites except our moon, are invisible to the naked eye. The visible planets can be at once distinguished from the fixed stars by their clear, steady light, while the latter have a sparkling or twinkling appearance. The comparative proximity of the planets may be proved by examining them through a telescope of moderate power, when they appear as round luminous disks, while the fixed stars show as mere points of light even in the most powerful telescopes. The planets as observed from the earth move sometimes from west to east, sometimes from east to west, and at times remain stationary at the point where the apparent motion changes from the one direction to the other. This irregularity in their movements was very puzzling to the ancient astronomers, who invented various hypotheses to account for it. (See PROLEMAIC SYSTEM; EPICYCLE.) The system of Copernicus, by assuming the sun, and not the earth, as the centre of the system, explained with admirable simplicity what seemed before a maze of confusion, by showing that the planetary *apparent* motions are merely a result of real motions belonging to the planets in general and to the earth carrying the observer.

The planetary orbits differ considerably in their degrees of eccentricity, those of Mars, Mercury, and many of the planetoids being most, and those of the larger planets least, eccentric. No two planets move exactly in the same plane, though, as a general rule, the planes of the larger planets most nearly coincide with that of the ecliptic. The latter are consequently always to be found within a small strip of the heavens extending on both sides of the ecliptic (q.v.), while the others have a far wider range. Pallas, one of the planetoids, has an angular elevation of orbit equal to $34^{\circ} 42'$ above the ecliptic. According to Kepler's laws (see ASTRONOMY), the nearer a planet is to the sun the shorter is the time of revolution. The arrangement of the planets in the solar system bears no known relation to their relative size or weight, for though Mercury, Venus, and the earth follow the same order in size and distance from the sun, yet Mars, which is farther from the sun, is much smaller than either the earth or Venus; and the planetoids, which are still farther off, are the smallest of all. Jupiter, which is next in order, is by far the largest, being about one and one-half times as large as all the others together; and as we proceed farther outward the planets become smaller and smaller.

With reference to their distance from the sun, as compared with that of the earth, the planets are divided into *superior* and *inferior*; Mercury and Venus are consequently the only inferior planets, all the others being superior. The inferior planets must always be on the same side of the earth as the sun is and can never be above the horizon of any place (not in a very high latitude) at midnight; they are always invisible at their superior and inferior conjunctions, except when, at the latter, a transit (see TRANSIT OF VENUS) takes place. The superior planets are likewise invisible at conjunction, but when in opposition they are seen with the greatest distinctness, being then due south at midnight.

In 1859 Leverrier put forward the hypothesis of an intra-Mercurial planet in order to explain the advance of the perihelion of Mercury, and the name Vulcan (q.v.) was assigned to it. Although its discovery has been reported several times, the most careful photographic search during recent solar eclipses has failed to confirm its existence. At the other extreme of the solar system the existence of one or more planets revolving outside the orbit of Neptune has been suggested to account for certain perturbations of Uranus and Neptune which cannot be attributed to the known members of the solar system. Even before the discovery of Neptune it was suggested that the Uranian disturbances were not due to a single exterior planet alone. Todd, Pickering (qq.v.), and others have investigated the question and have even computed the masses and distances of these ultra-Neptunian planets, but every effort to find them has so far proved fruitless.

In astronomical tables, almanacs, etc., the planets are for convenience denoted by symbols instead of their names, as follows: Mercury, ☿; Venus, ♀; the earth, ♂; Mars, ♂; the planetoids, in the order of their discovery, ①, ②, ③, etc.; Jupiter, ♃; Saturn, ♄; Uranus, ♅; Neptune, ♆; the sun, ☉; the moon, ☾.

For a table of the periods, distances, size, density, etc., of the planets, see SOLAR SYSTEM. See also the several planets under their respective names. For the elements necessary to determine the orbit of a planet, see ORBIT. For theories regarding the origin of the system, see COSMOGONY; NEBULÆ.

Serviss, *Other Worlds* (ib., 1901); Percival Lowell, *The Solar System* (Boston, 1903); C. L. Poor, *The Solar System* (New York, 1908); R. S. Ball, *Story of the Heavens* (ib., 1910); Harold Jacoby, *Astronomy* (ib., 1913).

PLANIMETER (from Lat. *planum*, level ground, plain + Gk. *μέτρον*, *metron*, measure). An instrument for automatically measuring the areas of maps and plans. The first usable planimeter seems to have been constructed in 1814 by a Bavarian engineer named Hermann (1785-1841). This was followed by an ingenious device invented by a Swiss engineer, Oepikoff, in 1827 and perfected 10 years later by Ernst of Paris. The next notable type was the polar planimeter made by the firm of Amsler-Laffon of Schaffhausen (1854) and known as Amsler's planimeter. This well-known instrument consists of two arms hinged at one end, the outer end of one being a pointed support and that of the other a tracing pencil. The

latter arm also bears a graduated cylinder which rolls on the paper, its axis being parallel to the arm. To obtain the area of a figure the instrument is moved bodily about the pointed support on the first arm, while the tracer of the other arm describes the perimeter of the area, and the graduated cylinder records the required area. This and the Wetliische linear planimeter, manufactured in Vienna, are the best planimeters now made. The mathematical principles involved may be found in works on surveying. The best description of the Amsler planimeter is given in C. M. von Bauernfeind, *Elemente der Vermessungskunde* (7th ed., Stuttgart, 1890). Consult also Amsler, *Ueber die mechanische Bestimmung des Flächeninhalts* (Schaffhausen, 1856). The latest improvements on the polar planimeter have been made by Hohmann and Coradi in their Präzisions-Polarplanimeter and by Coradi in his Kugel-Rollplanimeter, on which consult *Das Momentenplanimeter* (Zürich, 1875); Lorber, in *Zeitschrift für Vermessungswesen*, vols. viii and xvii (Stuttgart, 1884-88); Amsler-Laffon, "Planimeterkonstruktionen," in the *Zeitschrift für Instrumentenkunde*, vol. iv (Berlin, 1884). For the history of the subject, consult Christopher Trunk, *Die Planimeter; deren Theorie, Praxis und Geschichte* (Halle, 1865), and Favaro, in the *Allgemeine Bauzeitung* (Vienna, 1873).

PLANIMETRY (from Lat. *planum*, level ground, plain + Gk. *-metra*, *-metria*, measurement, from μέτρον, *metron*, measure). That portion of geometry which treats of the measurement of plane areas. See MENSURATION; PLANIMETER.

PLANING MACHINE, or **PLANER**. See METAL-WORKING MACHINERY; WOOD-WORKING MACHINERY.

PLANKTON (Neo-Lat., from Gk. *πλαγκτός*, *planktos*, wandering, from *πλάειν*, *plazein*, to wander). A collective term for the free floating or swimming organisms in oceans, lakes, or rivers. The oceanic plankton is more interesting and important than that of lakes and of rivers, inasmuch as it forms the basis for all oceanic life. Among the more important forms which are found in the plant plankton are blue-green algæ, bacteria, and diatoms. The colors of certain waters are due to plankton organisms. For example, the Red Sea is colored by a red alga. Diatoms are found in especial abundance in the colder seas. Among the more interesting structures and life habits of the plankton plants there may be noted a high development of adaptations for active movements through the water, a type of structure which is found in plants only among the lower forms. Another very striking feature of the plankton is its periodicity; at various seasons its constitution varies widely and the plankton organisms are known to rise and sink more or less periodically. The mechanism involved in these movements is not known.

In zoölogy the term is restricted to the pelagic life which drifts, the actively swimming surface forms constituting a separate assemblage—the nekton. It consists mainly of jellyfishes (Medusa, Siphonophora, and Ctenophora), ascidian, especially the salpæ (q.v.), and a great variety of pelagic larvæ and minute crustacea with feeble powers of locomotion that are carried along almost passively by the oceanic currents. Much of this occurs in innumerable flocks and sometimes tinges large areas of the sea by its color or causes them to glow with phosphores-

cence, and it furnishes food to many surface-feeding pelagic animals. Consult California University, Scripps Institute for Biological Research, *Hydrographic Plankton and Dredging Records, 1901-1912* (Berkeley, 1915). See PALEONTOLOGY.

PLANORBIS (Neo-Lat., from Lat. *planus*, level + *orbis*, circle). A genus of pulmonate gastropods with discoidal shell of many whorls, remarkable for its racial longevity. It appears first in Lower Jurassic time, becomes very profuse in the Tertiary, and is still to-day in a flourishing condition.

PLANQUETTE, plän'kët', ROBERT (1850-1903). A French composer of light opera, born in Paris. He studied at the Paris Conservatory and wrote at first mediocre songs. His success came with his adoption of the *Musiquette*, a genre in which he wrote 16 very successful operettas between 1873 and 1892, one of those best known in America and England being *Les cloches de Corneville* (1877), also known as *The Chimes of Normandy*. Others scarcely less popular are *Nell Gwynne* (1884), *La crémaillère* (1885), and *The Old Guard* (1887), written for the English stage. A posthumous work, *Le paradis de Mahomet*, was brought out in Paris in 1906. His music is light and graceful and thoroughly representative of the school which claims as its exponents Lecocq, Audran, Serpette, Banès, Vasseur, and Victor Roger.

PLANT. See PHYSIOLOGY OF PLANTS; MORPHOLOGY.

PLANT, MORTON F. (1852-). An American financier and philanthropist. He was born at New Haven, Conn., where he was educated at Russell's Military School. In 1868, at Memphis, Tenn., he entered the employment of the Southern Express Company, of whose board of directors he eventually became president. By 1884 he was vice president of a group of railroads known as the Plant System. This office he continued to hold until 1902, when the group became part of the Atlantic Coast Line. Plant served as vice president and director of the Chicago, Indianapolis, and Louisville Railway and of the Peninsula and Occidental Steamship Company, and as director of the New York, New Haven, and Hartford (until 1914) and of the Atlantic Coast Line. He became much interested in the project to establish the Connecticut College for Women at New London (opened 1915), contributing \$1,125,000 of its \$1,500,000 endowment and giving in addition two dormitories.

PLANTAGENET, plän-tāj'ê-nët. A royal house of England which succeeded to the throne in 1154 in the person of Henry, son of Geoffrey, Count of Anjou, and Matilda, daughter of Henry I (see HENRY II), and ruled in the direct male line till 1399. The name of Plantagenet is commonly said to have been applied to Geoffrey of Anjou from his habit of wearing sprigs of broom (*planta genesta*) in his cap. The house gave to England some of its ablest rulers, and the period of the later Plantagenets especially is important for the development of the Parliament and the determination of the general character of English constitutional growth. The monarchs of this line were: HENRY II (1154-89); RICHARD I (1189-99); JOHN (1199-1216); HENRY III (1216-72); EDWARD I (1272-1307); EDWARD II (1307-27); EDWARD III (1327-77); RICHARD II (1377-99). With the death of the childless Richard II in 1399 the crown passed to the house of Lancaster (q.v.), descended from John of

Gaunt, fourth son of Edward III, and therefore in reality a branch of the house of Plantagenet. The Lancastrian monarchs were forced to contend against the claims of the house of York (q.v.), similarly descended from a son of Edward III. (See also ROSES, WARS OF THE.) The line of York attained the throne in the person of Edward IV (1461-83), but with the death of his brother, Richard III (1483-85), the crown passed to the house of Tudor (q.v.). Consult Hubert Hall, *Court Life under the Plantagenets* (New York, 1902), and T. F. Tout, *History of England, 1216-1377* (ib., 1905).

PLANTAGENET, JOHN. See BEDFORD, JOHN PLANTAGENET, DUKE OF.

PLANTAIN (OF., Fr. *plantain*, from Lat. *plantago*, plantain; connected with *planta*, plant), COOKING BANANA, ADAM'S FIG (*Musa paradisica*). An herb of the family Musaceæ, widely cultivated in the tropics for its fruits, which resemble those of the banana, but are less sweet and less pleasant to eat uncooked. It is one of the most important of tropical fruits, since a very large part of the human race use it as a principal food. In habit of growth it resembles the banana (q.v.). The name "plantain" is also given to the genus *Plantago* of the family Plantaginaceæ. There are 100 or more species of wide distribution, practically all of which are weeds, though in dry climates some are valuable as forage plants. *Cacalia reniformis*, a plant belonging to the Compositæ, is called Indian plantain. The species of *Alisma* are called water plantain. Consult E. L. Morris, "North American Plantaginaceæ," in Torrey Botanical Club, *Bulletin*, vols. xxvii, xxviii, xxxvi (New York, 1900-09).

PLANTAIN EATER. Either of two West African birds of the turaco family, Musophagidæ, which have serrated bills and feed on fruits, especially that of the banana tree. Both are birds of the size of a crow, are handsomely colored, and form the genus *Musophaga*. The name is sometimes extended to various other genera. See TURACO.

PLANT BREEDING. The art of improving plants by crossing and selection. In general plants tend to reproduce their main characters unchanged, but their long-recognized tendency to vary has prompted much experimentation, which, with the undirected variation, has resulted in the production of many cultivated varieties, strains, and races. In some cases the variation appears on a part of a single individual and can be traced to no apparent cause. Such variations are usually called sports, and, when desired, are propagated by artificial asexual methods, which consist of the indefinite propagation of a single individual by cuttings, grafts, layers, etc. This method is one of the simplest and in some respects the surest method of plant breeding, since as a rule sports are less plastic than other variant forms. The principal objection raised against the method is the weakness supposed to follow long-continued asexual propagation. Familiar examples of this type of breeding are the weeping willows and elms, cut-leaved birches and maples, variegated foliage plants, etc. Selection, a second method, consists in the saving of seed from only such individuals as exhibit qualities not possessed by all, undesirable forms being destroyed. Plants grown from seed tend to vary greatly because of the action of diverse factors. As with many varieties of grapes, apples, and other fruits, some seedling may exhibit sufficient

merit to be propagated without further selection by the asexual methods mentioned. Usually, however, the progeny shows only a slight improvement over the parent plant, and selection must be continued until the ideal is approximated or an improvement secured that is worth commercial introduction.

Associated with selection, and in many cases preliminary to it, is fertilization, which may result from the transportation of pollen by wind or insects in a natural cross, as in numerous hybrids of oak, willow, etc., occurring in nature. Or there may be an artificial transfer of pollen for a definite purpose. Variations are often introduced by this means and the desirable variant propagated and improved by long-continued selection. Since Darwin's time the superabundant nutrition of plants has been held to be a prominent cause of variation. A large part of the work of improving sugar beets, potatoes, tomatoes, cereals, etc., has been along these lines. The usual method of artificial pollination is to remove the immature stamens from the flower to be fertilized unless the pistil is known to be sterile to pollen of the same variety of plant. When the stigmas of the emasculated flower are ripe, pollen from a related plant is placed upon them and the flower covered with fine gauze or a paper bag to prevent an accidental application of other pollen. When the fruits or seeds are mature they are collected, and are planted when the usual season for planting arrives. From the progeny of such a fertilization individuals that differ from both parents are selected as the basis of new varieties. When a desirable form is found it is subjected to further cultivation and selection, attention being given to keep the selection always along one line, since any deviation will likely result in the ultimate failure of the experiment. In making selections the individual plant and not any particular portion of it must be the unit of selection. In following out this improvement thousands of individuals will probably have to be discarded. It is said that an American carnation grower destroyed more than 60,000 plants that he had reared to flowering to secure a single new desirable variety.

In plant breeding the following principles are laid down: thorough knowledge of the plant, a preconceived ideal established and maintained throughout, the employment of large numbers of seedlings in all selection experiments, and the selection of fixed characters as far as possible. A knowledge of the following correlations will aid the plant breeder: small foliage is usually associated with small fruit; dwarf seedlings produce poor plants; pale-colored foliage is usually an accompaniment of light-colored fruit, flowers, etc.; large individuals are incompatible with numerous specimens, great productiveness with extreme earliness, and very great size with intense coloration. By paying attention to these principles a skillful plant breeder can influence almost at will the external characters of form and color and the internal qualities of flavor, perfume, and, to some extent, chemical composition. It is quite as possible, however, for varieties to degenerate under selection as to improve, and this fact shows the importance of making the proper selection and constantly keeping it in mind in subsequent selections.

Bibliography. *Transactions of the International Conference on Plant Breeding* (New York, 1902), and a brief abstract of them in *Experiment Station Record*, xiv (Washington, 1903).

A third conference was held in London in 1906 and the fourth in Paris in 1912. For further information, see *New Jersey Experiment Station Report for 1901* (Trenton, 1902), in which the plant-breeding work of the American Experiment Stations is summarized; United States Department of Agriculture *Year Books* (Washington, 1897-99); Hugo De Vries, *Die Mutations Theorie* (Leipzig, 1901; Eng. trans., 2 vols., Chicago, 1900-11); H. Bailey, *Plant Breeding*, new edition, revised by A. W. Gilbert (ib., 1915). The following periodicals are largely devoted to plant breeding: *Journal of Heredity* (Washington); *Journal of Genetics* (Cambridge); *Zeitschrift für Pflanzenzüchtung* (Berlin); *Zeitschrift für induktive Abstammungs- und Vererbungslehre* (ib.). See BREEDING, *Plant Breeding*.

PLANT BUG. Any one of several families of true bugs, which feed upon plants by extracting the sap through the beaks. The Coreidae are a very large and important family, containing more than 1500 species. The squash bug (see SQUASH INSECTS) is a representative of this group, as also is the box-elder plant bug (*Leptocoris trivittata*), a species which frequently damages the box-elder trees that, because of their rapid growth, are commonly planted on Western tree claims. The Pyrrhocoridae are a much smaller group, but include several well-known species. The red bug or cotton stainer, which does considerable damage to cotton in Florida, as well as to the orange groves, is a prominent example. The family Lygaeidae is another of the largest families of plant bugs, comprising more than 1300 species distributed in 13 subfamilies and 208 genera. About 175 species are known in the United States. The most prominent member of this family is the chinch bug (q.v.). The bordered plant bug (*Stiretus anchorago*) is a brilliant species which preys on the larvæ of the Colorado potato beetle and is sometimes called the potato-bug enemy. Consult: V. L. Kellogg, *American Insects* (New York, 1908); J. H. Comstock, *Manual for the Study of Insects* (8th ed., Ithaca, 1909); L. O. Howard, *The Insect Book* (new ed., New York, 1914). See COTTON INSECTS; and Colored Plate of INSECTS.

PLANT CUTTER. One of the tanager-like birds, related to the cotingas (see COTINGA) and the American flycatchers. They constitute a small family (Phytotomidae), and show some remarkable anatomical peculiarities. The bill is short, strong, conical, with lateral margins finely serrated. The intestine is short, an unusual condition in vegetable-eating birds. They live in pairs or in small flocks and commit depredations in orchards and gardens by cutting off plants, buds, and fruits. They also catch insects. There are three species, all natives of temperate South America, the best-known of which is the rara (*Phytotoma rara*) of Chile, of the size of the common thrush and of reddish brown and white plumage. It has a short low flight and a dis-

agreeable rough note. See Plate of COTINGAS, ETC.

PLANT GEOGRAPHY. See DISTRIBUTION OF PLANTS.

PLANTIGRADE ANIMALS (from Lat. *planta*, sole of the foot + *gradi*, to walk). Animals that have the foot so formed that the whole sole touches the ground in walking. Man and the bear are examples. The term is used in opposition to digitigrade, or walking on the tips of the toes, like the horse and the dog. Between plantigrade and digitigrade animals all sorts of gradations intervene.

PLANTIN, plän'tän', CHRISTOPHE (1514-89). An eminent French bookbinder, printer, and publisher, born at Mont-Louis, near Tours. In 1555 he set up at Antwerp a printing establishment which soon became one of the most celebrated of the time. The most noted of all his publications is the *Biblia Regia* (8 vols., 1568-73). (See POLYGLOT.) His books were noted for the accuracy of their text and the beauty of their typography and embellishments. In 1571 he became court printer of Philip II of Spain, and amassed a fortune, which he lost through his polyglot Bible. He left a catalogue of the books printed in his establishment. See PLANTIN-MORETUS, MUSÉE. Consult Debacker and Ruelens, *Annales Plantiniennes, 1555-89* (Paris, 1865), and the *Life* by Roose (Antwerp, 1892).

PLANTIN-MORETUS, plän'tän'-mò-rä'tus, MUSÉE. An important museum in Antwerp containing a rare collection illustrating the art of printing and named for Christophe Plantin (q.v.) and his son-in-law and successor, Moretus. Plantin's printing office after 1579 was carried on in the present building until 1875, when the house with its contents was purchased by the city. The museum includes interesting apparatus and specimens of ancient work, and the residence of Plantin, with antique tapestry, furniture, paintings, and porcelains.

PLANT LOUSE. See APHID; JUMPING PLANT LOUSE; WOOLLY APHIDS.

PLANT PATHOLOGY. The study of the diseases of plants. Theoretically any interference with the normal activities of the plant may be called a plant disease. In practice, however, plant pathology has thus far been restricted chiefly to the diseases of plants induced by parasitic fungi and, in fact, to diseased plants of economic importance. The great losses due to these diseases are indicated by the fact that the United States in connection with its Department of Agriculture has an extensive organization for the study of plant diseases. Much of this study has been directed to investigations of the life histories of the parasites in order to discover methods of disease control. In recent years increasing attention is being given to the abnormal physiology of the attacked plant, i.e., the reaction of the host plant to the presence of the disease-producing parasite itself. All diseases can be referred to three categories, each with its own symptoms, as follows: (1) parasites immediately destructive, in which case the protoplast (living cell) is destroyed at once; (2) parasites that enter into symbiotic relationships with the protoplasts of the host, resulting often in the abnormal growths called hypertrophies; (3) parasites which invade the water-conducting wood vessels, thus interfering with the water supply, and producing such diseases as the various wilts. The methods of control are

various, but the one best developed is the use of fungicides (see FUNGICIDE), which in many cases has proved effective. The most hopeful method, however, is the breeding of disease-resistant races, and the permitting of susceptible races to disappear. See FUNGI.

Bibliography. Duggar, *Fungous Diseases of Plants* (Boston, 1909); Stevens, *The Fungi Which Cause Plant Disease* (New York, 1913).

PLANT PHYSIOLOGY. The study of the functions of plant organs. See PHYSIOLOGY OF PLANTS.

PLANTS (AS. *plante*, from Lat. *planta*, plant). In law, specifically, such vegetable growths as are not included in the terms "emblemments," "crops," or "growing trees," except nursery trees. The term includes bushes, shrubs, and nursery trees. Where plants are set out by a landlord they become part of the real estate and cannot be removed by a tenant, although he may alter the position of them, or remove a reasonable number of them in the ordinary course of husbandry during his term. Where a tenant sets out plants they become attached to the real estate as an integral part thereof, and are not removable by him unless they are for the purpose of temporary growth and sale, as the trees and other plants in a nursery. For example, a tenant could not remove, at the termination of his lease, berry bushes which were intended to produce annual crops, although he had set them out at his own expense. See EMBLEMENTS; FIXTURES; LANDLORD AND TENANT.

PLANTS, ALPINE. See ALPINE PLANT.

PLANTS, ANATOMY OF. See MORPHOLOGY.

PLANTS, BEACH, LITTORAL, SHORE, OR STRAND. See BEACH PLANTS.

PLANTS, FOSSIL. See PALEOBOTANY.

PLANTS, MOVING. See MOVING PLANT.

PLANTS, POISONOUS. See POISONOUS PLANTS.

PLANT SOCIETY, or ASSOCIATION, or COMMUNITY. An assemblage of plants growing in a common habitat under similar life conditions. See DISTRIBUTION OF PLANTS; ECOLOGY.

PLANT SOCIOLOGY. The study of plant associations, or vegetation. Hitherto it has not been clearly separated from plant ecology, but ecology is primarily the study of the influence of environment on plants (or animals) and their organs, while associations can be studied and classified without reference to environment. One of the most interesting phenomena of plant sociology is succession, which is the gradual replacement of one type of vegetation by another, without any concurrent fundamental change in environment. Consult Brockmann-Jerosch and Rübel, *Die Einteilung der Pflanzengesellschaften nach ökologisch-physiognomischen Gesichtspunkten* (Leipzig, 1912). See DISTRIBUTION OF PLANTS; ECOLOGY, and bibliographies there given.

PLAQUEMINE, plāk'mēn'. A town and the parish seat of Iberville Parish, La., 85 miles west-northwest of New Orleans, on the Mississippi River and on the Texas and Pacific Railroad (Map: Louisiana, G 6). A government lock connects the Mississippi with the Bayou Plaquemine. The town has trade in cotton, rice, sugar, lumber, and fish, and manufactures lumber products. It contains St. Basil's Academy, St. John's School, a fine public school, a courthouse, and a city hall. The water works are owned by the municipality. Pop., 1900, 3590; 1910, 4955.

PLASENCIA, plā-sēn'thē-ā. An ancient but much decayed town of west Spain, in the Province of Cáceres (Map: Spain, C 2). Picturesquely situated on a rocky promontory on the bank of the Jerte, it is surrounded by the remains of a double line of walls with 68 towers. An aqueduct of 53 arches leads into the town, where there is an ornate Gothic cathedral. Plasencia was once a flourishing city. Pop., 1900, 7965; 1910, 9459.

PLASMA, plāz'mā (Lat., from Gk. πλάσμα, formation, molded figure, from πλάσσειν, *plassein*, to form). The fluid portion of the blood, rich in proteids. After the removal of the blood from the arteries and veins a part of these proteids separate by coagulation and form the blood clot, which is composed of fibrin, leaving a fluid poor in proteids and called the blood serum.

The term is also given by Haeckel to the protoplasm of cells surrounding the nucleus; or in the case of the monera, which are supposed to have no nucleus, to the unorganized protoplasm constituting such organisms. Cells are defined by Haeckel as bits of plasma containing a nucleus. See BLOOD.

PLASMA. A cryptocrystalline variety of quartz that is of a bright green to dark green color. Plasma is somewhat rare, and the best specimens come from India and China. Among the ancient Romans it was highly prized and was carved by them into ornaments of various kinds, and finely engraved specimens have been found among the ruins of ancient Rome. The variety used by the ancients is believed to have come from Mount Olympus in Asia Minor. See CHALCEDONY; GEMS.

PLASMODIUM (Neo-Lat., from Gk. πλάσμα, *plasma*, formation, molded figure + εἶδος, *eidos*, form). The vegetative body of a slime mold, consisting of a mass of naked protoplasm sometimes covering several square inches and crawling about like a gigantic amoeba. The significant feature of a plasmodium is its method of formation. When the spores of the plant germinate, they usually produce naked ciliated cells, which swim about freely, but finally coalesce in variable numbers to form a general body, the plasmodium, which is therefore a cell complex of naked cells. The plasmodium is one of the most favorable subjects for studying the behavior of protoplasm. See MYXOMYCETES.

PLASMOLYSIS (Neo-Lat., from Gk. πλάσμα, *plasma*, formation, molded figure + λύσις, *lysis*, resolution, from λύειν, *lyein*, to loose). The shrinkage of the protoplasm, due to the extraction of water from the cell sap by a solution of higher osmotic pressure in contact with the cell. The mature plant cell consists of a mass of protoplasm, inclosing one or more droplets of cell sap (vacuoles) and surrounded by a membrane called the cell wall. Under certain conditions, which are also those of activity, the layer of protoplasm is held so firmly against the cell wall by the osmotic pressure of the substances dissolved in the water occupying the vacuoles that it is usually stretched until its resilience equals the osmotic pressure within (Fig. 1). If such a cell be surrounded by a solution having an osmotic pressure greater than that of the cell sap, water will be withdrawn from the latter, the protoplasm will shrink, and the cell wall by its elasticity will follow the shrinking protoplasm until it has reached its unstretched dimensions. If the withdrawal of water still continues, the protoplasm will continue to shrink,

but the cell wall may be strong enough to maintain its form. Thus the protoplasm will be withdrawn from contact with the wall, a condition ordinarily taken to indicate the beginning of plasmolysis, but in reality a later stage (Fig. 2). If the cell wall be very thin, it may collapse upon

PLASMOLYSIS.

A cell from a filament of alga (*Cladophora*) before (1) and after (2) plasmolysis with sugar solution.

the shrinking protoplasm, folding and wrinkling irregularly. Should withdrawal of water continue, the protoplasm may shrink up into a small mass, the vacuole disappearing completely. When the amount of protoplasm in the plasmolyzed cell is relatively small, the protoplasm may happen to divide into two or more parts, a possibility which is taken advantage of for experimentation upon the functions of the nucleus. Only hypertonic solutions produce true plasmolysis of plant cells. It has been found, however, that distilled water produces what appears to be plasmolysis in some sea plants, and that hypertonic solutions of sodium chloride and other salts act similarly upon certain fresh-water forms. This has been termed false plasmolysis. It is probably due to the toxicity of these reagents in the pure form, rendering the protoplasm absolutely permeable to solutes within the protoplasm and vacuole. See OSMOSIS; Turgor.

PLASSEY, pläs'sé, or **PLASSI**. A small town of British India, on the Bhagirathi River, 75 miles north of Calcutta (Map: India, F 4). It is celebrated for the great victory gained by Clive (q.v.) over the numerically superior forces of Siraj-ud-Daula, Nawab of Bengal, June 23, 1757, a victory which laid the foundation of British supremacy in India. The actual site of the battle has been washed away by the river.

PLASTER (AS. *plaster*, OHG. *pflastar*, Ger. *Pflaster*, from OF. *plastre*, *plaietre*, *em-plastre*, Fr. *plâtre*, *emplâtre*, from Lat. *emplastrum*, from Gk. *ἐμπλάστρον*, *emplastron*, *ἐμπλάστον*, *emplaston*, plaster, from *ἐμπλάσσειν*, *emplassein*, to plaster, from *ἐν*, *en*, in + *πλάσσειν*, *plassein*, to form). A tenacious preparation for external application, solid at ordinary temperatures, but pliable and adhesive at the temperature of the body. Most plasters have as their base a compound of olive oil and litharge, constituting the lead plaster of the *Pharmacopœia*; others owe their consistence and adhesiveness to resinous substances or to a mixture of these with

wax and fats. These substances, alone or impregnated with medicinally active materials, are spread in a thin layer upon linen, muslin, paper, or leather. Formerly this spreading was done by hand, but of late years the work is accomplished entirely by machinery, which distributes the plaster mass with great evenness and perforates or makes porous the finished product. Since the introduction of machinery India rubber has been largely employed in the adhesive composition. There are seven plasters recognized by the *United States Pharmacopœia*, lead, mercury, opium, soap, resin (adhesive), capsicum, belladonna; the new *Formulary* includes three more, viz., aromatic or spice, camphor, and pitch; and there are many unofficial varieties. Besides their generally protective properties plasters have special therapeutic actions dependent on the active ingredient. Opium plaster, e.g., is anodyne, as is also belladonna; lead and arnica are soothing and astringent; mercury, alterative; capsicum is used as a counterirritant, and cantharides as a blistering agent. *Court plaster* consists of a solution of isinglass thinly spread upon silk, previously coated with tincture of benzoin. It is employed as a dressing to protect slight cuts or abrasions and must be moistened before application. Goldbeaters' skin is similarly used. In surgery, adhesive plaster is used extensively for its mechanical effect to reinforce weak muscles, to keep dressings in place, to cover ulcers, to limit effusions, etc.

PLASTER, LATHING AND PLASTERING. In architecture and building, plaster is a composition having lime for its basis, which is spread while wet and plastic upon a wall or ceiling, either directly or by means of laths (q.v.), brought to a true and smooth surface, and allowed to set or harden to form the final finished surface. The composition of plaster varies somewhat with the particular use. It is commonly applied in two or three coats. The first, or scratch, coat is a coarse mortar of lime and sand with hair or other fibre in abundance. If applied directly to brickwork or masonry, the joints must be raked out to provide a key for the secure adhesion of the plaster; if to laths or metal lathing, it must be forced by the trowel through the open spaces of the lathing. Its surface is then deeply scratched with the trowel to provide a key for the next coat, which in three-coat work is called the brown coat or floated coat of lime and sand without hair. This coat should not be applied until the scratch coat has set and dried; its surface is brought to a true plane (or other desired form) even with the grounds, which are strips of wood of the requisite thickness nailed to the lathing at intervals to serve as guides and to provide edges against which the plaster is to stop. At salient corners the plaster is finished against corner beads or rules of wood or metal. The third coat may be of lime with fine sand (sand finish) or of lime, very fine sand, and plaster of Paris (q.v.), called hard finish; or of any special composition, of which many kinds are patented, some of which are waterproof, others of differing degrees of elasticity to allow for racking and settling. The finish coat may be left bare or be kalsomined, papered, painted, or otherwise decorated.

This is a mere outline of the processes employed; the details vary greatly in different countries and for different kinds of work. The lime must in all cases be thoroughly slaked before mixing. In Europe it is prepared weeks or

months in advance of building, stored in pits covered with straw or earth, and allowed to ripen; in the United States a week or even less time is allowed for this purpose. The proportion

FIG. 1. EXPANDED METAL LATHING.

of sand mixed with it varies, but in general it is about double the volume of lime, the ingredients are mixed with sufficient water to produce the desired consistency. The laths, if of wood, are nailed about $\frac{1}{4}$ of an inch apart. Metal lathing may be of wire mesh, expanded metal (Fig. 1), or perforated metal (Fig 2). Being fireproof and capable of being bent to fit curved surfaces, it is displacing wood laths for all high-

FIG. 2. PERFORATED METAL LATHING.

class work. In ancient work the laths were of thin boards split into strips when nailed, or even, in England, of wattle (wattle and dab work). Decorative details, such as moldings, cornices, rosettes, and other ornaments, may either be run or molded in the wet plaster, or separately cast in plaster of Paris and nailed or cemented in place. Stucco (q.v.) is a special plaster having an admixture of cement, often with powdered marble in place of sand.

Plaster and stucco were known to the Assyrians, the Romans employed them lavishly for interior decoration, molding delicate patterns in relief in the wet plaster or painting them with pictures and ornaments in fresco, tempera, or encaustic pigments. The Renaissance revived the use of plaster and greatly extended its decorative applications, both by fresco (q.v.) painting and by relief ornaments and sculpture, which became at last media for the most extravagant abuse. In the seventeenth century the English began to use plaster extensively, too often as a substitute for solid masonry construction, leading to much trivial and sham architecture; and this practice became universal in the United States with the general adoption of wood as a building material. But much delicate and beautiful decorative work was done both in America and in Europe during the eighteenth and the early nineteenth century, especially in ceiling decoration. Consult: E. C. Eckel, *Cements, Limes, and Plasters* (New York, 1905), H. G. Richey, *Building Mechanics' Ready Reference Cement Workers' and Plasterers' Edition* (ib., 1908), F. T. Hodgson (comp.), *Mortars, Plasters, Stuccos, Artifi-*

cial Marbles, Concretes, Portland Cements, and Compositions (Chicago, 1914). See BUILDING; GYPSUM; LATHS AND LATHWOOD

PLASTER OF PARIS. A cement obtained by pulverization and partial calcination or dehydration of gypsum. It is chemically a hydrated sulphate of lime ($\text{CaSO}_4 + 2\text{H}_2\text{O}$), containing 46.6 per cent of sulphuric acid, 32.5 per cent of lime, and 20.9 per cent of water. Heated to a temperature between 250° and 400° F., gypsum loses three-fourths of its water and, in powdered form, is then known as plaster of Paris. Keene's cement is similar to plaster of Paris, the chief difference being that it is calcined at a much higher temperature (about 500° F.), all of its water is expelled, and it is an anhydrous sulphate. Both plaster of Paris and Keene's cement harden or set when water is added, and to this property they owe their value in commerce and the arts. Setting is caused by the plaster and water uniting to form gypsum again, which assumes a crystalline condition. It takes from 6 to 10 minutes for plaster of Paris to set, while Keene's cement, being wholly anhydrous, is of slower action and requires from 2 to 6 hours. To delay the set of plaster of Paris, glue, soda, sorghum, or some similarly acting substance is added as a retarder, and the mixture, taking several hours to set, is known as cement wall plaster, and is used, either by itself or in combination with lime paste, for the white or skim coat of walls and ceilings. Setting is attended by expansion of mass, and to this fact is due the sharpness of casts.

In commerce, besides being used for hard-finish plaster for walls and ceilings, plaster of Paris enters into the manufacture of staff, employed in the construction of temporary buildings; the construction of slabs, for permanent interior partitions, and the making of floor fillings. In surgery plaster of Paris is invaluable for making casts to inclose fractures; in dentistry it is employed for impressions from which plates are made and teeth set.

In the arts plaster of Paris is used for making casts of sculpture in the round, of high and low reliefs; of architectural details and replicas of archaeological objects, also for taking life and death masks of the human face. In pre-Renaissance interior sculpture a thin coat of plaster of Paris was often spread over wood or stone and impressed before setting with a fine diaper pattern as a foundation for paint and gilt embellishment. Plaster of Paris figured in the composition of the stucco or stucco duro of the Renaissance that was used for the molded enrichment of walls and ceilings and was introduced into England by Italian artisans during the reign of Henry VIII, but it did not enter into the composition of the parge, in which much of the best seventeenth-century English plasterwork was wrought. Since the beginning of the eighteenth century plaster of Paris has been extensively used, either by itself or as stucco in combination with lime paste, for cornices and ceiling enrichments. Consult William Millar, *Plastering, Plain and Decorative* (London, 1905), and G. P. Bankart, *The Art of the Plasterer* (New York, 1909). See GYPSUM; MORTAR.

PLAS'TIDS (from Gk. πλαστός, *plastós*, molded, from πλασσειν, *plassein*, to form), or CHROMATOPHORES. Living organs of the cell, usually embedded in the cytoplasm, of various form, having functions differing according to their ultimate mode of development. They differ from the nucleus in form and composition and

in multiplying by direct division. They are of three kinds—chloroplasts, chromoplasts, and leucoplasts. Chloroplasts (q.v.) contain chlorophyll and carotin, with often other subordinate pigments which add their special tint to the general yellow green of the ordinary chloroplast; chromoplasts (q.v.) have usually a red or yellow color, due to a predominance of carotin; leucoplasts (q.v.) are colorless and have as their special functions the formation of starch grains, proteid granules, or oil drops, out of material absorbed from the adjacent protoplasm. The oil formers have been distinguished as elaioplasts. Multiplication of plastids by direct division consists in the severance of the protoplasmic matrix into two parts by its contraction, which continues near the middle until the two portions are completely disjoined. Plastids are minute and undifferentiated in embryos and take on special form and character under the influence of the external conditions. Thus, plastids which develop near the surface of the plant are likely to form chlorophyll and become chloroplasts; those which develop in subterranean organs or thick aerial parts are likely to become leucoplasts and act as starch or proteid formers; while the plastids in flower leaves, the fruit, or even those in the root (e.g., the carrot) may develop as chromoplasts. See CELL; MITOSIS.

PLATA, pla'ta, Río DE LA. The estuary of the combined Paraná and Uruguay rivers (qq v.) in South America. It forms a large marine inlet between the republics of Uruguay and Argentina (Map: Argentina, H 4). It is 143 miles wide at its mouth and tapers gradually inland for a distance of 200 miles to the delta of the Paraná. The Plata is the outlet for an enormous volume of water, amounting during floods to over 2,000,000 cubic feet per second. Vast quantities of sediment are also brought down by the two rivers and are gradually filling up the estuary, which formerly extended more than 100 miles farther inland. Shoals are everywhere forming rapidly and, together with the strong currents and violent storms, make navigation dangerous. The best natural harbor on the estuary is Montevideo; artificial harbors have been constructed at La Plata and Buenos Aires by means of jetties projecting beyond the shallows which line the Argentine shore. The Plata estuary was discovered in 1509 by Díaz de Solís and received its present name (silver river) from Sebastian Cabot.

PLATEA, or **PLATEÆ** (Lat. from Gk. Πλάταια, *Plataia*, Πλαταιά, *Plataiai*). An ancient city in the extreme southeastern part of Bœotia, on the borders of Attica, at the foot of Mount Cithæron (Map: Greece, Ancient, C 2). Involved in war with Thebes, it sought help of the Spartans and was referred to Athens, as a nearer ally, apparently about 500 B.C. Received and defended by the Athenians, the Plateans showed their gratitude by coming with their whole force to the help of the Athenians at Marathon (q.v.). For this they suffered severely in 480 B.C., when Xerxes destroyed the town. The great victory of the Greeks under Pausanias over the Persians under Mardonius, gained near the town in the following year, restored them under a national agreement that guaranteed their independence. Their devotion to Athens brought on them the hatred of the Thebans, who made an unsuccessful attempt to take the town by surprise in 431, at the opening of the Peloponnesian War, and, when Platea was finally forced to surrender to

the Spartans (427 B.C.) after two years' siege, secured the death of the defenders. Restored after the Peace of Antalcidas (q.v., 387 B.C.), it was once more destroyed by the Thebans in 373. Finally, under Alexander the Great it was again rebuilt, but sank into insignificance, though it was still of some importance in the time of Justinian, who rebuilt its walls. The present walls seem to belong to the later city and inclose a much greater circuit than can have belonged to the town of the fifth century B.C.

Bibliography. G. B. Grundy, *The Battle of Plataea* (London, 1894); id., *The Great Persian War* (ib., 1901); H. B. Wright, *The Campaign of Plataea* (New Haven, 1904); W. Woodhouse, in *Journal of Hellenic Studies* (London, 1908); R. W. Macan, appendix to edition of *Herodotus*, vii-ix (ib., 1908); Winter, *Die Schlacht bei Plataeae* (Berlin, 1909).

PLATE. The word "plate" is properly used to designate ecclesiastical vessels, tableware, and sundry other objects made of gold or silver, with the exception of coins, jewelry, and articles intended to be worn upon the person. By an extension of the term's application pewter also is sometimes included under the head of plate. Articles of gold or silver coated upon a baser metal are known as plated ware, not plate, the latter term being reserved to indicate the use of the solid metal without a structural foundation of cheaper metal.

Gold in its chemically pure state is too soft to withstand the stress of usage and must be hardened with an alloy. For this purpose either silver or copper is used. The former imparts a pale or greenish tinge, the latter a reddish hue. The goldsmith may make his alloy and control his color to suit his purpose, but it is generally considered that the most satisfactory mixture for ordinary uses is composed of 6 parts of alloy to 18 parts of fine gold. For a piece not subjected to constant wear a mixture of 2 parts of alloy to 22 parts of fine gold is considered more satisfactory. See CARAT.

Gold may be cast, stamped with a die, beaten or hammered, chased or engraved, saw-pierced, and spun. Goldsmith's work also includes repoussé work, soldering of part to part and the attaching of small balls or grains of gold to their groundwork, a practice common in antiquity. (See JEWELRY) The goldsmith must also be expert in the setting of jewels, as, quite apart from the making of jewelry, precious stones are often used to embellish fine pieces of gold plate, especially plate for ecclesiastical use. Gold was one of the first metals used by man and has always occupied a conspicuous place in the arts. From remote antiquity to our own day every age has supplied notably fine examples of gold plate. The gold work of the Byzantine smiths was justly famed and supplied some of the inspiration that was later elaborated in the Gothic work of the mediæval goldsmiths. During the Roman period gold plate was chiefly for table use; during the Middle Ages and later it was confined chiefly to ecclesiastical purposes and the finest pieces are to be found among the chalices, pyxes, patens, monstrances, ciboria, censers, and reliquaries, sometimes set with gems, sometimes without other enrichment than the cunning craftsmanship of the smith. The use of gold plate for table service is a modern return to ancient luxurious precedent. Of mediæval specimens of goldsmith's art the *pala d'oro* or golden screen

in St. Mark's, Venice (ninth to eleventh century), and the golden altar of Sant' Ambrogio, Milan (ninth century), are perhaps the most deservedly famous.

In contour and type of decorative design gold plate accords with the age of its production. The most grace of shape is found in the early Greek, the Etruscan, and some of the Roman work; the most intricacy of decorative design and the most ingenious deftness of the craftsman in the mediæval work to be found from Constantinople to Ireland. In contour and decorative design modern gold plate rarely equals the old, as glitter and ostentation are too often set above the true worth of the goldsmith's skill.

Silver has for so many years been used for table service that "plate" and "tableware" are virtually synonymous. Like gold, silver in its fine or pure state is too soft for ordinary wear and must be alloyed to make it sufficiently hard. Copper is generally used for this purpose. Standard or sterling silver in England (also the generally accepted standard for America) is silver with the percentage of alloy so restricted that the metal shall be of the quality required by law for receiving the hall-mark. Eleven ounces, two pennyweights of fine or pure silver to the pound Troy was the old requirement for sterling silver, while the usual modern standard is an ounce of 18 pennyweights of fine silver and 2 pennyweights of copper. Silver plate is now usually spun or stamped and soldered and is rarely fashioned by the old process of raising or beating up a cup shape out of flat metal. Repoussé work, engraving, and chasing are the usual decorative processes employed.

Specimens of silver plate admirable in contour and decoration testify to the skill and taste of ancient silversmiths, as do the early pieces of gold plate. During the Middle Ages silver plate served the same liturgical uses as gold and was fashioned in the same manner, but, in addition, played a part in the domestic equipment of the houses of the wealthy in the form of platters, tankards, and covered cups. From the fifteenth century onward family silver in England and on the Continent became comparatively plentiful and was marked with the arms of the owners and enriched with divers decorative devices as well. So late as the eighteenth century it was a common thing, especially in America, to have surplus funds converted into table silver, which, in time of need, could be readily turned back into coin.

Silver forks and silver-handled knives were not in general use until much later than other articles of tableware. The earlier pieces of table service consisted chiefly of salts, porringers, spoons, platters, mugs, cans, tankards, teapots, sugar bowls, and creamers. All of these were made in great numbers by continental, English, and American silversmiths. The design of English table silver was closely followed by American makers in the Colonies, and the handiwork of the smiths from New England to the South was in no way inferior to that of their English contemporaries. Dummer, Hull, Revere, and many others will always be remembered as masters in their craft. A peculiarity of American silver is that much of it is unmarked by the maker. Then, again, in many cases the makers changed their mark from time to time and the date letter, found in

English silver, is lacking. This was doubtless because there was no central organization, as in England, which controlled the silversmiths and regulated their actions. From the middle of the seventeenth century onward the American silversmiths displayed great ability in their craft. The best American silver was made in Boston, Newburyport, New York, Albany, Philadelphia, Baltimore, and Richmond.

Sheffield plating consisted in soldering on to one or both sides of an ingot of the baser metal, usually copper, a thin plate of silver. After cooling from the soldering process the metal is rolled into sheets of the required thickness and then worked into the desired shapes. This difficult and nice process was supplanted in ordinary commercial usage by the introduction of electroplating. Since the middle of the nineteenth century electroplated table silver has been extensively manufactured in the United States. The body material upon which the silver is plated is frequently a composite metal known as German silver, consisting of 53 per copper, 31¼ per cent zinc, and 15¼ per cent nickel. Articles are finished in their required shapes before the electric bath is applied. The terms "single," "triple," and "quadruple" plate have reference to the amount of time the object is exposed to the electric bath and the consequent thickness of the silver deposit. In applying the electroplating process the objects to be coated are first cleansed in caustic soda and then in a strong solution of acids. See ELECTROPLATING. Consult: J. H. Buck, *Old Plate* (New York, 1888); Nelson Dawson, *Goldsmiths' and Silversmiths' Work* (New York, 1907); W. J. Cripps, *Old English Plate* (London, 1914).

PLATE, plâ'te, LUDWIG (1862-). A German zoölogist, born in Bremen. He studied at the universities of Jena, Bonn, and Munich. Zoölogical expeditions were made by him to the west coast of South America (1893-95), to Greece and the Red Sea (1901-02), and to the West Indies (1904-05). For a time curator in the Institut für Meereskunde at the University of Berlin, in 1909 he became professor of zoölogy at Jena. He published important research papers on Mollusca (*Chiton*) and a comprehensive summary and discussion of evolutionary problems in *Selectionsprincip und Problem der Artbildung* (4th ed., 1913).

PLATEAU, plâ-tô' (Fr., dim. of *plat*, plate). An elevated area of fairly level land with approximately horizontal strata. The chief difference between a plain and a plateau is that the plateau is higher; but this very difference in altitude gives the streams a chance to cut deeper valleys than in a plain. Plateaus are almost uniformly associated with mountains, being great blocks of strata uplifted during mountain folding with little disturbance of the layers. Thus, the uplift that formed the Western Cordilleras raised the plateau known as the Great Plains, which rises gently from the Mississippi to an elevation of 4000-6000 feet at the base of the Rockies; the Colorado plateau, between the Rockies and the Sierra Nevada, 6000-9000 feet high; and the Columbia plateau of Oregon and Washington. West of the Appalachians, and uplifted with them, is the Alleghany plateau, 2000 feet or more in height, which extends from eastern New York to Tennessee and includes hilly central New York, western Pennsylvania, West Virginia, eastern Kentucky, and Tennessee. The uplift of the Himalayas has formed the lofty plateau of

Central Asia, which rises from 10,000 to 13,000 feet. Plateaus are frequently so sculptured by denudation as to resemble mountains in form as well as in height, as in the case of the Catskills, a part of the Alleghany plateau. Their tops, however, form an even sky line, their strata are nearly horizontal, and it is only the excessive denudation, carving deep valleys, that has given them the mountainous appearance. For such dissected plateaus the name "pseudo-mountains" has been proposed. Where sculptured plateaus are adjacent to mountains it is often difficult to tell where the plateau leaves off and the true mountain begins.

Because of their elevation plateau streams have great cutting power and often form deep gorges and, in arid regions, cañons, of which the best example is the Grand Cañon of the Colorado. In arid regions the plateau topography is typically angular. The walls of the cañons consist of alternate precipices and talus slopes, as resistant and weak rock layers are encountered, and between the streams are flat-topped areas, capped by resistant strata, and known in western America as mesas if large and as table mountains or buttes if small. It is this flat-topped condition of the plateau, faced by steep slopes, that has given rise to the name "tableland" as a synonym for many plateaus in arid lands. Plateaus, in most climates, where the work of weathering and erosion is greater, are far less rugged and angular.

By reason of their height plateaus are generally cool, and, because of their association with mountains, they are often arid, having rain-bearing winds cut off by the higher land near by. Plateaus are not infrequently deserts, for other reasons. The high plateau region of Africa and Arabia, e.g., is traversed by the drying trade winds the year round and has little or no vegetation. Often the only parts of a desert plateau capable of supporting human life are the alluvial fans, on which streams flow from the adjacent mountains for a short distance before losing themselves in the sand. Portions of many plateaus, e.g., that of the Columbia, would be capable of cultivation if the water could be led out of the cañon valleys. In temperature there is often great range, from the warm base to the cool or cold top. This is well illustrated in the plateau of Mexico, which rises from a tropical climate to that of the cool temperate zone. Difference in temperature is accompanied by a decrease in evaporation and an increase in precipitation, so that the tops of high plateaus are often forest-covered, as in the case of the Colorado plateau, which rises from the desert region of western Arizona.

Agriculture is not usually highly developed on plateaus, partly because of the climate, partly because of the ruggedness. Grazing is the most widespread industry on arid plateaus, as in the western United States, where large areas are occupied only by scattered ranchmen. Consult W. M. Davis, *Physical Geography* (Boston, 1898), and R. D. Salisbury, *Physiography* (New York, 1909).

PLATEAU, JOSEPH ANTOINE FERDINAND (1801-83). A Belgian physicist, born in Brussels and educated at Liège. From the foundation of the University of Ghent in 1835 to 1871 he was there professor of experimental physics and astronomy. His researches were largely in optics, he devised the anorthoscope and was partly responsible for the stroboscope (q v).

Much of his work was done after he had become totally blind (about 1840), the eventual result of his having once gazed at the midday sun for 20 seconds to note the effects. His experiments are described in *Statique des liquides soumis aux forces moléculaires* (1873). Plateau also prepared a bibliography of the subjective phenomena of vision to the end of the eighteenth century.

PLATEAUX DES CAUSSES. See CAUSSES PLATEAUX DES.

PLATED WARE. See TABLEWARE.

PLATE MARKS, or HALL MARKS. The legal impressions made in Great Britain on watchcases, jewelry, and gold and silver plate, after the material has been assayed at the various government assay offices. In the case of jewelry the marks are, with a few exceptions optional. There are four distinct kinds of plate marks: (1) the standard or quality mark, (2) the mark of a particular office at which the article was assayed, (3) the mark by which the date of marking may be ascertained, and (4) the maker's private mark. Formerly if the article was dutiable the head of the reigning sovereign was also added, but in 1798 watchcases were exempted from this rule and in 1890 the practice was entirely abandoned. The standard

mark of the London office is a lion passant  for sterling silver, a crown with the figures 22

 for 22-carat gold, and the crown with the figures 18 for 18-carat gold. Up to 1845 a lion passant was likewise the standard mark of 22-carat gold, and from 1697 to 1723, during which time the quality of standard silver was raised from 0.925 to 0.959, the standard mark was a lion's head and the hall mark a figure of Britannia. The standard mark at Edinburgh is a

thistle ; at Glasgow, a lion rampant , at Dublin, a harp crowned , with the figure 22 added in the case of 22-carat gold.

The hall marks of some of the particular assay offices are: London, a leopard's head, crowned up to 1823 , Edinburgh, a castle , Glasgow, a tree, a fish, and a bell , Dublin, a figure of Hibernia ; Chester, a sword between three wheat sheaves ; Birmingham, an anchor  . In addition, the Sheffield

office is designated by a crown; Exeter, by a castle with three towers; York, by five lions on a cross; and Newcastle, by three castles.

The date marks of the Goldsmiths' Hall, London, which are changed annually on May 30, are the first 20 letters of the alphabet, each series differing in some slight detail (either in the style of the letter or in the shape of the shield on which they are placed) from a former series. The date marks of Birmingham, which are changed annually in July, are also letters of the alphabet.

The character of the maker's mark was optional up to 1697, when it was fixed as the first three letters of his surname. Since 1739 the mark has been the initials of the maker's Christian name and surname. Watchcases of foreign make when marked in Great Britain bear special stamps. In Switzerland there are various plate

marks, but the regulations concerning them are not comprehensive, and English marks are accepted in place of the Swiss. In the United States various arbitrary trade-marks are adopted by the leading manufacturers, but they have no official significance, although in certain States marking articles of gold and silver falsely as to their proportion of fine gold or silver is a legal offense. For gold and silver assayed in a United States assay office a certificate will be supplied.

PLATEN-HALLERMUND, plät'en häll'ēr-munt, AUGUST, COUNT VON (1796-1835). A German poet, born at Ansbach. Educated in the Corps of Cadets and the Pages' Institute at Munich, he entered the Bavarian army in 1814 and took part in the campaign of 1815, seeing, however, no action. Wearing afterward by the monotony of garrison duty, he obtained a furlough and, provided with a stipend, devoted himself to philological and philosophical studies, first at Würzburg (1818-19), then until 1825 at Erlangen, where Schelling exercised a lasting influence upon him. He had early turned to Oriental studies and as a fruit thereof published in 1821 *Ghaselen*, a collection of poems in Oriental forms, followed in 1824 by *Neue Ghaselen*, both series winning favorable comment from Goethe. A visit to Italy in 1824 inspired *Sonette aus Venedig* (1825), the finest collection of sonnets in the German tongue, remarkable for classic beauty of form. Bitterly opposed to romanticism as he found it, he appears nevertheless under romantic influence (especially in choice of subject) in his dramatic poem *Der gläserne Pantoffel* (1824), welded out of the fairy tales of Cinderella and Snowdrop, in the comedy *Der Schatz des Rhampsinis* (1824), and in his later epic *Die Abbassiden* (1834), based on stories from the *Arabian Nights*. The extravagances of German romanticism, however, kindled his wrath, and he satirized the fate tragedy effectually in *Die verhängnisvolle Gabel* (1826), a fork here taking the place of the dagger by which, in the typical fate tragedy, the family ancestress comes to grief, and a dozen descendants being stabbed by the fatal fork before the close of the drama. The command of language and mastery of versification distinguishing this literary comedy are even excelled in *Der romantische Oedipus* (1829), directed more especially against the lack of form in romanticism and its tendency to experiment with new and unwieldy metres, the

chief targets of Platen's satire here being Immermann (q.v.), who had ridiculed his *Ghaselen*, parodied as "Nimmermann," and Heine. In 1826 Platen had made Italy his permanent home and thence only twice visited his native land. During his last sojourn in Germany in 1833 he published the historical drama *Die Liga von Cambrai* and *Geschichten des Königreichs Neapel von 1414 bis 1443*. He died at Syracuse, Sicily. Platen was a poet of exquisite taste, whose later verses are models of formal virtuosity in their complex rhythms and technical polish of rhyme.

Bibliography. His complete works were published in one volume (Stuttgart, 1839), in five volumes (ib., 1847), and often since. The best edition is that by Koch and Petzet (12 vols., Leipzig, 1910). His best biography is to be found in his *Tagebücher*, edited by Laubmann and Scheffler (Stuttgart, 1896-1900). Consult also: Minckwitz, *Graf Platen als Mensch und Dichter* (Leipzig, 1838); Gildersleeve, *Essays and Studies* (New York, 1890); Besson, *Platen: Etude biographique et littéraire* (Paris, 1894); Stockhausen, *Studien zu Platens Baleaden* (Berlin, 1899); Greulich, *Platens Litteraturkomödien* (Bern, 1901); Heinze, *Platens romantische Komödien* (Marburg, 1907); Schlösser, *A Graf von Platen* (Munich, 1910); Erich Petzet, *Platens Verhältnis zur Romantik* (Berlin, 1911).

PLATERESQUE, plät'er-ēsk' (Sp. *Plateresco*, from *platero*, silversmith, from *plata*, silver). A name given to that phase of Renaissance architecture and decoration which prevailed in Spain during the first half of the sixteenth century, passing gradually into the more dry and more formally classic development called the Griego-Romano. Its inspiration was Italian, in detail, especially after the battle of Pavia (1525); but the decorative spirit, the mixing of late Gothic details with those of the Renaissance, the contrasting of broad plain wall surfaces with crowded openings above and with rich concentrated decoration, and the exuberance of ornament, are distinctly Spanish. The doorways were treated with especial richness and were framed sometimes in a decorative composition reaching to the top of the building, as at Salamanca University; and the candelabrum shaft, derived from examples at Milan and Pavia, became a favorite ornament and even a substitute for columns, as in the court or patio of the Irish College in the same city. Escutcheons and armorial bearings were prominent in the decorative scheme. The carving was often exquisite in execution, recalling silversmiths' work by its richness and delicacy, whence the name of the style; but it was often overwrought, as in the Ayuntamiento at Seville. The predellas (q.v.), altarpieces, tombs, and ironwork (grilles and screens) are often marvels of decorative beauty of design and execution. Gil de Hontañon, Diego de Siloé, Egaz and Pedro Gumiel are among the prominent architects of this period. Consult A. N. Prentice, *Spanish Renaissance Architecture and Ornament* (Boston, 1908), and Byne and Stapley, *Rijeria of the Spanish Renaissance: A Collection of Photographs and Measured Drawings with Descriptive Text*, published by the Hispanic Society of America (New York, 1914).

PLATFORM SPRING, IN MOTOR VEHICLE. See MOTOR VEHICLE.

PLATHANDLER, plät'händ-lēr. A Dutch name in South Africa for the curious clawed toad (*Xinopus calcaratus*), which is distin-

guished by having strong metatarsal claws and minute eyes. These small frogs, which are tongueless, are peculiarly aquatic, never leaving the water except when forced to change their locality on account of drought or scarcity of food. Specimens have been naturalized in England, where their habits and methods of breeding have been well studied. Consult Hans Gadow, "Amphibia and Reptiles," in *Cambridge Natural History*, vol. viii (London, 1901).

PLATIERE, JEAN MARIE and MARIE ROLAND DE LA. See ROLAND DE LA PLATIERE.

PLATING. See ELECTROCHEMISTRY, INDUSTRIAL: ELECTROPLATING.

PLATINIRIDIUM (Neo-Lat., from *platinum* + *iridium*). A native alloy of iridium with platinum and allied metals that crystallizes in the isometric system, has a metallic lustre, and is silver white in color. It is found chiefly with platinum ores in the Urals and in Brazil; also in the gold alluvial deposits of the Pacific coast.

PLATINOTYPE. See PHOTOGRAPHY.

PLATINUM (Neo-Lat., from *platina*, from Sp. *platina*, platinum, from *plata*, silver, plate, from *plato*, flat, from Gk. *πλᾶνς*, *platys*, flat, wide, broad; connected with Lith. *platus*, broad, Skt. *prthu*, wide, from *prath*, to spread out). A metallic element, the existence of which was first made known in Europe by Antonio de Ulloa in 1738. It was first described by Watson in the *Philosophical Transactions* of 1750. It is found native, usually alloyed, however, with iron, palladium, rhodium, iridium, osmium, and other metals, generally in grains and scales in alluvial deposits in South America, the Urals, and, to a limited extent, in many other parts of the world; also in small quantities in the gold washings of the Pacific slope. A few irregular lumps or nuggets have been found, one of which, now in the Demidoff cabinet in St. Petersburg, weighs 7 837 kilograms. All of the early platinum came from South America and it was not until about 1825 that Russia began to figure as a producer. Some 90 per cent of the world's present annual supply comes from the Russian Urals. This has lately amounted to about 300,000 ounces per year. No other country produces more than 1000 ounces per year except the United States of Colombia, whose output fluctuates considerably, but may easily reach 12,000 ounces per year. For the preparation of pure platinum the commercial metal may be melted with six parts of pure lead and the finely divided alloy treated with dilute nitric acid. The residual black powder, containing lead, platinum, iridium and other platinum metals, may then be dissolved in dilute aqua regia, the lead, after evaporation of the solution to small bulk, precipitated with dilute sulphuric acid, and the filtrate further precipitated with an excess of ammonium chloride and some common salt. This precipitate of ammonium chloroplatinate with some rhodium is in turn heated with the acid sulphates of potassium and ammonium and, on cooling, the resulting mass is treated with hot water, which leaves nothing but pure platinum behind. The commercial metal is usually obtained by a somewhat complicated wet process, although it is possible to obtain it more or less pure by a dry process.

Platinum (symbol Pt; atomic weight, 195.2) is a grayish-white metal with a density in the cast form of 21.5 at 17.6° C. It fuses at about 1750° C. (3182° F.). It is very malleable and

ductile, becoming soft and workable at a temperature far below its melting point. It is somewhat harder than copper, and has a tenacity of 30,000 to 50,000 pounds per square inch. Wires have been drawn that are one twelve-hundredth of an inch in diameter. Small quantities of other associated metals commonly reduce its ductility. Molten platinum absorbs oxygen, which is violently evolved when the metal is rapidly cooled. Platinum foil may absorb from 80 to 200 times its own volume of hydrogen under different conditions. This and other gases are eliminated by heating the metal *in vacuo*. Spongy platinum is finely divided metallic platinum which possesses a very large surface compared with its mass and is able to absorb large quantities of oxygen. It is readily prepared by igniting ammonium chloroplatinate. It forms a porous mass which may be compacted and worked into metal of ordinary appearance and properties under the influence of pressure and heat. Of similar nature is platinum black, which is usually prepared by heating warm alkaline platinum solutions with some organic reducing agent. It absorbs more than 800 times its volume of oxygen, which acts as a vigorous oxidizer when in this condition, so that hydrogen or other inflammable gases may be spontaneously ignited under its influence. Platinum is permanent in the air under practically all conditions. It is not dissolved by any of the ordinary acids, but goes slowly into solution in aqua regia or other liquids which evolve chlorine. Platinum forms alloys with most of the metals, some of which, such as the alloy with 10 per cent iridium, have found use in the arts, especially for the purpose of making standard weights and measures. Metallic platinum is employed in making crucibles and similar utensils for laboratory use, and, as it is not attacked by acids, vessels composed of it have been used extensively in sulphuric-acid works. It also finds extensive application in the manufacture of incandescent electric lamps, as it is the only metal which possesses practically the same coefficient of expansion as glass and can be satisfactorily scaled into the glass at the base of the lamp. Probably one-half of the entire consumption is required in dentistry and in the manufacture of jewelry. Modern platinum settings for precious stones contain up to 25 per cent of iridium, which contributes strength and hardness, whereby very delicate but serviceable designs may be wrought.

Platinum forms a series of platinum compounds derived from the monoxide (PtO) and a series of platonic compounds derived from the hypothetical dioxide (PtO₂). The most important of the platinum salts is the platonic chloride or platinum tetrachloride, which is a brownish red deliquescent salt. This combines with metallic chlorides to form the well-known chloroplatinates of the type K₂PtCl₆. The common laboratory reagent obtained by dissolving platinum in aqua regia and evaporating with hydrochloric acid until the nitric acid is removed is a solution of chloroplatinic acid, from which the above-mentioned chloroplatinates are easily obtained by double decomposition. Of considerable interest to the chemist are also the so-called platinum bases, which are compounds of platinum salts with ammonia.

Metallurgy. All of the Russian platinum comes from placers and the greater part of it is obtained by dredging. The extraction of platinum from the ore consists first in concentrating

the ore by washing and removing the gold by amalgamation; the further treatment may be conducted either in the wet way or the dry way. The dry method does not yield pure platinum, but alloys of platinum with iridium and rhodium. The production of pure platinum requires the use of a wet method. Electrolysis is used to separate metallic platinum from its alloys with gold. Most of the platinum produced in the United States is separated in the refining of gold (electrolytic) at the mint or at private refineries. Two methods of dry extraction have been used. One consists in melting the ore in a vessel made of lime and remelting the button thus obtained; the second method is to melt the ore with galena and litharge in a reverberatory furnace and scorify the lead-platinum alloy obtained in order to remove the lead. Finally the platinum is fused into an ingot in the lime furnace. The wet method of extraction consists essentially in bringing platinum into solution with aqua regia, precipitating from this solution ammonium chloroplatinate by means of ammonium chloride and ammonia, and then decomposing the compound and volatilizing everything except the platinum at red heat. The wet method is the principal method of platinum refining now employed. Consult: J. L. Howe, *Bibliography of the Metals of the Platinum Group, 1748 to 1896* (Washington, 1897); Carl Schnabel, *Hand-Book of Metallurgy*, vol. 11 (New York, 1907); T. K. Rose, *The Precious Metals, Comprising Gold, Silver, and Platinum* (ib., 1909).

PLATNER, SAMUEL BALL (1863-). An American Latin scholar. He was born at Unionville, Conn., and graduated from Yale in 1883 (Ph.D., 1885). He taught at Western Reserve University after 1885, becoming professor of Latin in 1892. Platner served as secretary of the managing committee of the American School of Classical Studies in Rome (1897-1911), as professor in the school (1899-1900), and as president of the American Philological Association (1900-01). He edited *Selections from the Letters of the Younger Pliny* (1894) and published *The Topography and Monuments of Ancient Rome* (1903; 2d ed., 1911).

PLATO (Lat. from Gk. Πλάτων, *Platōn*) (c. 427-347 B.C.). A Greek philosopher, born on the island of Ægina, a dependency of Athens, where his father held an estate. His real name was Aristocles. His father claimed descent from Codrus (q.v.); his mother, Perictione, from Solon (q.v.). The known facts of his life are few. He received the education in music and gymnastics of a well-born Athenian youth, under the limitations imposed by the virtual state of siege created for Athens by the Peloponnesian War. His writings are sufficient evidence that he absorbed all the culture of his age—poetry, art, pre-Socratic philosophy, the Sophistic enlightenment (see SOPHISTS) in a synthesis, as Emerson says, "without parallel before or since." We may believe the tradition that he distinguished himself in gymnastics and wrote poetry. The poems he is said to have burned when, at the age of 20, he experienced the higher inspiration of the philosophic muse through his knowledge of Socrates.

For a youth of Plato's birth and endowments politics would have been the natural career. Two of his dialogues are named from his kinsmen Charmides and Critias, who were prominent in the oligarchy of the so-called Thirty

Tyrants which dominated Athens in the year 404-403. (See GREECE, *History*; TYRANT.) The experiences of that year disenchanted him forever with regard to the rule of the Fair and Good, as the Thirty called themselves. The judicial murder of Socrates (q.v.) by the restored democracy in the year 399 and the increasing license and weakness of popular rule through the fourth century further embittered his spirit and developed the conviction that all existing forms of government were mere partisan factions and that there was no hope of salvation for the cities of Greece until "either philosophers should become kings or kings philosophers." The philosopher whose lot was cast in fourth-century Athens could exercise active citizenship only in the city of the ideal, "of which a pattern is laid up in heaven"—the City of God of later Græco-Roman and early Christian idealism. The powers and social aspirations that might have made a great statesman and leader of men found expression in the *Republic* and the *Laws*, the masterpieces of Plato's maturity and old age. After the death of Socrates Plato is said to have left Athens and to have traveled extensively in Greece, southern Italy, Sicily, and even Egypt and northern Africa. About the year 388 he is said to have visited the court of Dionysius (q.v.) the Elder, tyrant of Syracuse, who, offended by his freedom of speech, contrived to have him sold into slavery at Ægina on his voyage home. The story adds that he was at once ransomed by friends. Modern conjectural scholarship tries to trace in Plato's writings the chronological succession of Megarian, Italo-Pythagorean, Egyptian, and Sicilian influences experienced in these voyages. But we really know nothing beyond the presumption that he was absent from Athens for a large part of the 10 years that followed Socrates' death. At the age of 40, about 387, he established the Academy (q.v.), which, with the rhetorical school of Isocrates (q.v.), made Athens in very deed the educator of Hellas, and was the beginning of that university life at Athens which continued for eight centuries. The name is derived from the hero Academus, adjoining whose shady precinct and gymnasium on the road to Eleusis, 1 mile from Athens, was the small estate which Plato dedicated to the uses of the school. By Plato's will the institution was probably perpetuated as a religious foundation sacred to the Muses, and this organization was imitated in the Lyceum of Aristotle, the garden of Epicurus, and the Museum of Alexandria. Here for 40 years Plato taught, debated high and subtle questions with his favorite pupils, and "curled and combed the styles of his dialogues" until his death in 347. Among his most famous pupils were Speusippus, his nephew, who succeeded him as scholar; Xenocrates, the successor of Speusippus; Aristotle (from the year 367), the orators Demosthenes, Hyperides, and Lycurgus, the astronomer Eudoxus of Cnidos, and many other eminent men from all parts of Greece. The inner life of the school we can only divine. From Plato's sneers at the Sophists, who took pay for spiritual gifts, we may infer that no tuition fees were exacted. We may conjecture that some of the most abstract and metaphysical dialogues, the *Parmenides*, the *Sophistes*, the *Politicus*, the *Philebus*, are idealizations of actual discussions in the school, as the *Charmides*, *Lysis*, *Protagoras*, and *Gorgias* are reflections of real conversa-

tions in the gymnasia and public resorts frequented by Socrates. A famous passage of the *Phaedrus* exalts the spoken above the lifeless written word; Plato, like those two other great artists in language, Renan and Ruskin, affected to hold mere literary virtuosity in light esteem. Contemporary writers of comedy represent the students of the Academy as dandified young coxcombs, and jest about the obscure idea of good, and the scientific definition of the cucumber by dichotomy. Plato was drawn into the turmoil of real life by his two visits to Syracuse in the years 367 and 366 and shortly after. The younger Dionysius (q.v.) had succeeded his father as tyrant of Syracuse, and Dion (q.v.), his kinsman by marriage, whose friendship Plato had won in his first visit, cherished the illusion that, under suitable guidance, the youthful ruler might develop into the philosopher king postulated in the *Republic*. The failure of the experiment, the banishment of Dion as its result, the expedition organized in the year 359 by Dion with the aid of pupils of the Academy against Dionysius, whom he drove into exile in turn, his assassination by his fellow pupil Callippus, and the anarchy into which Syracuse was plunged as a consequence, furnished abundant matter for those inclined to blaspheme philosophy and to scoff at the scholar in politics, and may plausibly be conjectured to have contributed to the mood of embitterment and disillusion that prevails in the great work of Plato's declining years, the *Laws*. The pathos of Plato's old age has been beautifully expressed by Wilamowitz (*Aristoteles und Athen*, vol. i, p. 330). But credible anecdotes illustrative of the esteem and love in which he was held by his fellow citizens and numerous pupils soften the picture. If some illusions were gone, the grasp of thought and the synoptic command of experience remained to the end. The *Laws* lacks the inimitable Attic grace of the *Symposium* and the *Phædo*, but the thoughtful reader finds compensation in the breadth of its survey of human life and Greek institutions, its intense moral and religious earnestness, the solemn detachment of its resigned and stately melancholy.

Plato's extant writings (including probably all he ever published) were arranged by the rhetor Thrasyllus (first century A.D.) in nine tetralogies, or groups of four. One member of the ninth group is constituted by the 13 letters which are almost certainly spurious, though some scholars now defend the genuineness of some of the letters, e.g., of the seventh epistle because of the interesting and plausible account which it gives of Plato's relations with the court of Syracuse. Of the 35 dialogues, the *Hyparchus*, on the love of gain; the *Erastæ* and the *Theages*, on philosophy; the *Minos*, on law; and the *Epinomis*, a sort of supplement to the *Laws*, are generally acknowledged to be spurious. Many reputable scholars still doubt the genuineness of the *Alcibiades I*, on the nature of man; the *Alcibiades II*, on prayer; the *Hippias I*, on the beautiful; the *Hippias II*, on falsehood; the *Ion*, on Homer and poetical inspiration; the *Menæxenus* or Funeral Oration; and the *Kleitophon*, a fragment. The acceptance or rejection of these seven minor works affects very slightly our total impression of Plato's thought and art.

The dialogues vary in length from the 22 pages of the *Crito* to the 418 pages of the *Laws*, and in manner from the lively dramatic repre-

sentation of a possible conversation in a Greek gymnasium (the *Lysis* on Friendship, the *Charmides* on Temperance) to the didactic exposition in perfunctory dramatic form of an obscure problem of logic or metaphysic (*Sophistes*, *Parmenides*), a theory of the universe (*Timæus*), or a project for the reformation of society, education, and law (*Republic*, *Laws*). The dialogue form arose naturally out of the Greek drama, the Athenian habit of discussion, and the use of the dialogue by Socrates. Its history has been written by Hirzel (*Der Dialog*, Leipzig, 1895). (See *DIALOGUE*.) It was employed by other disciples of Socrates as well as by Plato, and specimens of such dialogues are included in Xenophon's *Memorabilia* of Socrates. The form is sometimes purely dramatic, as in the *Euthyphro*, on holiness, or in the *Gorgias*, on rhetoric; sometimes, as in the *Republic*, it is that of a narrated dialogue, which permits description and comment, as in the modern novel. Socrates is the principal speaker in all except the *Sophistes*, *Politicus*, *Parmenides*, *Timæus*, *Critias*, and the *Laws* (in the *Laws* he does not appear at all).

One of the chief problems of recent Platonic scholarship is the determination of the dates of the dialogues through statistical study of the style (Lutoslawski, *Origin and Growth of Plato's Logic*), by tracing the development of Plato's thought, or by the aid of casual historical allusions. The results, though affirmed with confident dogmatism, cannot be verified. The *Laws* and the *Timæus* are known to be late. The *Republic* belongs to Plato's middle age. The minor dramatic dialogues are presumably as a whole early. The severely metaphysical *Sophistes*, *Politicus*, and *Philebus* probably follow the *Republic* rather than precede it, as older scholars believed. But the unity and consistency of Plato's thought as a whole, and the tradition that he revised and corrected his greater works to the end, lessen the significance of these researches.

The perennial charm of Plato resides precisely in the baffling combination which he presents of consummate artist and subtle metaphysician. We may say roughly that the dialogues have three chief aims: (1) the ideal portraiture of the master Socrates (see *SOCRATES*), (2) the dramatic portrayal of the practice of discussion, the game of question and answer, as it has been called, which played so large a part in Athenian life (see *DIALOGUE*; *DIALECTIC*); (3) the exposition of doctrine. Plato is the Shakespeare of ideas. All ideas are allowed to speak for themselves on his stage with something of the dramatic fairness that seems to justify every personage, from his own point of view, upon the stage of Shakespeare. And, though it is not so difficult to determine in this dramatic conflict of ideas the beliefs seriously defended by Plato as it is to observe the habitual preferences, that define Shakespeare's personality, it is still very difficult. The hasty reader will accept as Platonic definitions, distinctions, arguments, and fallacies that have a purely dramatic significance. He will interpret as marking stages in the development of Plato's own thought professions of ignorance or bewilderment which the Socratic irony employs merely to ensnare pretentious self-sufficiency, to stimulate youthful thought, or as a dramatic prelude to the favorite Socratic moral: "Let us re-examine the whole question together." He will take literally

Socrates' affectation of following whithersoever the wind of discussion may blow, and, dazzled by the kaleidoscopic shiftings of suggestion and interesting ideas, he will be skeptical of the existence of any underlying unity of thought and purpose.

Instead of falsifying Plato's teaching by forcing it into the framework of an artificial system, it is better simply to enumerate a few of the dominant conceptions and aims that preserve its unity and consistency amid all its apparent variations. There is first dialectic—the faith which he shared with Socrates in the value of rational discussion, if not as the organon of absolute truth, at least as the only protection against the errors and confusions of untested opinion. Both Plato and Socrates believe that, as John Stuart Mill phrases it, "there is no knowledge, and no assurance of right belief, but with him who can both confute the opposite opinion and successfully defend his own against confutation." Many of the most entertaining passages of the dialogues are mere dramatic illustrations of the inability not only of the average man but of the most brilliant sophists and rhetoricians of the day to do this (*Gorgias*, *Protagoras*). They could bandy abstractions implying praise or blame and discourse eloquently of virtue and the education that fitted men for life. But they could not define the terms they used or defend the coherency and consistency of their opinions against objectors. They were unable to make the preliminary distinctions and classifications requisite for the intelligent discussion of such questions as Can virtue be taught? (*Meno*) or Is pleasure or knowledge the good? (*Philebus*). They had opinions, but no knowledge. Dialectic was said to have been invented by Zeno, the author of the famous fallacies disproving motion; and the Athenians of the fifth century were subtle and skillful disputants. But the rules of the game (the principles of elementary logic) had never been formulated, and Socrates was the first to play it with system and conscious mastery. He demanded definitions of general terms and confirmed or refuted them by apt induction and generalization from simple pertinent instances. So great was his skill that, as Xenophon affirms and Plato illustrates, he could deal with an opponent as he pleased. None could escape the net-work of argument which he wove. Plato inherited from Socrates his intense conviction of the difference between untested opinion and reasoned knowledge, and, starting from the Socratic logic of the definition and simple induction, he worked out in concrete examples the details of the logic of consistency so that all that remained for Aristotle was to codify them and add the formulas of the syllogism. In the prosecution of this task Plato was confronted by certain quibbles about being and not being, the one and the many, the whole and the part, rest and motion, the reality or unreality of abstract ideas, which from one point of view are mere verbal fallacies, from another are problems of psychology and metaphysics. To interpret aright the more metaphysical and abstract dialogues, we must remember that, whether Plato succeeded or failed in solving metaphysical problems which are still debated, he never lost sight of his main object, the removal of the verbal fallacies from the pathway of practical logic. Familiarity with the Aristotelian logic makes this seem a trifle to us. But to ac-

complish it for the first time was one of the greatest achievements of human genius.

A second fundamental Platonic thought is the postulate that the art of conduct, of individual and social life, ought to be as truly scientific as are the various arts and sciences that deal with material things. To emphasize this thought, Plato makes use of the favorite Socratic comparison or confusion of the virtues and the arts. As there is an art of carpentry or shoemaking known only to him who has mastered it, so virtue, the art of happiness, of conduct, the political or royal art, must be conceived as a specific form of knowledge demanding a special training in its possessor. To the end or aim of the royal art all partial and particular ends would be subordinated—it would be an idea of good in which all particular goods, virtues, and utilities have their ground. Many of the minor dialogues illustrate the inability of the average disputant to apprehend any such larger end or to define particular virtues and ends in relation to it. Others refute the pretensions of the sophists, rhetoricians, and politicians who claim to teach or practice the art of life and government, but in fact teach only the opinions of the multitude—the humors of the many-headed beast, or the knack of persuasive speech, or the tricks by which the politician seizes the helm of the ship of state, though he has never learned to steer. Even the few virtuous and judicious statesmen of whom Athens boasts are guided, not by knowledge, but by right opinion or happy instinct, which, in the corruption of the existing social order and the absence of all systematic and effective teaching of virtue, must be said to come to them by grace divine (*Meno*).

The *Republic* contains the positive and constructive application of these ideas. There Plato expounds his ideal of a city in which the end of government is not the domination of a faction, nor the multiplication of wealth, nor doing as one likes, but the virtue and consequently the true happiness of the individual citizen and the order and harmony of the whole. The chief means to this end is justice—the division of labor generalized to mean the proper distribution of function among the three faculties of the soul, the appetites and desires, the emotions and passions, and the ruling reason, and answering to this the severe limitation to their proper work of the corresponding groups of the population—the industrial, the military, and the governing classes—determined by birth only in so far as birth is found to involve natural aptitude. The rulers, the embodied reason of the state, are selected by severe tests from the warriors. Absolute disinterestedness is secured by forbidding them to hold private property and by the paradoxical community of wives and offspring. In order to master the political art they must supplement the ordinary education in music and gymnastics by a prolonged discipline in mathematics, astronomy, and dialectic, which, as Plato expresses it in a poetical figure, the source of much later mysticism, will enable them to apprehend the idea of good, the cause of light and truth and being in the intelligible world, as the sun is in the world of matter. In the *Republic*, as everywhere, the logical skeleton of Plato's ethical and political theory is clothed with an eloquence nobly employed in the assertion of the ideal aims of life as against base, sensuous, and sordid views of happiness

and success. And many readers who care nothing for the abstract logic of Plato's ethical philosophy will be charmed or inspired by the preacher and prophet—his impassioned faith in the moral order of the world, his denunciation of materialistic, sensationist, and hedonistic philosophies, his affirmation in poetical myth and allegory of the hope of immortality and the inevitableness of the judgment of God.

A word must be said of the theory of ideas with which most expositors of Plato begin and which might be made the centre of the Platonic philosophy. Taken literally, it is the assertion of the astounding paradox that reality belongs not to the individual thing, this book, this tree, this man, but to the general idea of book, tree, or man. The individual things are but the fleeting, perishable copies of the form or idea, which abides in changeless unity forever and is the sole object of real knowledge. Primarily this is merely a paradoxical logic of general terms, which, employed with Plato's unflinching consistency, serves as well as the reverse mode of speech that alone seems reasonable to us. In the second place, it is a manifestation of the plasticity of the Greek imagination, which in Plato, as in the mythology and on the stage of Aristophanes, refuses to deal with ideas as algebraic counters, but, since they are real forces in thought, life, and speech, treats them as veritable things and persons. In the third place, it is a metaphysical doctrine with regard to the noumenon, or reality behind the veil of sense, which all philosophies that acknowledge an absolute, whether in being or cognition, are compelled to assume. Only those who are willing to affirm that sense is all can consistently condemn as absurd Plato's assertion that ultimate realities are more akin to our ideas than to our sensations and perceptions. Many passages show that Plato saw, as clearly as his modern critics see, the conflict of this doctrine with common sense. But metaphysics is not common sense. The ideas were the only alternative, he thought, to the philosophy of Heraclitus (q.v.), that all things are in perpetual flux, which Plato interpreted to mean, in modern phrase, that reality is merely "the permanent possibility of sensation." It is because he would not accept this doctrine that Plato clung to the ideas; not, as we are so often told, because in the infancy of human thought he did not understand the processes of generalization and abstraction.

Associated with the theory of ideas is the poetical doctrine of reminiscence or recollection. The soul has beheld the ideas in a previous stage of existence. "Our birth," as Wordsworth says, "is but a sleep and a forgetting." Learning, experience, is the re-collection of the ideas through the suggestions and association of their imperfect copies in this world. We have never seen two things absolutely equal, but we recollect the idea and ideal of pure equality from the proximate equals of experience. Mathematical truths can be elicited from an uneducated man by skillful questioning (*Meno*). The idea of beauty alone has a not wholly inadequate embodiment on earth. Hence the peculiar ecstasy of the thrill which the aspect of beauty stirs in the lover. It awakens immortal memories of the soul's beatific vision of the idea.

Plato's writings exercised an inestimable influence on Aristotle, the Stoics, Cicero, Plutarch, the Neoplatonists, the Christian Fathers, the

earlier scholastics, the philosophy and poetry of the Renaissance in Italy and England, and on the nineteenth-century revival of historical and philosophical studies in Germany. His influence is rather increasing than diminishing in the higher literature and scholarship of our own time. Nor is it likely soon to wane. To borrow his own half-mystical imagery, he purges the eye of the soul, that it may discern spiritual truth, and converts it from the observation of the transient shadows of the fire-lit cave to the contemplation *sub specie aeternitatis* of the abiding forms of pure being illumined by the idea of good.

Bibliography. The best critical edition of the text is that of Schanz, still incomplete. Good and convenient texts abound—in the Teubner Series, in the Didot Bibliotheca, and that now in course of publication at Oxford. The chief complete annotated edition is that of Stallbaum with Latin notes (12 vols., 1821-28), parts of which have been reëdited by other scholars. Campbell's *Theætetus*, *Sophistes*, and *Politicus*, Jowett and Campbell's *Republic*, Archer Hind's *Phædo* and *Timæus*, Bury's *Philebus*, and Adam's *Republic* are well known. School and college editions of the *Apology* and *Crito*, the *Protagoras*, *Gorgias*, *Meno*, and *Euthyphro* abound. Jowett's translation (3d ed.) supersedes all others for English readers. Another good translation, by H. N. Fowler, is in progress in the Loeb Classical Library (New York, 1913 et seq.). Grote's four volumes of summary and comment cite the literature down to the year 1866. The volume on Plato in the last edition of Zeller's *History of Greek Philosophy* is a full, scholarly treatment of the whole subject. Professor Ritchie's *Plato* (New York, 1902) is a readable sketch. For the right understanding of Plato, however, the best guide is Mill's review of Grote (*Dissertations and Discussions*, vol. iv, p. 227), supplemented where unsympathetic by Walter Pater, *Plato and Platonism* (New York, 1893), and Emerson's essay on *Representative Men*. Consult also: Theodor Gomperz, *Greek Thinkers*, vols. ii, iii (Eng. trans. by G. G. Berry, New York, 1905); J. A. Stewart, *The Myths of Plato* (London, 1905); J. E. Sandys, *A History of Classical Scholarship* (3 vols., Cambridge, 1906-08); W. C. Wright, *A Short History of Greek Literature* (New York, 1907); J. A. Stewart, *Plato's Doctrine of Ideas* (Oxford, 1909); A. E. Taylor, *Plato* (ib., 1908); P. E. More, *Shelburne Essays*, 6th series (New York, 1909); J. Adam, *The Religious Teachers of Greece* (2d ed., Edinburgh, 1909); C. Ritter, *Platon: sein Leben, seine Schriften, seine Lehre*, vol. i (Munich, 1910); id., *Neue Untersuchungen über Platon* (ib., 1910); A. E. Taylor, *Varia Socratica* (Oxford, 1911); Paul Shorey, *The Unity of Plato's Thought* (Chicago, 1903); id., numerous reviews of books on Plato in *Classical Philology*, vols. i-ix (ib., 1906-14), and especially "Plato's Laws and the Unity of Plato's Thought," Part I, in *Classical Philology*, ix (ib., 1914); Christ-Schmid, *Geschichte der griechischen Literatur*, vol. i (5th ed., Munich, 1908; vol. i, part i, 6th ed., 1912).

PLATO'DA. See PLATYHELMINTHES.

PLATONIC BODIES. See POLYHEDRON.

PLATO OF TIVOLI, or TIBURTINUS (c.1120). A translator of Arabic mathematical manuscripts. He is known chiefly for his translation of the trigonometry and astronomy of

Al Battani. Among his contemporaries are Gherardo of Cremona, Athelard of Bath, and John of Seville, likewise known for their translations of Arabic mathematical manuscripts into Latin.

PLATOON' (Fr. *peloton*, platoon, tennis ball, dim. of *pelote*, OF. *pelote*, *pelotte*, ball, from ML. *pilota*, dim. of Lat. *pila*, ball). A term formerly used to designate a body of troops who fired together. In its modern sense, in the United States army, it is applied to one of the two, three, or four subdivisions into which a single company may be divided. A platoon, in war, must not consist of less than two nor more than four squads. A squad is eight men. Platoons are assigned to the lieutenants and non-commissioned officers, in order of rank, as follows: 1, right; 2, left; 3, right centre; 4, left centre. In the same way the word "platoon" is used to designate the main subdivisions of a battery of artillery or of a troop of cavalry.

PLATOV, plát'of, MATVEI IVANOVITCH, COUNT (1751-1818). A Russian general. He was born on the banks of the Don, August 17 (6), 1751, and was of Greek descent. Entering the Russian army in 1765, he distinguished himself in the wars against Turkey and France, so that in 1801 he was appointed by Alexander I hetman of the Cossacks and lieutenant general. In the War of 1812, after the French had evacuated Moscow, Platov hung upon their rear with the utmost pertinacity, and French historians state that Napoleon's army suffered more from him than from privation and exhaustion. After crossing the Prussian frontier Platov occupied Marienwerder and other cities. On May 28, 1813, he defeated Lefebvre at Altenburg. To the French, retreating from Leipzig, he showed no mercy, and subsequently he gained a victory over them at Laon. In 1814 he took Nemours and later entered Paris with the allies. His undisciplined bands committed depredations everywhere, but the leader was loaded with honors. Alexander made him Count in 1812. A monument to him was erected at Novoherkassk on the Don. Consult Aubin, *Trente-neuf portraits* (St. Petersburg, 1902).

PLATT, CHARLES ADAMS (1861-). An American landscape architect, painter, and etcher. He was born in New York City and studied at the schools of the National Academy of Design and the Art Students' League. In 1882 he went to Paris, where he worked for four years under Boulanger and Lefebvre and exhibited at the Salon. His early paintings, largely views of New England, are smooth of surface, but truthful in color and sympathetically handled. Among the best are "Clouds," which was awarded the Webb prize offered by the Society of American Artists (1894), and "Snow" (1900). Later he turned to landscape gardening and architecture. As an etcher he produced some excellent work, especially in his treatment of water, selecting his subjects principally from the life of Dutch fishermen and from scenes in Holland. He is the author of *Italian Gardens* (1892) and was made a National Academician in 1911.

PLATT, ORVILLE HITCHCOCK (1827-1905). An American statesman, born at Washington, Conn. He was educated at Gunn's Academy, Washington, studied law at Litchfield, Conn., and was admitted to the bar in 1849. He practiced law at Meriden, was clerk of the State Senate in 1855-56, and the next year was

Secretary of State of Connecticut. He was elected as a Republican to the State Senate for the term 1861-62, and to the State House of Representatives in 1864 and 1869, the latter year being chosen Speaker. On March 18, 1879, he succeeded William H. Barnum, Democrat, in the United States Senate, where he continued to serve until his death. He received the Yale LL.D. in 1887. On Feb. 25, 1901, he reported from the Committee on Relations with Cuba an amendment, famous as the Platt Amendment, to the Army Appropriations Bill, which stated in part "That the Government of Cuba consents that the United States may exercise the right to intervene for the preservation of Cuban independence, the maintenance of a government adequate for the protection of life, property, and individual liberty." This amendment, framed by Platt and Senator Spooner, was of far-reaching importance in regulating the relations of the two countries. Under it the United States intervened twice in Cuba (q.v.), and it was thought by some that it virtually established a protectorate; but the authors denied any such intention. The amendment was accepted by Cuba and made a part of the constitution. Because of his votes against the Sherman Anti-Trust Law, the Eight-Hour Labor Act, and the Anti-Injunction Bill, Platt was denounced by the labor organizations and was considered a reactionary. Consult L. A. Coolidge, *An Old-Fashioned Senator: Orville H. Platt* (New York, 1910).

PLATT, THOMAS COLLIER (1833-1910). An American political leader. He was born at Owego, N. Y., studied at the Owego Academy, and entered Yale College in 1849, but withdrew in his junior year on account of ill health. He then went into business as druggist, became president of the Tioga National Bank, and invested largely in lumbering in Michigan. He was clerk of Tioga County in 1859-61 and a member of Congress from 1872 to 1876. In 1870 he became the friend and political ally of Conkling and a subordinate leader in the Republican party. In 1879 he was made secretary and director of the United States Express Company and in 1880 became its president. He also acted as president of the Southern Central and other railways. In 1880 he was appointed a quarantine commissioner at the port of New York. In 1881 he was elected United States Senator, but within a few months both he and Senator Roscoe Conkling, his colleague from New York, resigned because President Garfield did not defer sufficiently to their wishes in making appointments in New York. Platt claimed that he "induced" Conkling to resign, although the latter wanted to fight the matter out in the Senate. The immediate occasion of their resignation was the appointment by Garfield of W. H. Robertson as collector of the port of New York City. (See CONKLING, ROSCOE; ROBERTSON, W. H.) In an appeal to the Legislature for reelection they were both defeated, although Platt withdrew before the final vote. After the defeat of Conkling, however, Platt gained virtual control of the Republican organization in New York, becoming finally the so-called "easy Boss," and was again elected to the Senate in 1897 and 1903. He was a delegate to all the Republican national conventions from 1876 until his death, as well as a member of the National Republican Committee. He claimed that he secured the nomina

tion of Roosevelt for Governor of New York and that he practically forced the latter to accept the nomination for Vice President in 1900. The relations of Platt and Roosevelt were discussed at length in the Roosevelt-Barnes libel suit of 1915. Consult L. J. Lang (ed.), *The Autobiography of Thomas Collier Platt* (New York, 1910). See ROOSEVELT, THEODORE.

PLATTDEUTSCH, plät'doich, or Low SAXON. The language spoken in northern Germany from the border of Holland to the frontier of Lithuania. It is distinguished on the one hand from Low Franconian, which includes the language of Holland, Dutch proper (see DUTCH LANGUAGE), and on the other hand from Middle and Upper German, which are grouped together under the name High German. In common with other Low German languages, Plattdeutsch is distinguished from High German by the fact that its surd mutes have not passed through the second or High German sound shifting. (See GRIMM'S LAW) There is, however, no definite line of demarcation, some of the Middle German dialects not having shifted *p* and *t*. The best criterion of distinction is the so-called *ich-line* which starts on the Belgian border south of Limburg and runs in a northeasterly direction, crossing the Rhine at Benrath (between Düsseldorf and Cologne), the Elbe south of Magdeburg, the Oder just above Frankfurt, and finally reaches the Slavic frontier in the Province of Posen near Birnbaum. To the north of this line the first personal pronoun has the form *ik*, to the south *ich*. Within its district Plattdeutsch is generally spoken by the lower classes, while High German is the language of the school and pulpit and, as a rule, of the educated classes.

Plattdeutsch is not a homogeneous language, but consists of a number of different dialects which may be divided into two main groups: (1) Northeast Saxon, in Oldenburg, Bremen, Hamburg, Hanover, Brunswick, Holstein, Mecklenburg, Brandenburg, Pomerania, and East Prussia; (2) Westphalian, in Westphalia and the Principality of Waldeck. During the nineteenth century the dialect of Mecklenburg acquired especial prominence through the writings of Fritz Reuter.

Historically Low Saxon is divided into (1) Old Saxon or Old Low German, extending from the ninth to the twelfth century, (2) Middle Low Saxon, from the twelfth to the end of the sixteenth century, (3) Modern Low Saxon, Plattdeutsch, or Modern Low German, from 1600 to the present time.

In the Old Saxon period the principal literary monument is the *Heland* (q.v.), a religious epic of nearly 6000 lines in alliterative verse, written about 830 at the request of Louis the Pious. Several fragments of a versification of the first chapters of the Book of Genesis, an interlinear version of the Psalms, and various other smaller fragments of a religious character have been preserved, besides a number of glosses and proper names. Old Saxon may also lay partial claim to the *Hildebrand's Lay*, the most famous of all old German ballads, as it is written partly in this dialect.

The most noted prose document of the Middle Low Saxon is the *Sachsenspiegel*, a compilation of Saxon common law, made by Eyke von Repchow between 1224 and 1230, and which became the model for law books in other parts of Germany. From 1350 through the fifteenth century

there is an extensive Low German literature, which is mainly religious in character, consisting largely of legends of the Church and collections of hymns. Among secular poems may be mentioned *Reineke der Vos* (Lübeck, 1498) and *Flore und Blankfur*. About the middle of the seventeenth century Low Saxon ceased to be a literary language, the last Low Saxon Bible appearing at Goslar in 1621. In modern times what little literature has appeared has been of a decidedly dialectical character. Especially prominent are Fritz Reuter (q.v.), best known for his humorous novel *Ut mine Stromtid* and the poem *Hanne Nute* and Klaus Groth (q.v.), a writer of lyric poems, as the *Quickborn*.

H. Gallée, *Altsächsische Grammatik* (Halle, 1910).

PLATTENSEE, plät'ten-zä The largest lake of Hungary. See BALATON, LAKE

PLATTER, plät'ter, THOMAS (1490-1582). A Swiss printer, scholar, and educator, born near Visp, in Canton Valais. He was a goatherd in his boyhood, then saw Germany as a traveling scholar, and later studied under Myconius at Zurich. He labored as a ropemaker at Basel at the same time that he was serving as professor of Hebrew and (later) of Greek. For six years he maintained a printing establishment. His autobiography, written at his son's request in 14 days, when the father was 73, gives a remarkable picture of the times, supplemented by that of his son, FELIX PLATTER (1536-1614), a doctor of medicine and instructor at Basel. The two biographies were edited by Heman (Gütersloh, 1882). Consult Paul Mourde, *Thomas Platter and the Educational Renaissance of the Sixteenth Century* (New York, 1904).

PLATTE (plät) **RIVER**. The principal river in Nebraska and in respect of the area which it drains (about 84,600 square miles) the most important tributary of the Missouri. It is formed by the North and South Platte rivers, which unite in Lincoln Co., Neb. (Map: Nebraska, G 3).

The North Platte rises in the mountains which surround North Park in northern Colo-

rado, flows northward into Wyoming, turns southeast to its junction with the South Platte. At Pinkhampton, Colo., the stream is about 8000 feet above the sea level. Its length is about 650 miles, and its drainage basin includes about 28,500 square miles, of which about 20,000 are in Wyoming and 7000 in Nebraska.

The South Platte rises near the centre of Colorado. Its drainage basin includes about 24,000 square miles and contains the oldest cultivated and irrigated areas in Colorado. From the junction of the North and South Platte rivers the main stream flows eastward across Nebraska for somewhat more than 200 miles and enters the Missouri at Plattsmouth, about 10 miles south of Omaha. Its western reaches are extensively used for irrigation. It is too shallow for commercial navigation.

PLATTEVILLE. A city in Grant Co., Wis., 135 miles west by south of Milwaukee, on the Chicago, Milwaukee, and St. Paul and the Chicago and Northwestern railroads (Map: Wisconsin, C 6). It is the seat of a State normal school, the State School of Mines, and a State school for the deaf, and it contains a Carnegie library. The surrounding country is agricultural, with important mining interests. Zinc mining, recently developed, has attained great importance. Several large zinc and lead mines are worked in or near the city. There are also manufactories of wagons, creamery products, beer, cigars, etc. The water works are owned by the municipality. Platteville was settled in 1827. Pop., 1900, 3340; 1910, 4452.

PLATTNER, plát'nēr, KARL FRIEDRICH (1800-58). A German metallurgist, born at Kleinwaltersdorf, Saxony. He was educated at Freiberg, and, having become an inspector and assayer for the royal mines in Saxony, worked out methods of blowpipe analysis for metals. In 1840 he became chief of the royal department of assaying and in 1842 was made professor of metallurgy at the Bergakademie of Freiberg. His *Die Probierkunst mit dem Lötrohr* (1835; 7th ed., 1907) was translated into English as *Manual of Qualitative and Quantitative Analysis with Blowpipe* (8th ed., 1902).

PLATTNER PROCESS. See CHLORINATION; GOLD.

PLATTSBURG. A city and the county seat of Clinton Co., N. Y., 167 miles north by east of Albany, on Lake Champlain, at the mouth of the Saranac River, and on the Delaware and Hudson and the Chateaugay railroads (Map: New York, G 1). It is picturesquely situated on Cumberland Bay, which affords a fine harbor, and is an attractive resort as well as the centre of a large territory popular in summer. Plattsburg is the seat of a State normal and training school and has a public library and four other libraries. The Plattsburg Barracks (q.v.) are among the largest in the United States. There are also the Federal government building, the courthouse and jail, a monument to Samuel Champlain, and homes for aged women and for friendless children. The Catholic Summer School of America (q.v.) convenes at Cliff Haven, 2 miles south of the village. Plattsburg is a port of entry of the St. Lawrence customs district, the trade of which in 1915 comprised exports valued at \$32,257,643, and imports to the amount of \$28,275,724. It controls extensive lumber interests, and among its industrial establishments are lumber mills, wood-pulp mills, foundries

and machine shops, flouring and woolen mills, manufactories of sewing machines, wall paper, toilet paper, etc. The water works are owned and operated by the municipality. Pop., 1900, 8434; 1910, 11,138; 1915 (State census), 10,360.

Plattsburg was settled in 1784 by a company from Poughkeepsie and Long Island, headed by Zephaniah Platt, and was incorporated in the following year. Off Valcour Island, near by, on Oct. 11, 1776, occurred the first naval battle ever fought between British and American fleets. During the War of 1812 Plattsburg was the headquarters of the United States forces on the northern frontier, and on Sept. 11, 1814, in Plattsburg bay, Commodore Macdonough defeated a British fleet in the famous battle of Lake Champlain (see CHAMPLAIN), while on the land General Macomb repulsed a superior British force. In 1849 and again in 1867 Plattsburg suffered severely from fire, the greater part of the business portion being destroyed each time. A government military training camp was held at Plattsburg in 1915. Consult Palmer, *History of Plattsburgh* (Plattsburg, 1877).

PLATTSBURG BARRACKS. A United States military post, established in 1838 and occupying a reservation of about 703 acres in extent, on the west side of Lake Champlain, on the southern edge of Plattsburg, N. Y., and reached by the Delaware and Hudson Railroad. The post has quarters for a regiment of infantry, which is the usual garrison. Plattsburg Barracks frequently has been selected as the site of a practice camp for college and business men undergoing special military instruction in summer. United States troops were first stationed on the ground in 1812.

PLATTSMOUTH. A city and the county seat of Cass Co., Neb., 18 miles south of Omaha, on the Missouri River at the mouth of the Platte and on the Missouri Pacific and the Chicago, Burlington, and Quincy railroads (Map: Nebraska, J 3). It has a public library, and among its finest buildings are the courthouse, opera house, and the high school. The industrial establishments include the Burlington Railroad shops, brick and terra-cotta works, and cigar factories. There is considerable trade with the tributary region, which is interested mainly in agriculture and stock raising. Platts-mouth is governed by a mayor, elected biennially, and a unicameral council. Pop., 1890, 8392; 1900, 4964; 1910, 4257.

PLATYCERAS, plát-tis'ēr-as (Neo-Lat., from Gk. πλατύς, *platys*, flat, broad + κέρας, *keras*, horn). A genus of fossil snail shells of the gastropod family Capulidae, found in rocks of Upper Cambrian to Triassic age. They are shaped somewhat like a liberty cap with the apex of the shell enrolled in a close spiral of small size and with the outer or body whorl of the shell rapidly enlarging to an irregularly expanded aperture. *Platyceras* is most abundant in the Niagaran, the Devonian, and the Subcarboniferous formations, and the genus is more or less an index fossil of Devonian age. The genus *Orthonychia* includes straight or slightly rounded platycerid shells of Silurian to Carboniferous age. Consult: Keyes, "The *Platyceras* Group of Paleozoic Gastropods," in *American Geologist*, vol. x (Minneapolis, 1892); "Attachment of *Platyceras* to Palaeocrinoidea, and its Effect in Modifying the Form of the Shell," in *Proceedings of the American Philo-*

sophical Society, vol. xxv (Philadelphia, 1888); J. M. Clarke, "The Beginnings of Dependent Life," in *New York State Museum Bulletin*, No. 121 (Albany, 1908).

PLATYCRINUS (Neo-Lat., from Gk. *πλατύς*, *platys*, flat, broad + *κρίνον*, *krinon*, lily). A genus of crinoids of the order Camerata that appears in the American Devonian strata and is abundant in the Lower Carboniferous. It is the typical genus of the family Platycrinidae, which are characterized by their ring of five large plates without special anal plate. See CRINOIDEA.

PLATYHELMINTHES (Neo-Lat. nom. pl., from Gk. *πλατύς*, *platys*, flat, broad + *ἐλμύς*, *helmys*, worm), or **PLATODA**. A phylum of invertebrate animals (flatworms), easily recognized by the absence of a body cavity and anus. There is no blood system, the results of digestion being carried to the different parts of the body by branches of the intestine. The body is flattened dorsoventrally, so that it is often thin and leaflike. The surface is covered with cilia in most of the free-living forms, but in parasitic forms is usually smooth and somewhat chitinous. The muscular system is well developed and remarkably complex, so that almost any sort of movement is possible to these worms. The digestive system is usually very well developed and highly varied, but in some forms is wholly wanting. The nervous system consists of a ganglion above the œsophagus, and two lateral nerve cords, connected by transverse commissures. Other longitudinal trunks are sometimes present, and rarely the transverse commissures are wanting. A very characteristic and remarkable set of fine tubes ramifies through the body and apparently serves as an excretory system. Sense organs of various kinds occur in the free-living forms, but are usually wanting in those which are parasitic. Occupying a large part of the body and often nearly the whole space inside the skin, are the reproductive organs, and the fertilization of the egg is in almost all cases internal. The Turbellaria are hermaphroditic. The eggs are very numerous, provided with considerable yolk and covered by a shell, but some planarians multiply by fission, and when cut in pieces each piece may eventually become a well-formed planarian. The young undergo a metamorphosis and development sometimes very complex. The phylum is usually divided into three classes: (1) Turbellaria, free-living flatworms, with the surface ciliated; (2) Trematoda, parasitic, usually leaflike, flatworms having a well-developed digestive system; (3) Cestoda, the tapeworms, usually elongated, jointed, and without a digestive system. Consult Benham, in Sir E. R. Lankester, *Treatise on Zoology*, vol. iv (London, 1901), and Parker and Haswell, *Textbook of Zoology* (New York, 1910). See CESTODA; FLATWORM; TREMATODA.

PLATYPUS. See DUCKBILL.

PLATYRRHINI. The American monkeys. See MONKEY.

PLATYSTROPHIA (Neo-Lat. nom. pl., from Gk. *πλατύς*, *platys*, broad, flat + *στροφίον*, *strophion*, band). A hinged brachiopod very abundant and eminently characteristic of the Middle Ordovician formations, of which it is a well-known index fossil. Its shell is transversely elongated, with a long straight hinge line and low hinge areas. The convex valves are of about equal size, and their surfaces are marked by a number of strong angular radiating

folde. Two species, *Platystrophia lynce* and *biforata*, with numerous varieties, are common in the Trenton and Cincinnati groups of North America and in equivalent strata of Europe and elsewhere. This genus was originally included under *Orthis*.

PLAUEN, *plou'en*. A town of Saxony, Germany, on the White Elster, 21 miles southwest of Zwickau (Map: Germany, E 3). Most of its public buildings are modern. Among the most noteworthy are the castle, dating from the seventeenth century, the Rathaus, and the theatre. The educational institutions include a Gymnasium, a Realschule, a seminary for teachers, and a number of special schools. Plauen occupies a prominent place among the manufacturing cities of Germany, being the chief centre for the production of white cotton goods, viz., lace curtains, muslin, cambric, mull, batiste, various embroidered goods, etc. It also manufactures machinery, safes, pianos, paper, beer, etc. The population of the town increased from 73,801 in 1900 to 121,272 in 1910. The inhabitants are principally Protestants. The manufacturing of white goods was introduced at the end of the sixteenth century from Switzerland.

PLAUTIA, *plá'shi-á*, (or **PLOTIA**) **GENS**. A Roman plebeian gens, several members of which became consuls. It embraced the family names Hypsæus, Proculus, Silvanus, Venno, and Venox.

PLAUTUS, **TITUS MACCIUS**. The greatest comic poet of ancient Rome. He was born c.254 B.C. at Sarsina, a village of Umbria. It is probable that he came to Rome while still a youth and there acquired a complete mastery of the Latin language in its most idiomatic form as well as an extensive familiarity with Greek literature. It is uncertain whether he ever obtained the Roman franchise. His first employment was with the actors, in whose service he saved an amount of money sufficient to enable him to commence business on his own account. What the nature of this business was, or where he carried it on, we are not informed; we know, however, that he failed in it and returned to Rome, where he had to earn his livelihood in the service of a baker, with whom he was engaged in turning a hand mill. (Consult Aulus Gellius, *Noctes Atticæ*, iii, 3.) At this time—a few years before the outbreak of the second Punic War—he was probably about 30 years of age; and while employed in his humble occupation he composed three plays, which he sold to the managers of the *ludi*, or public games. (See GAMES, ANCIENT.) The proceeds enabled him to leave the mill and turn his hand to more congenial work. The commencement of his literary career may therefore be fixed c.224 B.C., from which date he continued with wonderful fertility to produce comedies till 184.

Of his numerous plays—130 bore his name in the last century of the Republic—only 21 have come down to us (of these several are incomplete). Of the 130, however, many were regarded by the Roman critics as not from Plautus's hand; indeed, Varro (in his treatise *Questiones Plautinæ*, cited by Gellius) limited the genuine comedies of the poet to 21. This list of 21 no ancient author names; but, since Varro's great authority would probably give currency in learned and other circles to the plays selected by him, it is quite possible that the surviving plays are, in fact, those named by Varro. Their titles are: (1) *Amphitruo*, (2)

Asinaria, (3) *Aulularia*, (4) *Bacchides*, (5) *Captivi*, (6) *Curculio*, (7) *Casina*, (8) *Cistellaria*, (9) *Epidiculus*, (10) *Mostellaria*, (11) *Menæchmi*, (12) *Miles Gloriosus*, (13) *Mercator*, (14) *Pseudolus*, (15) *Pœnulus*, (16) *Persa*, (17) *Rudens*, (18) *Stichus*, (19) *Trinummus*, (20) *Truculentus*, (21) *Vidularia*. As a comic writer Plautus enjoyed immense popularity among the Romans and held possession of the stage down to the time of Diocletian. The vivacity, the humor, and the rapid action of his plays, as well as his skill in constructing plots, his marvelous mastery of the Latin language, and his possession, when he chose to display it, of a narrative style comparable to that of Terence (q.v.) himself, commanded the admiration of the educated no less than of the unlettered Romans; while the fact that he was a national poet prepossessed his audiences in his favor. These same qualities have won him many admirers in modern times. Although he laid the Greek comic drama under heavy contributions and "adapted" the plots of Menander, Diphilus, and Philemon with all the license of a modern playwright, he always preserved the style and the character native to the Romans and reproduced the life and the intellectual tone of the people in a way that at once conciliated their sympathies. The admiration in which he was held by his contemporaries descended to Cicero and St. Jerome; while he has found imitators in Shakespeare, Molière, Dryden, Addison, and Lessing, and translators in most European countries. The best complete translation of his works into English is that by Thornton and Warner (5 vols, 1767-74), there is another by Riley (London, 1880), and a partial translation in the original metre, by Sugden (London, 1893). The first volume of a translation in the Loeb Classical Library, by P. Nixon, is soon to appear. Unfortunately the text of the extant plays is in such a very corrupt state that much yet remains to be done by the grammarian and the commentator before they can be read with full appreciation or comfort. Ritschl (q.v.) and his disciples gave the text its first exhaustive recension, on which are based the modern editions, such as those of Using (5 vols., Copenhagen, 1875-86), Goetz and Schoell (3 vols., Leipzig, 1893-96), F. Leo (2 vols., Berlin, 1896), W. M. Lindsay (2 vols., Oxford, 1904-05). Parts i-vii of a *Lexicon Plautinum*, by G. Lodge, carrying the work down to *hercle*, have appeared (Leipzig, 1901-14). Among the many good editions of separate plays, with commentary, may be mentioned those of Brix, Lorenz, Palmer, Fay, Goetz, Lindsay, Sonnenschein, Schoell, and Tyrrell. Consult W. Y. Sellar, *Roman Poets of the Republic* (3d ed., Oxford, 1889); Martin Schanz, *Geschichte der römischen Literatur*, vol. i, part i (3d ed., Munich, 1907); J. W. Duff, *A Literary History of Rome* (London, 1909). On the language of Plautus, consult W. M. Lindsay, *The Syntax of Plautus* (Oxford, 1907), and C. E. Bennett, *The Syntax of Early Latin*, vols. i-ii (Boston, 1910-14). On the metres of Plautus, see the "Introduction" to W. M. Lindsay's *editio maior* of the *Captivi* (London, 1900), and the authorities there cited. For a report on the whole array of writings on Plautus, from 1895 to 1912, whether in books or in the periodicals, consult W. M. Lindsay, "Jahresbericht über Plautus," in Burian's *Jahresbericht über die Fortschritte der klassischen Altertumswissenschaft* for 1906 and

1912 (Leipzig); for imitations and adaptations of Plautus, Karl von Reinhardtstoettner, *Plautus, Spätere Bearbeitungen plautinischer Lustspiele* (Leipzig, 1886).

PLAY, PIERRE GUILLAUME FRÉDÉRIC. See LE PLAY, P. G. F.

PLAYA, *plá'yá* (Sp., shore). The name given to mud plains formed by the deposition of silt in temporary lakes. In arid regions, such as the Great Basin, water collects in the valleys during the dry season, forming shallow lakes, which shrink or entirely disappear with the recurrence of dry weather. The sediment left by evaporation consists of finely divided rock debris which is impregnated with salt and becomes very hard under the sun's heat. The Black Rock Desert, in northwestern Utah, is a good example of a playa.

PLAYERS' CLUB, THE. A social club in New York City composed of men identified with American art, literature, painting, sculpture, architecture, the drama, etc., as well as prominent bankers and lawyers. Its creation was owing in a great measure to the liberality of the tragedian Edwin Booth (q.v.), to whom the club is indebted for its handsome club house at 16 Gramercy Park, New York City. It was purchased by Mr. Booth for \$75,000 and entirely remodeled. The work was completed in 1888, and on December 31 of that year it was formally presented, furnished and equipped for all the needs of club life. The club had been organized after the purchase of the building. Its affairs are managed by a board of nine directors, who must be identified with literature and the drama, and at least five of the body must be actors, dramatic writers, or theatrical managers.

PLAYFAIR, JOHN (1748-1819). A Scottish mathematician and geologist, born at Benvie. He was taught by his father until he was 14 years old, and he graduated from St. Andrews at 17. He entered the ministry in 1770, but devoted his leisure time to mathematical studies and in 1779 contributed to the *Transactions* of the Royal Society a paper "On the Arithmetic of Impossible Quantities." In 1785 he became professor of mathematics, jointly with Dr. Adam Ferguson, at Edinburgh. For many years he was general secretary of the Edinburgh Royal Society. In 1805 he exchanged his chair of mathematics for that of natural philosophy, and in 1807 he became a fellow of the Royal Society. A few years before his death Playfair traveled through France, Switzerland, and Italy to study geological and mineralogical features. From 1804 onward he was a frequent contributor to the *Edinburgh Review*, all his reviews being reprinted in the fourth volume of the collected edition of his works, edited by James G. Playfair (4 vols., 1822). He also contributed to the *Encyclopædia Britannica* and to the *Transactions* of the Royal Society of Edinburgh, edited Euclid's *Elements* (1795), and wrote *Outlines of Natural Philosophy* (2 vols., 1812-16) and *Illustrations of the Huttonian Theory of the Earth*.

PLAYFAIR, LYON, first BARON (1818-98). A British scientist and statesman, born at Chunar in Bengal. He was educated at St. Andrews and at Glasgow, where he took a course in chemistry. After studying under Liebig at Giessen, where he graduated Ph.D., he was honorary professor of chemistry at the Manchester Royal Institution in 1843-45. From

1858 to 1869 he held the chair of chemistry in Edinburgh University. Playfair sat in Parliament as a Liberal from 1868 to 1885, representing the Scottish universities and then until 1892 Leeds. He was appointed Postmaster-General in 1873 and became Privy Councillor; in 1892 was raised to the peerage and appointed a lord in waiting. He wrote: *Science in its Relation to Labor* (1853); *On Primary and Technical Education* (1870); *Science in Relation to the Public Weal* (1885); *Subjects of Social Welfare* (1889).

PLAYGROUNDS AND RECREATION CENTRES. Towards the close of the nineteenth century a great awakening to the needs and rights of children spread throughout Europe and America. Legislation prohibiting or regulating the employment of children in all forms of industry, compulsory education laws, and finally public provision for the children's hours of play were among the forms taken by this awakened interest in child welfare. In the early decades of the twentieth century in response to this need the playground movement was making rapid progress, a movement which included not only the provision of ample playgrounds but also of trained directors on these grounds who would supervise the children's play. The history of the play movement goes back to the rise of the kindergarten in 1826 and is but another application of Fröbel's teaching that the older people should live with the children and share their play. Later John Fiske pointed out the significance of the prolonged period of infancy in the human race and that the child, like other young animals, "does not play because it is young, but rather is allowed a period of infancy in order that it may play," for in play and not in work or in study every side of the child's nature, physical, emotional, and intellectual, is unified and developed.

The forerunner of the playground in the United States was the New England "common," where the boys met to play that peculiarly American game, baseball. It is not surprising, therefore, that the New England city of Boston led in the provision of children's playgrounds, which have been in existence there since 1882. New York was not far behind, portions of Central Park having for years been set aside as children's playgrounds, and in 1887 there was a general movement for the establishment of municipal playgrounds throughout the city and especially in the congested tenement-house district. In that year an Act was passed by the State Legislature permitting an annual expenditure of \$1,000,000 for the establishment of small parks. In May, 1888, the New York Society for Parks and Playgrounds for Children was incorporated under a special law giving the society unusual powers, including the appointment of special police. In 1894 the Tenement House Commission secured the adoption of a law which provides for at least two parks on the lower East Side "to be furnished in part as public playgrounds." The first of these plots was opened to the children in 1900. It was merely a bare piece of ground with no apparatus for children's games and no directors. Under such management it did very little good. The management of the second of these plots, known as Seward Park, was assumed by the Recreation League, an organization devoted to work of this character; apparatus was obtained and

directors secured to help the children in their games, the entire cost of equipping and operating the playground being paid by the league. The playground was opened to the public on June 3, 1899. From the start it was immensely popular with the children and an effectual proof of the feasibility and usefulness of such undertakings. In 1903 various other parks were opened as playgrounds.

Another branch of the work of furnishing playgrounds for the children of New York was undertaken in 1898. In that year the school boards of Manhattan and the Bronx appointed a committee for the management of summer playgrounds, appropriated \$15,000 for the work, and 20 playgrounds attached to public schools were opened. Apparatus for games and gymnastics were supplied the children, and a director was appointed to take charge of each playground. The daily attendance in the playgrounds averaged from 300 to 1000 children, and many had to be turned away.

The work of securing playgrounds in New York City is similar to the earlier attempts made in other of the larger cities to provide for the children's hours of play. According to Baker's *Municipal Year Book* (New York, 1902) 187 cities were operating public playgrounds in 1901. Contemporaneously a similar work has been going on in the principal European cities, with Glasgow in the lead. In 1907 the first of the Annual Play Congresses was held at Richmond, and the Playground and Recreation Society of America was organized, with permanent headquarters in New York City. It published a monthly magazine, *The Playground*, devoted exclusively to play interests. In 1914 the association published a recreation census which is summed up in the accompanying table.

Playground and recreation centres	Number of cities
Under paid supervision	342
Under volunteer supervision	22
Under no supervision	59
School playgrounds	149
	<hr/> 572
Work started:	
Recreation superintendents appointed	3
Playground associations and commissions organized	14
Committees appointed	8
Land secured	26
Money raised	8
Bond issues secured	2
Municipal appropriations and bond issues requested	3
	<hr/> 64

In addition, 31 cities reported that steps were being taken to arouse interest and that the movement was being agitated. In the 324 cities having paid supervision there were 2402 playgrounds and recreation centres, with 6318 play leaders, and a total expenditure of \$5,700,224 for the year. In addition to the sum just named bonds to the amount of \$2,358,000 were authorized by 20 cities.

Ownership and Management. In the early years public playgrounds were operated, if not owned, at private expense, but the work was rapidly assumed by municipalities and paid as part of the city budget. In 1913 the work was supported by public funds in 111 cities and partially so in 115 more. In some cities the management is assumed by city departments already in existence, as the park department or the school board; in other cities some private

organizations, as an improvement association or woman's club, attempted the administration of the work; in about 32 cities the work was deemed worthy of the formation of a new department.

Leadership. It has been the universal experience that to be effective the playground or recreation centre must have responsible and competent leadership. In fact, those playgrounds that have been maintained—there are at least 300 of them—without it have been so unsuccessful as to form a definite danger of "autovaccination against playgrounds," for a playground without a director is as useless as a school without a teacher and is dangerous. To meet the demand for trained leadership training classes were maintained in 1913 in 59 cities, 35 of these cities reported 2638 students. Of the 6318 play leaders employed, 3856 were women. This is a profession that is bound to attract young men and women who have a talent for leadership, knowledge of children and of out-of-door sports, and a desire for a very real kind of social service. Social as well as athletic gifts are essential for story-telling, and folk dances are favorite forms of recreation.

With these public playgrounds many special forms of activity have been associated, as is shown by the following statement, published in 1914 by the Playground and Recreation Association:

"Boy Scouts were in action at the recreation centres in 56 cities, Camp Fire Girls in 21 cities. There was organized debating in 15 cities, dramatics in 37, evening entertainments in 53, folk dancing in 132, gardening in 67; industrial work in 112 cities, instrumental music in 38; lectures, 36; libraries, 56; moving pictures, 35, pageants, 44, self-government, 52, singing, 84; social dancing, 42, story-telling, 143, summer camps, 27, swimming in 83, tramping in 74 and wading in 75 cities. Of these, it is interesting that the leading activities at recreation centres were story-telling in 143 cities, folk dancing in 132, and industrial work in 112 cities."

In addition to the regular playgrounds many cities are attempting to provide a safe place for the children's play by setting aside certain streets. During the summer of 1914 the plan was extensively tried in New York City. Nineteen "play zones" were set apart by order of the police commissioner for play between 3 and 6:30 P.M. In at least 10 other cities this plan was adopted in 1914.

The attempt to provide adequate play space for children is only a part of that larger recreation movement which aims to provide places for legitimate amusement for all the people. Various attempts to meet this need have been made. The use of the public-school plant outside of school hours as a recreation centre was widely recommended and frequently tried; 357 schoolhouses were reported as so used in 1914. Another form of open-air enjoyment has been provided by several American cities in the form of recreation piers. These are simply second stories to the ordinary shipping piers, provided with roofs. They are open day and evening, and music and dancing are enjoyed at certain hours. Chicago has a most elaborate system of recreation centres, located in small parks of from 5 to 10 acres, in the neighborhood of the working people. Besides the usual playground equipment these have people's clubhouses, with indoor

gymnasium, assembly hall, reading room, and restaurant.

PLAYING CARDS. See CARDS.

PLAYS. See DRAMA.

PLAZA, plá'sá, LEONIDAS (?-). An Ecuadorian politician. He was educated at the University of Quito and afterward entered politics. In 1901 he was elected to the presidency by the Liberal party. He pursued an anticlerical policy and encountered much opposition. The church was placed under state control, new orders were forbidden, and the church property was confiscated by the state. At the close of his administration he retired from politics, but upon the death of President Estrada, in 1911, Plaza offered his services to the government and was opposed by General Montero, who declared himself Dictator. After the disgraceful scenes of 1912, which resulted in the murder of Alfaro and Montero, Plaza was again chosen President. He at once took steps to reestablish the credit of the country by meeting the payments on the foreign debt and labored to secure important sanitary improvements. His administration was disturbed by revolutionary outbreaks.

PLEA (OF. *plait*, *plaid*, *play*, Fr. *plaid*, from Lat. *placitum*, decree, suit, plea, opinion, from *placere*, to please). In common-law pleading the defendant's answer or defense, consisting either of a denial of the facts alleged in the declaration or a confession that they are true and a statement of new facts by which their legal effect is avoided or of facts tending to defeat the action itself. A *plea* is distinguished from a *demurrer* in that the latter admits the facts alleged in the declaration, but denies their sufficiency in law to constitute a cause of action, whereas a *plea* raises only a question of fact in the manner indicated above.

Pleas are usually classed as peremptory and dilatory, according to their purpose and nature. A peremptory plea is one which brings in issue the merits of the controversy, either by denying absolutely the facts alleged in the declaration, when it is known as a plea in bar, or by confessing that the facts alleged by the plaintiff are true and setting forth new facts, which, if true, will defeat the alleged cause of action. The latter is known as a plea in confession and avoidance. A dilatory plea is one which attacks the action itself because of some defect in pleading or practice and therefore does not involve the merits of the case.

In equity pleading a special answer of the defendant attacking the particular action is also called a plea. It differs from a demurrer in equity in that it attacks something not apparent on the face of the bill, and it does not put in issue the merits of the action.

In England, where common-law pleading has been abolished, the Judicature Acts (q.v.) provide that the defendant's answer shall be known as the statement of defense, and this is analogous to a plea. The term "pleas of the crown" was formerly used to designate criminal prosecutions in the name of the sovereign. In the United States wherever code pleading prevails the term "plea" is no longer employed, a defense of fact being presented by an answer; but the divisions of pleas are often referred to by courts and lawyers as descriptive of the nature of a defense set forth by an answer. See PLEADING.

PLEADING (from *plead*, from OF., Fr. *plaider*, from OF. *plait*, *plaid*, *play*, Fr. *plaid*, *plea*). As a generic term, the written allegation of facts upon which a party to any legal proceeding founds his claim or demand or his answer or defense thereto. Used in a broader sense, the term signifies the system of legal rules and principles applicable to the written pleadings in a legal proceeding. Pleading is only one of the successive steps in a proceeding at law by which one party asserts or enforces his rights against another, all together being comprehended by the term "procedure" (q.v.).

Common-Law Pleading. Originally the pleadings in an action at common law were oral, as is evidenced by many peculiarities of the common-law procedure of a later date; but as early as the reign of Edward III we find that the pleadings were in writing and usually in Latin. Pleading at law, however, ultimately developed into a system of highly technical and formal rules requiring the greatest precision in their application and often by their very formality and rigidity defeating rather than aiding justice. Although remedial statutes were passed as early as the reign of Elizabeth, no attempt at a general reformation of the system was made until 4 Wm. IV, c. 42, in 1834. The system of common-law pleading was generally adopted in the United States, but later this was superseded in many of the States by various forms of statutory or code pleading.

The principles upon which any system of pleading is necessarily based will perhaps be best understood by referring briefly to the more essential elements of the common-law system. The primary object of the pleadings in an action at common law was to raise a single issue or dispute upon a point either of law or of fact. In the former case a question was raised for decision by the court, usually after argument upon the question of law involved and submission of briefs by opposing counsel. In the latter a question was raised for decision by the jury after hearing evidence tending on the one side to prove and on the other to disprove the fact in dispute. And upon the decision of the court or a verdict of the jury final judgment was entered determining the rights of the parties to the controversy.

The first step towards accomplishing the object of pleading after service of summons or mandate of the court upon the defendant was the filing of the declaration (known in modern practice as the complaint) in court. In the declaration the facts were required to be stated according to their legal effect only, and it was not permissible to set out the evidence on which the plaintiff relied. Owing to the tendency of the early lawyers to adopt fixed forms of statement and to their adherence to precedent, the declaration was required to conform to one of

a limited number of rigid forms, and if a plaintiff could not adapt the state of facts upon which he based his right to recover to one of these forms, he was without remedy. See FORMS OF ACTION.

After the plaintiff had filed his declaration it was then incumbent upon the defendant to make some statement of his defense; otherwise, after a certain period, judgment would be taken against him by default. If the defendant conceived that the declaration, if taken as true, did not show sufficient grounds to justify the plaintiff's recovery (or, as it was said, did not state a cause of action), he could submit the question of its sufficiency to the court as a matter of law by filing a demurrer to the declaration. (See DEMURRER.) If, however, the defendant wished to deny any of the allegations contained in the declaration, he might do so by filing a formal denial, his pleading in that case being known as a plea by way of traverse. An issue of fact was thus raised for decision by the jury.

It might happen, however, that the defendant, while admitting the truth of all the allegations in the declaration and admitting that it was legally sufficient, relied upon the existence of new or other facts sufficient to excuse him from the liability charged in the declaration, in which case his plea took the form of a confession and avoidance (q.v.). The plaintiff might then plead, setting up either a demurrer to the plea or a denial with the effect already described; or he in turn might plead by way of confession and avoidance and thus cast upon the defendant the burden of pleading again. In every case the pleadings were thus continued until a single issue of law or fact was raised, and the determination of that issue determined the rights of the parties to the litigation. Any plea of a defendant, such as has been described, setting up some matter of defense to the plaintiff's claim was known as a plea in bar or as a plea to the merits. It might happen, however, that the defendant wished to insist upon some matter which, though not a complete defense to the plaintiff's claim, was sufficient to show that the action was brought in an improper manner, as that the plaintiff was a married woman and had not joined her husband as plaintiff, or that the court had no jurisdiction, or that the defendant was not properly named. Such a plea was known as a plea in abeyance. The effect of a plea in abeyance, if successful, was to cause a dismissal of the plaintiff's action without prejudice to a second action if properly brought. If unsuccessful, the defendant was allowed to plead again to the merits.

The successive pleadings in an action, beginning with the plaintiff's pleading, were named the declaration, plea, replication, rejoinder, surrejoinder, rebutter, and surrebutter. Although theoretically possible, it was not usual for the proceedings to continue beyond the rebutter or surrebutter.

Upon the trial of an issue of fact, as the character of the issue was determined by the pleadings, it necessarily followed that the relevancy of all evidence offered at the trial was also primarily determined by the pleadings. Upon the entry of judgment all the pleadings in the case, together with the judgment constituting the judgment roll, were filed with the clerk of the court, thus constituting a complete permanent record of the case.

Owing to the highly technical and formal nature of the common-law system, the practice grew up of deciding the rights of litigants upon purely formal grounds, and judgment was frequently taken against a party upon demurrer because he had failed to state a perfectly valid claim or defense in the proper form. This was corrected to some extent by the Statute of 27 Eliz., c. 5, § 1, which provided that no advantage should be taken of defects of form, except by a special demurrer which should state specifically the formal defect objected to. The Statute 4 Anne, c. 16, § 1, was enacted for more effectively accomplishing this result, and 15 and 16 Vict., c. 76, §§ 50-52, abolished the special demurrer and required all defects of form to be taken advantage of by motion before trial. This is generally the modern practice. The Statute of Anne referred to allowed the defendant to plead several pleas to the same declaration, thus breaking down to some extent the principle of singleness of issue. Through laxity of practice also the defendant was allowed in his plea to make use of a general denial, known as the general issue, the effect of which in most actions was ultimately not only to deny all the essential allegations of the declaration, but to allow the defendant at the trial to prove many matters of affirmative defense. An attempt was made by Statute 4 Wm. IV, c. 42, to avoid the confusion and the frequently illogical results of this complicated system by authorizing the judges of the common-law courts to adopt certain rules modifying the common law of pleading as it then existed. These rules, known as the Hilary rules, were promulgated in 1834 and had for their principal object the narrowing of the general issue so as to make it conform more closely to a logical denial of the allegations in the complaint. These rules, however, did not succeed in accomplishing the desired result and seem only to have added to the confusion into which the subject had fallen. The law was substantially revised by 15 and 16 Vict., c. 76, and modern legislation has been enacted in all of the United States in which the common-law system has been modified.

Following are the more essential changes:

Matters of form are required to be taken advantage of by motion before trial, otherwise they are deemed to have been waived. Singleness of issue is not required, the defendant being allowed to use the general denial and to plead several matters by way of confession and avoidance. In many jurisdictions the number of successive pleadings is limited. Decisions upon demurrers are not necessarily final, the defendant being usually allowed to plead to the merits in case his demurrer is overruled.

Great freedom of amendment is allowed, a party being allowed to correct a defective pleading by amendment on application to the court, even at the trial of the action, if the rights of his opponent will not be prejudiced by the amendment. There are also many other changes, the general object being to make the system more simple and just in its application, and to avoid the determination of rights upon purely formal grounds.

Pleading at Criminal Law. At common law pleading in criminal actions was in its essentials substantially like pleading in civil actions, although much less elaborate.

The first pleading was called the indictment (q.v.). To this the accused might interpose

a demurrer, as in civil actions, and with like effect, except that if the demurrer were overruled he was allowed to plead to the indictment. All matters tending to show that the accused was not guilty of the offense charged might be shown under the oral plea *not guilty* or the plea *nolo contendere*, which was equivalent to guilty, except that it was not an admission by the defendant which could be used against him in evidence in a civil suit for the same act. After the plea no further pleading was necessary. The plea of abatement or previous conviction or acquittal of the same offense was required to be specifically pleaded as a plea by way of confession and avoidance; and to these the prosecution might demur with the same effect as a demurrer to a plea in abatement in a civil action.

Pleading at criminal law has been subjected to fewer statutory changes than pleading in civil actions. In some States less formality is required than at common law, and final judgment cannot be entered upon purely formal grounds. Formal defects may be cured by amendment, but there can be no amendment to matter of substance in an indictment, otherwise an amended indictment would not satisfy the requirement that the indictment must be found by the grand jury.

Equity Pleading. The system of pleading adopted in equity by the English Court of Chancery was derived partly from the common-law system and partly from the civil-law system as administered by the English ecclesiastical courts.

The important features of the civil-law system which characterize equity pleading were: (a) the absence of the denial or traverse, the rule being that all the allegations in a pleading were deemed to be denied unless expressly admitted by a subsequent pleading, which was exactly the converse of the common-law rule by which all the allegations in a pleading were deemed to be admitted unless expressly denied; and (b) the practice by which a party to the litigation could compel his opponent to testify, or give discovery, as it was called, in advance of argument or trial as to the matters alleged in the first party's pleading.

The plaintiff's pleading in an equity action is called the bill. In effect it is a petition addressed to the court asking that subpoena issue compelling the defendant to answer the bill. Formerly bills in equity were prepared with great formality and were usually composed of nine distinct parts. Of these, however, only four are important in modern practice, and two of these may be dispensed with. The essential parts are the statement of facts and the prayer for relief.

For the purpose of obtaining discovery the plaintiff might state in his bill at great length the evidence upon which he relied in support of his claim. This was known as the charging part of the bill. He might also ask specific questions founded upon the stating and charging parts of the bill, which he required the defendant to answer. This was known as the interrogatory part of the bill. After the appearance of the defendant, failing which a decree would be taken against him by default, he was required to answer the bill. The answer, which was required to be under oath, might set out at length any matters of defense, however numerous, relied upon by the defendant, but he was required to make discovery or give testi-

mony by answering fully and specifically the charging and interrogatory parts of the bill.

In early times other pleadings might follow the answer as at common law, but ultimately the answer came to be the last substantial pleading and was followed only by a formal plea always of the same tenor and used only to indicate that the parties were at issue.

In case it became necessary for the plaintiff to meet any of the allegations in the answer, this was accomplished by amendment. Upon the testimony taken before a master in chancery, and upon the answer, which was deemed to be not only a pleading, but in effect evidence introduced by the plaintiff, the decision and final decree of the Court of Chancery were based.

Equity pleading borrowed from the common law the use of the demurrer and the plea, with practically the same effect.

In the courts of equity of the United States, which under the Federal Constitution and statutes are distinct from the courts of common law, the same system of pleading has until recently been used as in the English Court of Chancery. It has, however, recently been thoroughly revised and modified by act of Congress. The pleading in the United States courts is, however, subject to modification by rules of court. The same system of equity pleading also obtains in those States in which the distinction between courts of equity and of law has been maintained.

Code Pleading. The supposed difficulty in satisfactorily modifying or reforming the common-law system by mere statutory revision or amendment has led in many of the United States to legislation abolishing the common-law system and creating or attempting to create a purely statutory form of pleading to be used in both law and equity actions. This step was first taken by the Legislature of New York, which adopted in 1848 the New York Code of Civil Procedure, which has served as a model for similar legislation in most of the other States adopting code procedure. A substantially statutory form of pleading and practice was also adopted in England by the Judicature Acts of 1873 and 1875. Under these codes discovery in equity actions is abolished. The pleader is allowed to plead the facts upon which he relies without formality. The pleadings are limited to two unless the defendant pleads a counterclaim, i.e., an independent action against the plaintiff, in which case the plaintiff may reply to it. The plaintiff's pleading is called a complaint, or in some States a petition, and in England a statement of claim. The defendant's pleading is called an answer, or in England a statement of defense. The defendant may demur to the plaintiff's complaint or to his reply to defendant's counterclaim, and the plaintiff may demur to defendant's answer or counterclaim, and if the demurrer is overruled, the litigant is generally allowed to plead to the merits as though no demurrer had been interposed. Formal defects can be taken advantage of only by motion before trial, and great freedom of amendment is allowed. While the codes of procedure which have in many of the States superseded the common-law system of pleading have, on the whole, done much to simplify the procedure preliminary to the trial of an issue, they have, on the other hand, introduced a new element of difficulty and in some States new and embarrassing complexities. As a code is a legisla-

tive act and therefore binding on the courts, the new system has a certain rigidity and inflexibility which has robbed the courts of the power to modify old rules to meet new conditions; while in some of the States, notoriously in New York, the minuteness with which the code regulates the details of procedure has resulted in a vast amount of litigation over merely formal matters of practice, with the result that practice under such a code has become uncertain, precarious, expensive, and subject to vexatious appeals and delays. The modern tendency is to substitute for codes of this character simple "Practice Acts," outlining the pleadings, etc., and leaving it to the courts to frame rules from time to time to govern the procedure in detail. See CIVIL LAW; CRIMINAL LAW; EQUITY; ETC.

PLEASANTVILLE. A city in Atlantic Co., N. J., 5 miles northwest of Atlantic City, on the West Jersey and Seashore and the Atlantic City railroads (Map: New Jersey, C 5). It has a city hall, many fine residences, and good schools. Pleasantville is popular as a summer resort. Pop., 1900, 2182; 1910, 4390.

PLEASANTON, plēz'on-ton, ALFRED (1824-97). An American soldier, born in Washington, D. C. He graduated at West Point in 1844 and was assigned to the dragoons, with whom he served on the frontier and in Mexico. In 1855 he was promoted captain and in February, 1862, as major in the Second Cavalry, participated in the Peninsular campaign, his command covering the retreat of the Federal army to Yorktown (Aug. 18-19, 1862). In the Maryland campaign and in the battles of South Mountain, Antietam, Fredericksburg, and Chancellorsville he rendered distinguished service. He commanded the cavalry corps of the Army of the Potomac in the Pennsylvania campaign that terminated at Gettysburg (July 1-3, 1863), where he was brevetted colonel in the regular army. The next year he defeated General Price at Marais-des-Cygnes and drove the Confederates out of Missouri. He was brevetted major general in the regular army in 1865 and in 1866 was mustered out of the volunteer service as major general. Two years later he resigned from the army and after being collector of internal revenue and commissioner became, in 1871, president of the Terre Haute and Cincinnati Railroad. In 1888 he was placed on the retired list with the rank of colonel in the regular army.

PLEASURES OF HOPE. A poem by Thomas Campbell (1799), discussing the burning questions of the time, the French Revolution, the partition of Poland, and negro slavery.

PLEASURES OF MEMORY. A didactic

poem by Samuel Rogers (1792), the only want of which, Hazlitt remarked, is that of taste and genius.

PLEASURES OF THE IMAGINATION.

A poem by Mark Akenside (1744).

PLEBEIANS (OF. *plebeien*, Fr. *plébéien*, from Lat. *plebeius*, relating to the common people, from *plebs*, common people). The common people of ancient Rome; one of the two elements of which the Roman nation consisted. (See PATRICIAN.) Their origin as a separate class is to be traced partly to natural and partly to artificial causes. The foundation of Rome, perhaps as a frontier emporium of Latin traffic (according to Mommsen's suggestion), would bring about the place a number of inferior employees, clients (see PATRON), or hangers-on, of the enterprising commercial agriculturists who laid the primitive basis of the material and moral prosperity of the city. These hangers-on, inferior in birth and descent to the patricians, were the original plebeians or nonburgesses of Rome, whose numbers were constantly increased by the subjugation of the surrounding cities and states. Thus, tradition states that, on the capture of Alba Longa, while the most distinguished citizens of that town were received among the Roman patricians, the greater part of the inhabitants, likewise transferred to Rome, were kept in submission to the *populus* or patricians of Rome—in other words, swelled the ranks of the plebeians. Similar transfers of some of the inhabitants of conquered towns are assigned to the reign of Ancus Marcius. The order of plebeians, thus gradually formed, soon exceeded the patricians in numbers. The plebeians partly inhabited Rome and partly the adjoining country. Though citizens, they were neither comprehended in the three tribes, nor in the *curiae*, nor in the patrician *gentes*, and were therefore excluded from the comitia (q.v.), the senate, and all the civil and priestly offices of the state. (See CURIA, GENS.) They could not intermarry with the patricians.

The first step (according to traditionary belief) towards breaking down the barrier between the two classes was the admission, under Tarquinius Priscus, of some of the more considerable plebeian families into the three tribes. Servius Tullius divided the part of the city and the adjacent country which was inhabited by plebeians into regions or local tribes, assigning land to those plebeians who were yet without it. The plebeian tribes, with tribunes at their head, formed an organization similar to that of the patricians. The same King further extended the rights of the plebeians by dividing the whole body of citizens, patrician and plebeian, into five classes, according to their wealth, and forming a great national assembly called the *comitia centuriata* (see COMITIA), in which the plebeians met the patricians on a footing of equality, but the patricians continued to be alone eligible to the senate, the highest magistracy, and the priestly offices. These newly acquired privileges were lost in the reign of Tarquinius Superbus, but were restored on the establishment of the Republic (509 B.C.). Soon afterward the vacancies which had occurred in the senate during the reign of the last King were filled up by the admission of the most distinguished of the plebeian *equites*, and the plebeians acquired a variety of new privileges by the laws of Valerius Publicola. (See PUBLICOLA, PUBLIUS VALEBIUS.) The encroachments on those privileges by the patri-

cians began the long-continued struggle between the two orders, through which eventually the plebeians gained access to all the civil and religious offices, and acquired for their decrees (*plebiscita*) the force of law. An important part in this development was played by the famous Licinian Rogations (q.v.). Under the Hortensian law (286 B.C.) the two hostile classes were at last amalgamated in one general body of Roman citizens with equal rights. Henceforth the term *populus* is sometimes applied to the plebeians alone, sometimes to the whole body of citizens assembled in the *comitia centuriata* or *tributa*, and *plebs* is frequently used in a loose way for the multitude or populace, in opposition to the senatorial party. For a full discussion of views, ancient and modern, of the plebeians, consult G. W. Botsford, *The Roman Assemblies*, chap. ii (New York, 1909). See OPTIMATES; PATRICIAN; ROME, *History of Rome during the Earliest or Regal Period and From the Abolition of the Decemvirate to the Defeat of the Samnites*, etc., (1) Internal History.

PLEBISCITE (Fr. *plébiscite*, from Lat. *plebiscitum*, decree of the people, from *plebis*, gen. sing. of *plebs*, people + *scitum*, decree, from *scire*, to know). Originally, a decree enacted in the Roman *comitia tributa*, or assembly of the *plebs*. The erroneous identification of the Roman *plebs* with the modern *people* led to the employment of the term "plebiscite" to designate a decree of the people obtained by an appeal to universal suffrage. In a broad sense it is synonymous with the term "referendum" (q.v.). There is, however, a tendency to confine its use to appeals to the people in respect to questions of vital constitutional change, change of sovereignty, etc. Thus Louis Napoleon was made Emperor by a plebiscite.

PLECOP'TERA (Neo-Lat. nom. pl., from Gk. *πλέκειν*, *plekein*, to twist + *πτερόν*, *pteron*, wing) An order of insects comprising the stone flies. See STONE FLY.

PLECTAMBONITES (from Gk. *πλεκτός*, *plektos*, twisted + *ἄμβων*, *ambōn*, ridge). A genus of brachiopods with shells of semicircular outline, dorsal valve concave and ventral valve convex, with long, low hinge areas, and with the shell surface marked by fine regular radiating ribs. Two species are common and well-known index fossils. *Plectambonites sericeus*, the earlier characteristic Ordovician species, has a wider, less convex form, with the ribs all of about the same size; while *Plectambonites transversalis* of the Silurian has a rounder, more convex form with several delicate ribs inserted between larger ribs. Both these species are found occupying their relative positions in the Ordovician and Silurian rocks of North America, Europe, and Asia.

PLECTOGNATHI (Neo-Lat. nom. pl., from Gk. *πλεκτός*, *plektos*, twisted + *γνάθος*, *gnathos*, jaw). A group of bony fishes having the skeleton less perfectly ossified than in osseous fishes generally. It contains many highly aberrant forms, such as the globe-fishes. The maxillary bones are coossified with the premaxillaries. The skin is usually tough or well armed with bony plates or spines. The fins are small, the spinous dorsal fin sometimes and the ventral fins always wanting. These fishes are for the most part passive creatures and depend upon their armature for protection. The order contains three suborders, viz., Sclerodermi, Ostracodermi, and Gymnodontes, and includes such forms as the

trigger fishes, trunkfishes, puffers, etc. See Plate of PLECTOGNATH FISHES.

PLECTOSPONDYLI (Neo-Lat. nom. pl., from Gk. πλεκτός, *plektós*, twisted + σπόνδυλος, *spondylos*, σφόνδυλος, *sphondylos*, backbone). A group of teleost fishes, which consists entirely of fresh-water forms and includes about eight families, to which belong the majority of all the fresh-water fishes of the world. The essential character of the order, as defined by Jordan (*Fishes of North America*, Washington, 1896), lies in the modification of the anterior vertebrae, as in the Nematognathi, but the opercular bones are all present and the skin bears scales. It contains the three well-marked suborders, Evertognathi (the carps, minnows, suckers, etc.), Heterognathi (the tropical characinids, etc.), Gymnonoti (Gymnonotidae, etc.). Cf. OSTARIO-PHYSI.

PLECTRUM (Lat., from Gk. πλῆκτρον, *plēktron*, instrument for striking, from πλῆσσειν, *plēssein*, to strike). A small instrument made of ivory, tortoise shell, metal, or wood, used for plucking the strings of certain musical instruments, like the zither and mandolin. In olden times it was simply held between the fingers, but now it is generally provided with a ring to slip over the thumb.

PLEDGE (OF. *plege*, Fr. *pleige*, OIt. *pieggio*, pledge; of uncertain etymology, perhaps ultimately from Lat. *præbere*, *præhibere*, to offer, from *præ*, before + *habere*, to have). In English and American law, the delivery of a chattel by one person to another to be held by the latter as security for the performance of an obligation, usually the payment of a debt. The common-law pledge corresponds to the *pignus* of the civil law, although it cannot certainly be said that the common-law pledge was adopted from the civil law.

A pledge is distinguishable from a mortgage in that the relation of the pledgor and pledgee is that of bailor and bailee, the legal interest of the bailee being his right to possession of the pledge with power to sell it upon nonpayment of the debt, whereas the mortgagee acquires title to the property covered by the mortgage.

Any personal property actually in existence and capable of delivery into the possession of the pledgee may be pledged. Future property (i.e., property not yet in existence, as a ship yet to be built or cloth yet to be made) cannot be pledged. An agreement, however, for the pledging of future property creates a valid equitable lien which a court of equity will enforce whenever the property comes into existence. The so-called inchoate or potential property, which the common law regarded as present legal property, as crops planted but not grown, or the wool to be grown upon sheep actually in existence, might also be pledged.

The pledgee has a right to retain possession of the pledge only until the debt is paid or obligation performed. He is bound to exercise due and reasonable care in preserving and protecting the property pledged. When the debt or obligation becomes due he is entitled to sell the pledge and apply the proceeds to the payment of the debt, turning over the surplus, if any, to the pledgor. Before selling the property he is required to give fair and reasonable notice to the pledgor, and the sale should be made in such a manner as to secure the best price for the property. The usual method is by public auction at the place where property of the class pledged is usually

sold. Notice of the sale and any particular method of sale may be waived by the pledgor. Equity also exercised its jurisdiction to foreclose a pledge by directing a judicial sale of the property pledged, thus giving to the pledgee a remedy in addition to his common-law right of sale. An unauthorized sale or misappropriation of the pledge by the pledgee amounts to a conversion of the property, for which the pledgor may bring his action in trover or replevin. But it is not a violation of the pledge for the pledgee to transfer the pledged goods to another person along with his claim against the pledgor, nor does he at common law lose his right in the pledged chattel by making an unauthorized use of it, as by selling it or repledging it for a greater amount than his claim. In many States the law of pledge is regulated by statute.

PLEH'VE, VIATCHESLAV KONSTANTINOVITCH (1846-1904). A Russian administrator. He studied law at Moscow University, entered the department of justice in 1867, became prosecuting attorney at St. Petersburg, and in 1881 director of the department of secret police in the Ministry of the Interior. He was made a Senator in 1884 and in 1894 Secretary of State for Finland. In this capacity he was a prime mover in the systematic attack begun by the government on the liberties of the Grand Duchy. (See FINLAND.) As Assistant Minister, Plehve took a very active part in lawmaking during the reign of Alexander III. After he became Minister of the Interior (1902) his repressive measures so aroused the revolutionary elements of Russia that he was assassinated in St. Petersburg, July 28, 1904. See RUSSIA.

PLEIAD, THE LOST. See LOST PLEIAD, THE; PLEIADES.

PLÉIADE, plá'yád' A name assumed by a group of scholarly French poets of the sixteenth century, seven in number, of whom Jean Daurat was master and Ronsard the best poet. The others were Belleau, Baif, Du Bellay, Jodelle, and Pontus de Thyard. Like seven Greek poets in the third century B.C. at Alexandria, they took the name *Pléiade*, from their number, on making their first declaration of principles, *La défense et illustration de la langue française*, by Du Bellay (1549). This aimed at a revival of classical studies, in the spirit of Petrarch, yet national and patriotic rather than erudite. Consult Louis Petit de Julleville, *Histoire de la langue et de la littérature française*, vol. iii (Paris, 1897), and essays by Ferdinand Brunetière in the *Revue des Deux Mondes* (ib., 1900 et seq.). See BAIF; BELLAY; BELLEAU; DAURAT; JODELLE; PONTUS DE THYARD; RONSARD.

PLEIADES (Lat., from Gk. Πλειάδες, Πληγάδες). In Greek legend the seven daughters of Atlas and Pleione, the daughter of Oceanus. According to some they committed suicide from grief, either at the death of their sisters, the Hyades (q.v.), or at the fate of their father, Atlas (q.v.); according to others, they were

5. PORCUPINE-FISH (*Diodon hystrix*) puffed out.
6. TRUNKFISH (*Lactophrys tricornis*).

companions of Artemis (Diana) and, being pursued by Orion (q.v.), were rescued from him by the gods by being translated to the sky. After their death or translation they were transformed into stars. As only six of these stars are easily visible to the naked eye, the story was told that one of them hid herself from shame that she alone had married a mortal, while her six sisters were the loves of different gods. (See LOST PLEIAD, THE, 1.) Their names are Electra, Maia, Taygete, Alcyone, Celano, Sterope, and Merope. To the Greeks the constellation was important, since with its heliacal rising in May navigation began and with its setting in November was supposed to close.

In astronomy the name designates a group of six stars on the shoulder of Taurus, the second sign of the Zodiac, forming, with the pole star and the twins, Castor and Pollux, the three angular points of a figure which is nearly an equilateral triangle. Many believe, from the uniform agreement that the Pleiades were seven in number, that the constellation at an early period contained seven stars, but that one has since disappeared—not a very uncommon occurrence. See LOST PLEIAD.

PLEIOCENE EPOCH. See PLEIOCENE EPOCH.

PLEIOSAURUS, or **PLIOSAURUS**. See PLEIOSAURUS.

PLEISTOCENE PERIOD (from Gk. *πλειστός*, *pleistos*, most, superlative of *πολύς*, *polys*, much, many + *καιρός*, *kairos*, new). The name introduced by Sir Charles Lyell to designate that period of geologic time which intervened between the end of the Tertiary and the beginning of the historic period. Within the last few years no other section of the earth's crust perhaps has received so much attention as the strata included under this name, and this is particularly true in America. The term Pleistocene is commonly used as synonymous with Quaternary, although some geologists tend to make two divisions of the Quaternary, viz., Pleistocene and recent. Other terms which are used are Post-Tertiary, Glacial period, and Ice age. One of the most marked features of the Pleistocene was its cold climate and the great development of continental glaciers which formed and spread over a large portion of the globe as a result of these climatic conditions. The faunal and floral characters of the Pleistocene were not sufficiently different from those of the Pliocene to have permitted making it a separate division of geologic time on this account, for in those regions which were not covered by the ice sheet we find that plant and animal life apparently continued on uninterruptedly from the Pliocene into the Pleistocene.

The glacial episode which marked the Pleistocene period is now fully described under GLACIAL PERIOD. Consult: T. C. Chamberlin, "Preliminary Paper on the Terminal Moraine of the Second Glacial Epoch," *United States Geological Survey, Third Annual Report* (Washington, 1883); Penck and Bruckner, *Die Alpen in Eiszeitalter* (Leipzig, 1901-09); Chamberlin and Salisbury, *Geology*, vol. iii (New York, 1907); H. L. Fairchild, "Pleistocene Geology of New York State," in *Bulletin of the Geological Society of America*, vol. xxiv (Washington, 1913). See GEOLOGY.

PLEISTOS, *plis'tōs* or *plās'tōs*. A river at Delphi (q.v.).

PLEKHANOV, *plā-kh'nof*, GEORGI VALENTINOVICH (1857-). Founder, leader, and

greatest theorist of the Russian Social Democratic party. He was born in the Government of Tambov. While a student in the Institute of Mining he took part in the famous political demonstration of 1876 near the Kazan Cathedral in St. Petersburg. Later he became a leading member of the revolutionary organization "Land and Liberty" and worked as an organizer among the laboring class of St. Petersburg and the Cossacks of the Don. Compelled to leave Russia in 1880, Plekhanov thereafter lived in Geneva and Paris, a political exile. In 1883 he organized the first group of what later became the powerful Social Democratic party of Russia. He edited a number of Socialist magazines, contributed numerous articles to the international Socialist press, and wrote some of the best-known works on Marxian Socialism, e.g., *The Monistic Interpretation of History; Anarchism and Socialism* (Am. ed. of Mrs. Eleanor M. Aveling's translation, 1908); *A Critical Study of Tchernitshevski; In the Course of Twoscore Years*. Plekhanov came to be regarded as one of the most versatile and brilliant writers of Russia. During the European War (1914 et seq.) Plekhanov stood as the leader of that faction of Russian Socialists who, instead of opposing the war, unreservedly took the side of the allies, believing that the cause of democracy was entirely dependent on their victory.

PLENER, *plā'nēr*, ERNST, BARON VON (1841-). An Austrian statesman, son of Ignaz, Knight von Plener. He was born at Eger and was educated at Vienna and Berlin. He served in the Diplomatic Corps (1865-73) and then entered the Imperial Diet, where he joined the Left and supported Andrassy's policy in the Balkans (1878). He succeeded Herbst as head of the German Liberals, both in Prague and in Vienna, and in 1888 was chosen leader of the party called United German Left. From 1893 to 1895, while Minister of Finance in Taaffe's cabinet, Plener reorganized the Austrian and Hungarian mint. In 1900, after five years at the head of the Court of Accounts, he entered the House of Lords. He became a member of the Permanent Court of Arbitration at The Hague. Plener wrote on English economic conditions, on Ferdinand Lassalle (1884), and on the Bohemian school and language question (1886).

PLENER, IGNAZ, KNIGHT VON (1810-1908). An Austrian statesman. He was born in Vienna, studied law, and entered the governmental service. In 1859 he was made Privy Councillor, a year afterward received the portfolio of Finance and revived the Bank Acts and the Ministry of Commerce before his resignation in 1865, and in 1867 entered the Liberal Centralist cabinet of Giskra as Minister of Commerce. This post he held until 1870. He was a member of the Lower House until 1873, when he was appointed to the House of Lords. Plener was an ardent defender of a personal-income tax, which he proposed in 1880. He was the father of Ernst, Baron von Plener.

PLENIPOTENTIARY. See DIPLOMATIC AGENTS; ENVOY; MINISTER.

PLEOCHROISM, *plē-ōk'rō-iz'm*. See DI CHROISM.

PLEROME (from Gk. *πλήρωμα*, *plērōma*, a filling). The central embryonic region in stems and roots. It develops into the stele, in which the vascular cylinder appears. See STEM.

PLESHCHENIEV, *plēsh-chā'yéf*, ALEXEI

(1825-93). A Russian poet, born at Kostroma and educated at the University of St. Petersburg. His first volume of poetry, published in 1845, was well received. In 1849 he was accused of conspiracy against the Czar and sentenced to be shot, but Nicholas I commuted the death sentence to banishment to Orenburg, where Pleshtcheiev enlisted in the army as a private soldier. Having distinguished himself during the Crimean War, he was pardoned in 1857 and in 1872 made his home in St. Petersburg. From this time he produced much original poetry and translated poems of Heine, Byron, and Tennyson. In 1887 he published a complete collection of his verse.

PLESIOSAURUS (Neo-Lat., from Gk. πλεσιος, *plēsios*, near + σαυρος, *sauros*, lizard). An interesting fossil marine reptile of the order Sauropterygia, found in the Liassic rocks of Europe. The order Sauropterygia comprises a number of reptiles which began as small amphibians in the Trias and culminated in the Cretaceous as larger forms fully adapted to marine life. They had short, thick, lizard-like bodies, long flexible necks, small heads, and powerful tails. The early members had elon-

40 cervical vertebrae. The teeth are not so numerous as in *Nothosaurus* and are larger, recurved, and interlocking. The pelvic and pectoral limbs are remarkably similar to each other in form, and the phalanges of both were embedded in cartilage which filled out the form of the paddle just as in the ichthyosaurs. These creatures varied from 10 to 20 feet in length, and they must have been abundant in the Liassic seas of England and Germany, where finely preserved skeletons of them have been obtained. Twenty-five species are known in the Lias of England alone. *Plesiosaurus* is a gigantic plesiosaur with a skull nearly 5 feet long and teeth 12 inches long, found in the English Upper Jurassic, and it is possibly a synthetic type between the ichthyosaurs and the plesiosaurs. American representatives of the plesiosaurs have been found in the Upper Jurassic beds of Alabama, New Jersey, Kansas, and Wyoming and have been described under the names *Cimoliosaurus*, *Megalosaurus*, *Elasmosaurus*, *Dolichorhynchops*, etc. A skeleton of Cope's *Elasmosaurus* from the Upper Cretaceous of Fort Wallace, Kans., lacking the head, measures 42 feet in length, of which the neck, with

72 vertebrae, occupies 22 feet. Some of the American examples have afforded interesting evidence of the feeding habits of these creatures. Stones of various sizes, from ¼ inch to 4 inches in diameter, were found in the position of the stomach and are supposed to have been swallowed as aids to digestion. One specimen had 125 such stones in its stomach. Plesiosaurs, as Cuvier expressed it, combine the paddles of a whale, the head of a lizard, and a long neck like the body of a serpent. They were powerful animals, swimming freely about the shallow seas

THE PLESIOSAURUS.

Outline of *Plesiosaurus dolichodeirus*, fossilized skeleton, and enlarged view of skull.

gated limbs adapted for crawling on land, which became shortened and assumed paddle-like form in the later genera, but which never so thoroughly degenerated to finlike organs as did those of the ichthyosaurs (q.v.) Two families are recognized: *Nothosauridae*, comprising small, more primitive forms, having five-toed feet with the normal number of phalanges, *Plesiosauridae*, comprising large animals with paddle-shaped limbs and the digits lengthened by an increased number of phalanges, and with the pectoral girdle enlarged to form a protective covering for the thorax. *Lariosaurus* and *Nothosaurus* from the Triassic of Europe are the important genera of the first family, and *Plesiosaurus* from the Liassic of Europe and *Cimoliosaurus* from the Cretaceous of America and New Zealand are representative of the second family.

The genus *Nothosaurus*, which attained a length of about 10 feet, had a long flattened skull and small eyes near the middle of the head. The teeth were numerous, small and regular in the posterior portion of the jaws, but large and recurved, like spreading tusks, in the front. *Plesiosaurus* had a proportionately smaller head of triangular form and a neck which in some species exceeded in length the remainder of the body and which was supported in the different species by from 25 to

of Jurassic and Cretaceous times and feeding upon the fish and smaller marine reptiles, for preying upon which their long necks and numerous spreading teeth admirably fitted them.

Williston, "A New Plesiosaur, etc.," and "An Interesting Food Habit of the Plesiosaurs," in *Transactions of the Kansas Academy of Science*, vols. xii, xiii (Topeka, 1890, 1893); id., "North American Plesiosaurs, part i," in *Field Columbian Museum, Publication 73* (Chicago, 1903); F. A. Lucas, *New Plesiosaur* (Washington, 1903).

PLESSIS, Du, du plé'sé' See RICHELIEU.

PLESSIS, plé'sé', JOSEPH OCTAVE (1763-1825). A Roman Catholic prelate of Canada, born at Montreal. He entered the priesthood in 1786, was appointed coadjutor to Monsignor Denauet, Bishop of Quebec, and succeeded to the bishopric in 1806. He obtained a royal charter for Nicolet College, which he enlarged and endowed, and founded the Catholic primary schools of Quebec. The British government did not immediately recognize him as Bishop, claiming the right of nomination to the office which the French government had formerly possessed. The Bishop successfully maintained his position, and in 1818 he was summoned to the Executive

Council of Canada by his episcopal title. Although in 1818 Quebec was made an archbishopric, the government never recognized it as such. Plessis enthusiastically supported the British crown and the Imperial relation. Consult his *Life* by Ferland (Quebec, 1864), and Kingsford, *History of Canada* (Toronto, 1888-98).

PLETHON, GREGORIUS or GEMISTUS. See GEMISTUS, GEORGE.

PLEURA (Neo-Lat., from Gk. πλεῦρά, rib, side). The name of the serous membrane investing the lung, which, after inclosing the whole organ except at its root, where the great vessels enter it, is reflected upon the inner surface of the chest. That portion of the pleura which is in contact with the surface of the lung is called the pleura pulmonalis, or visceral layer, while that which lines the interior of the chest is called the pleura costalis, or parietal layer, the two layers being normally everywhere in contact, moving upon each other freely during respiration, a lubricating fluid being secreted for this purpose. A space intervening between these two layers exists only under pathological conditions, when it may be occupied either by air or fluid, and is called the cavity of the pleura. (See PLEURISY.) Each pleura is a closed sac and quite independent of the other. The central interspace between the right and left pleurae is termed the mediastinum (q.v.) and contains all the viscera of the thorax excepting the lungs. The inner surface of each pleura is smooth, glistening, and moistened by a serous fluid; the outer surface is closely adherent to the surface of the lung, to the roots of the pulmonary vessels as they enter the lung, to the upper surface of the diaphragm, and to the walls of the chest. The lobes of the lungs are separated from one another by involutions of the visceral layer. The use of these serous sacs is much the same as that of the peritoneum (q.v.); each pleura retains the lung and to a certain extent the greater vessels in position, while it facilitates, within certain limits, the movements essential to respiration.

PLEURACANTHUS (Neo-Lat., from Gk. πλεῦρον, *pleuron*, rib + ἀκανθα, *akantha*, spine), or DIPLODUS. A fossil sharklike fish found in the Carboniferous and Permian rocks of North America, Europe, and Australia. The body was long and tapering, with a diphyccercal caudal fin. The dorsal fin extended almost the entire length of the back and was separated from the upper lobe of the caudal fin by only a slight notch. On the head was a long, posteriorly directed strong spine, hollow and armed with longitudinal rows of barbs. The pectoral and pelvic fins were large, and there were two small anal fins. Several complete skeletons have been found in the European Carboniferous rocks.

PLEURISY (Fr. *pleurésie*, from Lat. *pleuritis*, *pleuritis*, from Gk. πλεῦρις, *pleuritis*, pleurisy, from πλεῦρά, *pleura*, rib). An inflammation of the pleura (q.v.).

Pleurisy may be acute or chronic, primary or secondary, plastic (dry) or characterized by an effusion of fluid. It occurs after exposure to cold; as a secondary process in acute diseases of the lung, as pneumonia, which is always accompanied by a greater or less amount of dry pleurisy; as a result of injuries; or as an effect of rheumatism. The most frequent cause, however, is tuberculosis; recurrent attacks of pleur-

isy are almost always tuberculous in character.

In the dry or plastic form of pleurisy the affected area of the membrane becomes congested and opaque, roughened, and covered with lymph. The process may be arrested at this point, the exudate be absorbed, and complete recovery take place; or the plastic exudate may become organized and produce permanent adhesions between the two pleural layers. These adhesions are in the form of patches or bands and in proportion to their extent limit the movements of the lungs.

In pleurisy with effusion there is thrown out a varying amount of serofibrinous fluid, pale yellowish in color, or brownish at times from extravasated blood. In composition this closely resembles the serum of the blood. The effusion may be so small as to cause no symptoms and escape notice. When the amount is considerable the lung is compressed, the heart and other organs are displaced, and respiration and circulation seriously interfered with. Small quantities of fluid are readily absorbed, but large effusions may persist for months unless reduced by surgical means. In some cases the effusion is limited to the diaphragmatic portion of the pleura (diaphragmatic pleurisy); in others only the portion between the lobes of the lung is involved (interlobular pleurisy). A hemorrhagic effusion sometimes occurs during the course of certain malignant fevers and in pernicious anæmia, scurvy, and cancer.

A pleuritic exudate may become infected by pus-producing bacteria, which soon convert the fluid into a purulent material. This condition is called empyema and is a grave complication. The pleural cavity is converted into what is virtually a large abscess, which may evacuate itself by burrowing through the lung substance to a bronchial tube and being coughed up; or it may penetrate the chest wall or make its way through the diaphragm into the peritoneal cavity and set up a general peritonitis. The affection is more common and less likely to be fatal in children than in adults.

The most prominent symptoms of pleurisy are chills, fever, stitch in the side, and a dry, unproductive cough. The pain is at first severe and is exaggerated with every movement of the body, by coughing, sneezing, etc. Respiration is difficult and shallow, and the patient lies upon his back or on the healthy side. After effusion has taken place pain is less marked, and the patient lies on the affected side in order to give the healthy lung full play. In addition to these symptoms general malaise and weakness exist, accompanied by loss of appetite and a quick pulse. Empyema is marked by irregular temperature, chills, and sweats.

The physical signs of dry pleurisy are impaired motion on the affected side and a friction sound caused by the rubbing together of the inflamed surfaces. When the effusion has occurred this sound disappears, there is a loss of pulmonary resonance, and dullness or flatness on percussion over the area occupied by the effusion. The side involved is larger than the other, the intercostal spaces are obliterated or bulge. The heart may be displaced upward or to one side.

A serofibrinous pleurisy may persist for months, and the lung from the long-continued pressure may become permanently contracted, so that when the fluid is absorbed or drawn off it fails to return to its normal dimensions and to

fill the whole cavity. Adhesions may help to produce this condition.

The treatment of dry pleurisy comprises rest in bed, saline catharsis, and relief of pain by the administration of sedatives or by counter-irritation in the form of a mustard plaster or the application of the electrocautery. Strapping the chest with long strips of adhesive plaster gives comfort by limiting respiratory movements. Pleurisy with effusion requires a somewhat different plan of treatment. To favor absorption of the exudate, the diet is made light and dry, and daily concentrated doses of Epsom salts are given to promote elimination. The skin and kidneys are also kept active with diaphoretic and diuretic medicines. Mild counter-irritation with mustard or iodine is useful in the later stages. When the effusion is large and resists all ordinary methods of treatment, aspiration of the fluid or part of it is practiced. This is accomplished by puncturing the chest wall with a hollow needle attached to a suction pump. The operation is simple and not painful and is sometimes done merely to determine the nature of the exudate. The fluid is withdrawn slowly, the amount depending on the size of the effusion. In some cases a quart or more can be abstracted with safety. Frequently the withdrawal of a small amount will be followed by spontaneous absorption of the remainder. Treatment by autoserotherapy consists in withdrawing a hypodermic syringe of the exudate and injecting it immediately beneath the skin. Purulent pleurisy (empyema) is treated by making an incision into the chest wall and allowing the pus to escape, washing out the cavity and draining it. This operation dates from the time of Hippocrates and is not a serious procedure. The cavity is gradually filled by the expansion of the lung and the falling in of the chest wall. Sometimes it is necessary to remove portions of one or more ribs. Expansion of the lung is promoted by systematic breathing exercises.

PLEURISY ROOT. A milkweed. See BUTTERFLY WEED.

PLEU'ROCOC'CUS. See ALGÆ.

PLEU'RODYN'IA (Neo-Lat., from Gk. πλεῦρά, rib + ὀδύνη, *odynē*, pain). A rheumatic affection of the intercostal muscles on one side, characterized by acute pain in the side upon taking a full breath or coughing and by tenderness on pressure. The respiratory movements are restricted as much as possible on account of the pain. The disease is difficult to distinguish from intercostal neuralgia, in which disease, however, the pain is usually more limited and paroxysmal and there are tender points along the course of the nerves. It may also be mistaken for dry pleurisy (q.v.). The pain may be completely relieved by strapping the chest with strips of adhesive plaster. Mild counterirritation and stimulating liniments are very often useful. The general treatment is that of rheumatism (q.v.).

PLEU'RONEC'TIDÆ. See FLATFISH; FLOUNDER.

PLEU'ROPNEUMO'NIA (Neo-Lat., from Gk. πλευρόν, *pleuron*, side + πνευμονία, *pneumonia*, pneumonia), LUNG PLAGUE, LUNG FEVER, PERIPNEUMONIE (Fr.), LUNGENSEUCHE (Ger.). A malignant contagious disease of cattle, characterized by an inflammatory process accompanied by exudation on the pleura and in the lungs. The disease has been recognized in Eu-

rope since the close of the eighteenth century. Domestic cattle, the buffalo, and the yak are most susceptible to it. Goats, pigs, horses, and carnivora are very resistant, and man is immune. It occurs at present in Europe, Asia, Africa, and Australia. It has been eradicated from Great Britain, the last outbreaks having occurred in 1898. The disease was introduced into the United States in 1843 and was finally eradicated through the efforts of the Bureau of Animal Industry in 1892. Consult: V. T. Atkinson and others, *Special Report on Diseases of Cattle*, published by the Bureau of Animal Industry (rev. ed., Washington, 1912); Huttyra and Marek, *Special Pathology and Therapeutics of the Diseases of Domestic Animals*, vol. i (Chicago, 1912); E. W. Hoare, *A System of Veterinary Medicine*, vol. i. (ib., 1913).

PLEU'ROTOMA'RIA (Neo-Lat. nom. pl., from Gk. πλεῦρόν, *pleuron*, rib + τομάριον, *tomarion*, dim. of τόμος, *tomos*, cut, slice, from τέμνειν, *temnein*, to cut). The typical genus of Pleurotomaridæ, a family of scutibranchiate gastropods. While quite rare at the present time, this genus was abundantly represented in the seas of the Paleozoic, Mesozoic, and Cenozoic eras. Its ancestral form is apparently the genus *Raphistoma*, a small shell of the early Ordovician, with low spire and sharply angular whorls. *Pleurotomaria* itself, with elevated spire and prominent slit band, made its appearance in the Silurian, and with a great variety of forms and allied genera it attained its maximum in the seas of Mesozoic time, since when it has been gradually declining to the present time. This large genus, embracing several hundred species, is split up into a number of subgenera. One of the most important allies of *Pleurotomaria* is the Paleozoic genus *Murchisonia* (q.v.).

PLEVNA, plév'nà, or **PLEVEN**, plá'ven. A town of Bulgaria, situated on a tributary of the Danube and on the Sofia-Varna Railway, about 85 miles northeast of Sofia (Map: Balkan Peninsula, E 3). The town has a considerable trade in cattle and wine. It is connected by a branch railway, 25 miles long, with the port of Nikopol on the Danube. Pop., 1910, 23,049.

Plevna is famous for the rôle which it played in the Russo-Turkish War of 1877. Garrisoned only by a small Turkish force at the beginning of the war, the place became, after the taking of Nikopol by the Russians (July 16, 1877), the centre of operations in the western part of the theatre of war in Bulgaria. Just as the Russians were preparing to march towards Sofia Osman Pasha arrived with a part of his army at Plevna. The Turkish forces at that point now amounted to 17,000 men with 58 guns, and the Russians dared not advance leaving this unexpected enemy in their rear. On July 20, 1877, an assault by a comparatively small force of Russians was repulsed, their loss being about 2800 men. The result of the first assault revealed to the Russians the strength of the Turkish forces at Plevna, and accordingly the Russian forces were increased to about 32,000 men with 176 guns. The second attack, on July 30, led by General Krüdener, was also unsuccessful, and the Russians lost over 7000 men. The besieging army was augmented by about 35,000 Rumanians, while the Turkish forces were also increased to about 38,000 men with 70 guns. On September 7 the bombardment was resumed, and in a desperate assault

on September 11 General Skobelev captured three trenches, but was compelled to abandon them on the following day. The Russians and Rumanians lost nearly 16,000 men between September 7 and 11, and it was then decided to invest the town by a large army and compel its surrender by cutting off its supplies. These operations were successfully carried out under the direction of Totleben, and the besieged army, which had by that time been increased to about 45,000 men, soon began to suffer from lack of supplies and ammunition. Osman Pasha, finally decided to break through the Russian chain and accordingly crossed the Vid with his entire army on the night of December 9-10 and after an unsuccessful attack was thrown back towards the river, but, unable to cross the stream, surrendered unconditionally after a hard fight, in which he himself was wounded. The Russians took 40,000 prisoners and 77 guns. The total loss of the besieging army in killed and wounded was about 40,000 men.

Consult Osman Pasha, *Défense de Plevna, d'après les documents réunis par Mouzaffer Pasha et Taalat Bey* (Paris, 1889), and W. V. Herbert, *The Defense of Plevna* (London, 1896).

PLEXIMETER. See PERCUSSION.

PLEXUS. See NERVOUS SYSTEM AND BRAIN.

PLEYEL, plî'el, IGNAZ (1757-1831). An Austrian composer, born in Ruppersthal, near Vienna. He studied music under Wanhall and Haydn and made in early life an extensive tour of Italy to hear the works of the best composers. In 1789 he was made kapellmeister of the Strassburg Cathedral and there composed most of the works on which his popularity rests. In the winter of 1791-92 he was engaged as the conductor of the London Professional Concerts. He returned to Strassburg and subsequently went to Paris (1795) and after a successful career in that city as a publisher of music and pianoforte manufacturer retired to an estate which he had purchased near the capital. His compositions, consisting of 29 symphonies, numerous quartettes, concertantes, and sonatas, are full of agreeable melodies which caught the popular fancy. But the complete lack of all serious qualities caused them soon to fall into oblivion. He died on his own estate, near Paris.

PLIMER, plî'mër, ANDREW (1763-1837). An English miniature painter. He was born at Wellington (Shropshire) and was the servant and then the pupil of Richard Cosway (q.v.) whose style he imitated and whom he succeeded as a favorite miniaturist of the court. He is excellently represented by 26 works in the Morgan collection, Metropolitan Museum, New York.

His elder brother, **NATHANIEL** (1757-1822), who was born at Wellington and was for a time assistant to Henry Bone the enameler, also painted miniatures in the same style as, but inferior to, those of Andrew. The Morgan collection contains good specimens of his work also. Consult G. C. Williamson, *Andrew and Nathaniel Plimer* (London, 1903).

PLIMSOLL, plîm'sol, SAMUEL (1824-98). An English reformer, known as The Sailor's Friend. He was born and educated in Bristol. As a coal dealer in London he began to take an interest in the carrying trade and to remark upon the risks to sailors in being shipped upon overladen or unseaworthy, yet largely insured, vessels. As a member of Parliament (for Derby) and by his book *Our Seamen* (1873), he

led in the discussion of shipping abuses. In 1875 Plimsoll caused an exciting scene in the House of Commons by his violent attack upon ship-owners, some of whom were present. Eventually he secured the enactment of the Merchant Shipping Act of 1876, which remedied the sailors' grievances. His *Cattle Ships* (1890) was written to gain reform. See also **LOAD-LINE MARKS OF VESSELS**.

PLIMSOLL MARK. See **LOAD-LINE MARKS OF VESSELS**.

PLINLIMMON. See **PLYNLIMMON**.

PLINTH (Lat. *plinthus*, from Gk. *πλινθος*, *plinthos*, brick, tile, plinth). The square member at the bottom of the base of a column, also the plain projecting band forming a base of a wall. See **ORDERS OF ARCHITECTURE**.

PLINY THE ELDER, GAIUS PLINIUS SECUNDUS (23-79 A.D.). The author of the celebrated *Historia Naturalis*. He was born in the north of Italy, probably at Novum Comum (Como). Whether it was his birthplace or not, Novum Comum was certainly his family's place of residence, since he had estates in its neighborhood. While still young he was sent to Rome, where his ample means and high connections secured him the best education. At the age of 23 he entered the army and served in Germany as commander of a troop of cavalry under Lucius Pomponius Secundus, of whom in later life he wrote a memoir. He traveled over nearly all the frontier of that extensive province, visited the Chauci and the sources of the Danube, composed during the intervals of military duty his treatise *De Iaculatione Equestri*, and commenced a history (afterward completed in 20 books) of the Germanic wars. On his return to Rome in 52, he entered on the study of jurisprudence, but his pleading was unsuccessful, and accordingly he retired to his native place. There he wrote his *Studiosus*, a treatise in three books on the training of a young orator from the nursery to his entrance on public life, apparently intended to guide the education of his nephew, Pliny the Younger (q.v.); also his grammatical work, *Dubius Sermo*, in eight books. Shortly before Nero's death we find him a procurator in Spain, where in 71 he heard of his brother-in-law's decease and of his being intrusted with the guardianship of his nephew, Pliny the Younger, whom he adopted on his return to Rome, before 73. Vespasian, the reigning Emperor, whom he had known while in Germany, received him as one of his most intimate friends, and it was at this period that he completed, in 31 books, and brought down to his own time the Roman history of Aufidius Bassus. He collected an immense mass of materials, from which he compiled his great *Historia Naturalis*, published about 77. No fewer than 160 *volumina* of notes were found at his death, two years afterward. At the time of the great eruption of Vesuvius, which overwhelmed Herculaneum and Pompeii, in 79, he was stationed off Misenum in command of the Roman fleet. Eager to examine the phenomenon more closely, he landed at Stabiae, where he was suffocated by the vapors caused by the eruption. He was, as his nephew tells us, corpulent and asthmatic, and so sank the more readily. None of his attendants shared his fate. The story of his death is described in two letters of his nephew, Pliny the Younger, to Tacitus, written many years after the event (*Epistles*, vi, 16 and 20).

fill the whole cavity. Adhesions may help to produce this condition.

The treatment of dry pleurisy comprises rest in bed, saline catharsis, and relief of pain by the administration of sedatives or by counter-irritation in the form of a mustard plaster or the application of the electrocautery. Strapping the chest with long strips of adhesive plaster gives comfort by limiting respiratory movements. Pleurisy with effusion requires a somewhat different plan of treatment. To favor absorption of the exudate, the diet is made light and dry, and daily concentrated doses of Epsom salts are given to promote elimination. The skin and kidneys are also kept active with diaphoretic and diuretic medicines. Mild counter-irritation with mustard or iodine is useful in the later stages. When the effusion is large and resists all ordinary methods of treatment, aspiration of the fluid or part of it is practiced. This is accomplished by puncturing the chest wall with a hollow needle attached to a suction pump. The operation is simple and not painful and is sometimes done merely to determine the nature of the exudate. The fluid is withdrawn slowly, the amount depending on the size of the effusion. In some cases a quart or more can be abstracted with safety. Frequently the withdrawal of a small amount will be followed by spontaneous absorption of the remainder. Treatment by autoserotherapy consists in withdrawing a hypodermic syringe of the exudate and injecting it immediately beneath the skin. Purulent pleurisy (empyema) is treated by making an incision into the chest wall and allowing the pus to escape, washing out the cavity and draining it. This operation dates from the time of Hippocrates and is not a serious procedure. The cavity is gradually filled by the expansion of the lung and the falling in of the chest wall. Sometimes it is necessary to remove portions of one or more ribs. Expansion of the lung is promoted by systematic breathing exercises.

Atkinson and others, *Special Report on Diseases of Cattle*, published by the Bureau of Animal Industry (rev. ed., Washington, 1912); Huttyra and Marek, *Special Pathology and Therapeutics of the Diseases of Domestic Animals*, vol. i (Chicago, 1912); E. W. Hoare, *A System of Veterinary Medicine*, vol. i. (ib., 1913).

PLEU'ROTOMA'RIA (Neo-Lat. nom. pl., from Gk. πλευρόν, *pleuron*, rib + τομάριον, *tomarion*, dim. of τόμος, *tomos*, cut, slice, from τέμνειν, *temnein*, to cut). The typical genus of Pleurotomaridæ, a family of scutibranchiate gastropods. While quite rare at the present time, this genus was abundantly represented in the seas of the Paleozoic, Mesozoic, and Cenozoic eras. Its ancestral form is apparently the genus *Raphistoma*, a small shell of the early Ordovician, with low spire and sharply angular whorls. *Pleurotomaria* itself, with elevated spire and prominent slit band, made its appearance in the Silurian, and with a great variety of forms and allied genera it attained its maximum in the seas of Mesozoic time, since when it has been gradually declining to the present time. This large genus, embracing several hundred species, is split up into a number of subgenera. One of the most important allies of *Pleurotomaria* is the Paleozoic genus *Murchisonia* (q.v.).

PLEVNA, plév'ná, or **PLEVEN**, plá'ven. A town of Bulgaria, situated on a tributary of the Danube and on the Sofia-Varna Railway, about 85 miles northeast of Sofia (Map: Balkan Peninsula, E 3). The town has a considerable trade in cattle and wine. It is connected by a branch railway, 25 miles long, with the port of Nikopol on the Danube. Pop., 1910, 23,049.

Plevna is famous for the rôle which it played in the Russo-Turkish War of 1877. Garrisoned only by a small Turkish force at the beginning of the war, the place became, after the taking of Nikopol by the Russians (July 16, 1877), the centre of operations in the western part of the theatre of war in Bulgaria. Just as the Russians were preparing to march towards Sofia Osman Pasha arrived with a part of his army at Plevna. The Turkish forces at that point now amounted to 17,000 men with 58 guns, and the Russians dared not advance leaving this unexpected enemy in their rear. On July 20, 1877, an assault by a comparatively small force of Russians was repulsed, their loss being about 2800 men. The result of the first assault revealed to the Russians the strength of the Turkish forces at Plevna, and accordingly the Russian forces were increased to about 32,000 men with 176 guns. The second attack, on July 30, led by General Krüdener, was also unsuccessful, and the Russians lost over 7000 men. The besieging army was augmented by about 35,000 Rumanians, while the Turkish forces were also increased to about 36,000 men with 70 guns. On September 7 the bombardment was resumed, and in a desperate assault

on September 11 General Skobelev captured three trenches, but was compelled to abandon them on the following day. The Russians and Rumanians lost nearly 16,000 men between September 7 and 11, and it was then decided to invest the town by a large army and compel its surrender by cutting off its supplies. These operations were successfully carried out under the direction of Totleben, and the besieged army, which had by that time been increased to about 45,000 men, soon began to suffer from lack of supplies and ammunition. Osman Pasha finally decided to break through the Russian chain and accordingly crossed the Vid with his entire army on the night of December 9-10 and after an unsuccessful attack was thrown back towards the river, but, unable to cross the stream, surrendered unconditionally after a hard fight, in which he himself was wounded. The Russians took 40,000 prisoners and 77 guns. The total loss of the besieging army in killed and wounded was about 40,000 men.

Consult Osman Pasha, *Défense de Plevna, d'après les documents réunis par Mouzaffer Pasha et Taalat Bey* (Paris, 1889), and W. V. Herbert, *The Defense of Plevna* (London, 1896).

PLEXIMETER. See PERCUSSION.

PLEX'US. See NERVOUS SYSTEM AND BRAIN.

PLEYEL, plî'el, IGNAZ (1757-1831). An Austrian composer, born in Ruppersthal, near Vienna. He studied music under Wanhall and Haydn and made in early life an extensive tour of Italy to hear the works of the best composers. In 1789 he was made kapellmeister of the Strassburg Cathedral and there composed most of the works on which his popularity rests. In the winter of 1791-92 he was engaged as the conductor of the London Professional Concerts. He returned to Strassburg and subsequently went to Paris (1795) and after a successful career in that city as a publisher of music and pianoforte manufacturer retired to an estate which he had purchased near the capital. His compositions, consisting of 29 symphonies, numerous quartettes, concertantes, and sonatas, are full of agreeable melodies which caught the popular fancy. But the complete lack of all serious qualities caused them soon to fall into oblivion. He died on his own estate, near Paris.

PLIMER, pli'mèr, ANDREW (1763-1837). An English miniature painter. He was born at Wellington (Shropshire) and was the servant and then the pupil of Richard Cosway (q.v.) whose style he imitated and whom he succeeded as a favorite miniaturist of the court. He is excellently represented by 26 works in the Morgan collection, Metropolitan Museum, New York.

His elder brother, NATHANIEL (1757-1822), who was born at Wellington and was for a time assistant to Henry Bone the enameler, also painted miniatures in the same style as, but inferior to, those of Andrew. The Morgan collection contains good specimens of his work also. Consult G. C. Williamson, *Andrew and Nathaniel Plimer* (London, 1903).

PLIMSOLL, plim'sol, SAMUEL (1824-98). An English reformer, known as The Sailor's Friend. He was born and educated in Bristol. As a coal dealer in London he began to take an interest in the carrying trade and to remark upon the risks to sailors in being shipped upon overladen or unseaworthy, yet largely insured, vessels. As a member of Parliament (for Derby) and by his book *Our Seamen* (1873), he

led in the discussion of shipping abuses. In 1875 Plimsoll caused an exciting scene in the House of Commons by his violent attack upon ship-owners, some of whom were present. Eventually he secured the enactment of the Merchant Shipping Act of 1876, which remedied the sailors' grievances. His *Cattle Ships* (1890) was written to gain reform. See also LOAD-LINE MARKS OF VESSELS.

PLIMSOLL MARK. See LOAD-LINE MARKS OF VESSELS.

PLINLIMMON. See PLYNLIMMON.

PLINTH (Lat. *plinthus*, from Gk. *πλινθος*, *plinthos*, brick, tile, plinth). The square member at the bottom of the base of a column, also the plain projecting band forming a base of a wall. See ORDERS OF ARCHITECTURE.

PLIN'Y THE ELDER, GAIUS PLINIUS SECUNDUS (23-79 A.D.). The author of the celebrated *Historia Naturalis*. He was born in the north of Italy, probably at Novum Comum (Como). Whether it was his birthplace or not, Novum Comum was certainly his family's place of residence, since he had estates in its neighborhood. While still young he was sent to Rome, where his ample means and high connections secured him the best education. At the age of 23 he entered the army and served in Germany as commander of a troop of cavalry under Lucius Pomponius Secundus, of whom in later life he wrote a memoir. He traveled over nearly all the frontier of that extensive province, visited the Chauci and the sources of the Danube, composed during the intervals of military duty his treatise *De laoculatione Equestri*, and commenced a history (afterward completed in 20 books) of the Germanic wars. On his return to Rome in 52, he entered on the study of jurisprudence; but his pleading was unsuccessful, and accordingly he retired to his native place. There he wrote his *Studiosus*, a treatise in three books on the training of a young orator from the nursery to his entrance on public life, apparently intended to guide the education of his nephew, Pliny the Younger (q.v.); also his grammatical work, *Dubius Sermo*, in eight books. Shortly before Nero's death we find him a procurator in Spain, where in 71 he heard of his brother-in-law's decease and of his being intrusted with the guardianship of his nephew, Pliny the Younger, whom he adopted on his return to Rome, before 73. Vespasian, the reigning Emperor, whom he had known while in Germany, received him as one of his most intimate friends, and it was at this period that he completed, in 31 books, and brought down to his own time the Roman history of Aufidius Bassus. He collected an immense mass of materials, from which he compiled his great *Historia Naturalis*, published about 77. No fewer than 160 *volumina* of notes were found at his death, two years afterward. At the time of the great eruption of Vesuvius, which overwhelmed Herculaneum and Pompeii, in 79, he was stationed off Misenum in command of the Roman fleet. Eager to examine the phenomenon more closely, he landed at Stabiae, where he was suffocated by the vapors caused by the eruption. He was, as his nephew tells us, corpulent and asthmatic, and so sank the more readily. None of his attendants shared his fate. The story of his death is described in two letters of his nephew, Pliny the Younger, to Tacitus, written many years after the event (*Epistles*, vi, 16 and 20).

Of all his works, only his *Historia Naturalis* has come down to us. It comprehends discussions of astronomy, ethnography, anthropology, meteorology, geography, mineralogy, zoölogy, botany, of everything, in short, which is a natural or nonartificial product. Moreover, the work is interspersed with digressions on such subjects as human institutions and inventions and the history of fine arts. It is divided into 37 books, the first of them being a dedicatory epistle to Titus, with a table of contents of the remaining books, and embraces, as we are told in the preface, 20,000 matters of importance, extracted from about 2000 volumes. Its scientific merit is not great. There is little attempt at philosophical arrangement; the observations are nearly all taken at second hand and show small discrimination in separating the true from the false or the probable from the marvelous. His meaning is often obscure, owing to his lack of personal acquaintance with the matters of which he treats and his failure to grasp the true sense of the authors whom he cites or translates. But the work is a great monument of industry and research and most valuable as supplying us with details on a great variety of subjects about which we have no other means of information. The best critical editions of the text are those of Sillig (8 vols., Gotha, 1851-58), Jan (Leipzig, 1875-80), and Mayhoff (a recension of Jan, Leipzig, 1875-1908; vols. i and ii have appeared in a third edition, 1906, 1909). There is an old English translation by Holland (London, 1601), and a more recent one, in Bohn's Library, by Bostock and Riley (London, 1855-57). Pliny's chapters on the history of art are edited, with commentary, by Jex-Blake and Sellers (London, 1896). Consult: G. A. Simcox, *A History of Latin Literature*, vol. ii (New York, 1883); W. S. Teuffel, *Geschichte der römischen Literatur*, vol. ii (6th ed., Leipzig, 1910); Martin Schanz, *Geschichte der römischen Literatur*, vol. ii, part ii (3d ed., Munich, 1913).

PLINY THE YOUNGER (GAIUS PLINIUS CÆCILIUS SECUNDUS). A nephew of Pliny the Elder (q.v.) and son of Gaius Cæcilius. He was born at Novum Comum (Como) 62 A.D. He was still young when he lost his father and was adopted by his uncle, under whose care and that of his mother, Plinia, and his tutor, Virginus Rufus, his education was conducted. Passionately devoted to literature, he wrote a Greek tragedy at the age of 13. He studied eloquence under Quintilian (q.v.) and became so famous for his literary accomplishments that he acquired the reputation of being one of the most learned men of his age. His oratorical powers were also considerable: in his nineteenth year he began to speak in the Forum, and his services as an advocate before the court of the centumviri (q.v.) and the Roman Senate were in frequent request. He held numerous official appointments; served, while a young man, as *tribunus militum* in Syria, where he listened to the teaching of Euphrates the Stoic and Artemidorus; was afterward *quæstor Cæsaris*; was prætor about 93 and consul in 100, when he wrote his *Panegyricus*, a eulogy of the Emperor Trajan. He was appointed, in 103, proprætor of the Provincia Pontica or Bithynia, an office which he vacated in less than two years; and he also discharged the function of curator of the banks and channel of the Tiber. He was twice married, his second wife being Calpurnia, grand-

daughter of Calpurnius Fabatus. Our knowledge of Pliny the Younger is mainly derived from his letters or *Epistolæ*, of which there are 10 books. He collected them himself and probably wrote many of them with a view to publication. They hold a high place in epistolary literature and give us many interesting glimpses into the life of their author and his contemporaries. Pliny himself appears in them to considerable advantage, as a genial and philanthropic man, enamored of literary studies and fond of improving his estates by architectural adornment. His ample fortune was liberally bestowed, and his slaves always found in him an indulgent master. He never enjoyed robust health; but of the time or cause of his death we know nothing. Of his letters, one of the most interesting is the one to the Emperor Trajan (x, 97), written while Pliny was Governor of Bithynia and asking for instruction in regard to the policy to be pursued against the Christians; this is one of the earliest notices of the Christians in Roman writers. The best editions of the text of Pliny's *Panegyricus* and *Epistolæ* together are those of Schæfer (Leipzig, 1805), Kell (ib., 1892), Müller (ib., 1913), and E. T. Merrill (ib., 1914). Annotated editions of *Selected Letters* were published by Church and Brodribb (London, 1871) and E. T. Merrill (ib., 1903). Of English translations, there are the *Panegyricus* by Bond (London, 1724) and the *Epistolæ* by Melmoth (ib., 1746; 10th ed., 1805), Lord Orrery (ib., 1752), and J. D. Lewis (ib., 1879). An excellent sketch of Pliny's life by Rendall is printed in Mayor's edition of book iii of the *Epistolæ* (ib., 1880) and in Merrill's edition of *Selected Letters*. Consult also: Church and Brodribb, *Pliny's Letters* (Philadelphia, 1875); G. A. Simcox, *A History of Latin Literature*, vol. ii (New York, 1883); W. S. Teuffel, *Geschichte der römischen Literatur*, vol. ii (6th ed., Leipzig, 1910); Martin Schanz, *Geschichte der römischen Literatur*, vol. ii, part ii (3d ed., Munich, 1913).

PLIOCENE EPOCH (from Gk. *πλειων*, *pleiōn*, more, comparative of *πολύς*, *polys*, much, many + *καινός*, *kainos*, new). The name given by Sir Charles Lyell to the uppermost division of the Tertiary system. Pliocene rocks are not extensively developed in America, but in Europe they are of great importance. Along the Atlantic coast of the United States isolated areas have been found from Virginia southward to Florida; and similar patches occur on the Pacific coast, the Merced series of the San Francisco peninsula having a thickness of nearly 6000 feet. In the interior there are a number of Pliocene basins in which fresh-water strata were deposited. The Goodnight and Blanco stages of Texas and similar strata in Kansas, Oklahoma, and Oregon were laid down in fresh-water lakes. The Pliocene of Europe comprises extensive deposits in Spain, France, Italy, Sicily, and Greece, and smaller areas in Belgium, northern France, and England. The life of the Pliocene epoch is quite modern in character, although many species of both plants and animals are no longer existent. The rhinoceros, horse, llama, sloth, mastodon, and peccary inhabited North America at that time, while the European fauna included many forms which resemble those living at present in Africa. The most interesting fossil of Pliocene age is that of a manlike ape, *Pithecanthropus erectus*, from the

island of Java, supposed by some anthropologists to be an ancestral type of man. See MAN, SCIENCE OF, *Ancient Types*; also TERTIARY SYSTEM.

PLIOSAURUS (Neo-Lat., from Eng. *pliocene* + Gk. *σαῦρος*, *sauros*, lizard). A gigantic Plesiosaurus with large head and short neck. See PLESIOSAURUS.

PLIQUE-À-JOUR. See ENAMEL.

PLOCK, plòtsk. A government occupying the northwestern part of Russian Poland, consisting of seven districts and bounded by Prussia on the north. Area, 4200 square miles (Map: Russia, B 4). The surface is slightly elevated towards the north and slopes towards the valley of the Vistula. Its chief rivers are the Vistula, which forms the southern and western boundaries of the government, and the Narev. The soil is well adapted for agriculture, which is the chief occupation within this government. Rye, potatoes, oats, and beets are the principal agricultural products, the last named being raised for the beet-sugar mills in the governments of Plock and Warsaw. Stock breeding is also important. The manufacturing industries are confined mostly to the production of sugar, flour, and trimmed lumber. The government was occupied by the Germans during the European War which began in 1914. (See WAR IN EUROPE.) Pop., 1913, 753,700.

PLOCK. One of the oldest cities of Russian Poland and capital of the Government of Plock, picturesquely situated on the right bank of the Vistula, about 60 miles west-northwest of Warsaw (Map: Russia, A 4). It is a pretty town with a fine public garden, a town hall, a cathedral founded in the twelfth century, two Gymnasias, a seminary for teachers, a theatre, and a number of libraries. The manufacturing industries are of little importance, but there is a considerable trade in grain, which is carried by the Vistula to Germany. Pop., 1910, 30,771, mostly Jewish. Plock is mentioned in connection with the introduction of Christianity into Poland in the tenth century. It was the capital of the mediæval Principality of Masovia. Plock was captured by the Germans in 1915. See WAR IN EUROPE.

PLOESTI, plò-yèsht'yí. A town of Rumania. See PLOYESHTI.

PLOMBIÈRES, plòñ'byâr'. A fashionable watering place in the Department of Vosges, France, 13 miles south of Epinal (Map: France, N., M 5). It is picturesquely situated in a deep valley on the Augronne and is celebrated for a number of mineral and thermal springs, known since the time of the Romans. The springs are about 30 in number and have an alkaline reaction with a trace of arsenic. The waters are used both internally and externally for rheumatism, digestive maladies, and nervous disorders. The place was embellished by Stanislas Leszczynski in the eighteenth century and by Napoleon III in the nineteenth. There are sumptuous public and private bathhouses, a hospital founded by Stanislas, two large hotels, a casino, a park, and promenades. Pop., 1901, 1830; 1911, 1786. At Plombières in July, 1858, occurred the secret meeting between Napoleon III and Cavour which led to the conclusion of an alliance between France and Sardinia against Austria. See CAVOUR; ITALY.

PLÖNNIES, plë'ní-es, LUISE VON (1803-72). A German lyric and religious poet, born (Leis-

ler) at Darmstadt. Her sketches of travel in Belgium, published in 1847, and her translation of Vondel's *Lucifer* (1845) won her election to the Brussels Royal Academy. Her lyric ability is best shown by her translations, *Britannia* (1843), *Englische Lyriker des 19. Jahrhunderts* (1863), though some of her original works have merit, such as *Gedichte* (1844); a sonnet sequence, *Abälard und Heloise* (1849); *Die sieben Raben* (1862; 3d ed., 1866). Of her religious poems the best known are: *Lilien auf dem Felde* (1864); *Maria Magdalena* (1870), a drama; *David* (1873). Consult *Allgemeine deutsche Biographie*, vol. xxvi (Leipzig, 1888).

PLÖNNIES, WILHELM VON (1828-71). A German writer, son of Luise von Plönnies. He was born in Darmstadt, entered the Hessian infantry at 16, fought in the campaign of 1848-49 in Baden, and resigned in 1861. In belles-lettres he made himself known by a version of *Kudrun* (1853), by the poems *Immortellen des Schlachtfeldes* (1870) and *Schwannennieder* (1871), and by a satirical novel, *Leben, Wirken und Ende des Generals Leberecht vom Knopf* (1869; 2d ed., 1877; written under the pseudonym Ludwig Siegrist). His works on firearms are valuable. They include: *Neue Studien über die gezeugene Feuerwaffe der Infanterie* (1861-64); *Das Zündnadelgewehr* (1865); *Hinterladungsgewehre* (1867); *Die deutsche Gewehrfrage* (1871), with Weygandt.

PLON-PLON, plòñ'-plòñ'. A name given to Prince Napoleon, son of Jerome Bonaparte, in allusion to his cowardice in the Crimean War. The word is a corruption of *Plomb-plomb* (lead).

PLO'SIVES. See MUTES.

PLOTIA GENS. See PLAUTIA GENS.

PLOTINUS (Lat., from Gk. Πλωτίνος, *Plōtinos*) (c.205-270 A.D.). The most original and important philosopher of the Neoplatonic school. He was born, of Roman parents, at Lycopolis in Egypt; but he was so utterly indifferent to things human, "being ashamed almost to live in a body," that he never would divulge even his parentage. He would never allow his birthday to be celebrated, although he gave feasts on those of Socrates and Plato; nor would he permit a painter or sculptor to perpetuate his features or, as he called it, to produce the image of an image, the body being to him only a faint image of existence. His body was altogether contemptible in his eyes; he would see no physician in his illness, and was very sparing in the use of food, refraining from meat, often even from bread. Strangely enough, his desire for the study of philosophy did not arise before his twenty-eighth year, when he repaired to Alexandria, and there, after having sat at the feet of the great masters for some time without feeling satisfied with their teachings, he at last became acquainted with Ammonius Saccas, and in him found the desired teacher. (See AMMONIUS.) For 10 years he zealously attended his lectures, and, although he had agreed, with two fellow students, never to make known aught of Ammonius' teachings to the world, he yet became the chief representative and author of that school, less as a pupil than as an independent thinker who, taking his stand upon its theorems, developed them to their full extent. In 242 he joined Gordianus' expedition to Persia, in order to devote himself to the philosophy of India and Persia; but, when the Emperor was

murdered in Mesopotamia, he had to repair hurriedly to Antioch, whence, in 244, he went to Rome. His lectures there were attended by crowds not only of eager youths, but of men and women of the highest circles. Not only Platonic wisdom in Neoplatonic garb, but asceticism and the charm of a purely contemplative life, were the themes on which he, in ever-new variations and with an extraordinary depth and brilliancy, held forth; and such was the impression his earnestness made upon his hearers that several of them really gave up their fortunes to the poor, set their slaves free, and devoted themselves to a life of study and ascetic piety. Dying parents intrusted their children and money to him, well knowing that a more honest guardian and one more anxious for his charges could not be found. It is hardly surprising to find that his contemporaries coupled with his rare virtues the gift of working miracles. At the age of 60 he thought of founding an aristocratic and communistic commonwealth on the model of Plato's Republic, and obtained from the Emperor Gallienus a grant of two cities in Campania as a site for his Platonopolis; but courtiers prevented the fulfillment of this promise. Plotinus died at Puteoli (now Pozzuoli).

Plotinus' system was based chiefly on Plato's theory of ideas; but, while Plato assumed the ideas to be the link between the visible and the invisible, or between the supreme Deity and the world, Plotinus held the doctrine of emanation, i.e., the constant transmission of powers from the absolute to the creation, through several agencies, the first of which is pure intelligence, whence flows the soul of the world, whence, again, come the souls of men and animals, and finally matter itself. Men thus belong to two worlds, that of the senses and that of pure intelligence. It depends upon ourselves, however, to which of the two worlds we direct our thoughts most and finally belong. The ordinary virtues, such as justice, moderation, valor, and the like, are only the beginning and very first preparation to our elevation into the spiritual realm, purification, or the exercise of purifying virtues, is a further step, to which we attain partly through mathematics and dialectic; and the abandonment of all earthly interests for those of intellectual meditation is the nearest approach to the goal. The higher our soul rises in this sphere of intellect, the deeper it sinks into the ocean of the good and the pure, until at last its union with God is complete. Plotinus' philosophy, which, as it were, tried to combine all the systems of Anaxagoras, Parmenides, the Pythagoreans, Plato, and Socrates, and the Stoa into one, was the last and boldest attempt of the ancient Greek world to explain the mystery of the creation and of existence. Its influence upon modern philosophy is remarkable. From Spinoza to Schelling the reminiscences of Plotinus, irrespective of the drift of particular parts of individual systems, recur constantly. See NEOPLATONISM.

Plotinus' works include 54 treatises, in Greek, arranged in six enneads, or groups of nine books each, an arrangement due, probably, to Porphyry (q.v.), who edited Plotinus' writings. They were well-nigh forgotten, when Marsilius Ficinus first published a Latin paraphrase of them (Florence, 1492), which was followed by the *editio princeps* of the original (Basel, 1580, 1615). The first critical edi-

tion, however, is due to Creuzer (3 vols., Oxford, 1835). Others are those of Dübner (Paris, 1855), Kirchhoff (1856), Müller (with translation, 1878), Volkman (Leipzig, 1883-84). Parts of his works were translated into German by Engelhard (1820), Müller (1878), O. Kiefer (selections, Jena, 1905); into English by Taylor (1794, 1817; this was re-edited, with introduction and bibliography, in 1895, by G. R. S. Mead); into French by Bouillet (1861). Consult: C. H. Kirchner, *Die Philosophie des Plotinus* (Halle, 1854); Emil Brenning, *Die Lehre vom Schönen bei Plotin* (Göttingen, 1864); A. Richter, *Neuplatonische Studien* (Halle, 1864-67); Hugo von Kleist, *Plotinische Studien* (Heidelberg, 1883); Athanasios Pisyros, *Die Tugendlehre des Plotin* (Leipzig, 1895); A. Drews, *Plotin und der Untergang der antiken Weltanschauung* (Jena, 1907); W. C. Wright, *A Short History of Greek Literature* (New York, 1907); K. S. Guthrie, *The Philosophy of Plotinus* (London, 1910); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part ii (5th ed., Munich, 1913).

PLOTZ, plōts, HARRY (1890-). An American bacteriologist. He was born in Paterson, N. J., and graduated from the College of Physicians and Surgeons (Columbia University) in 1913. While pathologist at Mount Sinai Hospital, New York, he discovered in 1914 the bacillus of typhus and demonstrated the identity of typhus with Brill's disease, a theory first brought forward in 1902. In 1915 he announced a protective vaccine against typhus and in July of the same year Dr. Plotz and Dr. George Baehr were sent by Mount Sinai Hospital to Servia, where an epidemic was raging, with a complete outfit for vaccination against typhus. See TYPHUS.

PLOUG, plōøg, PARMO CARL (1813-94). A Danish poet and politician, born in Kolding. As editor of *Fædrelandet* (the Fatherland) from 1841 to 1881 he used his pen to uphold the national Scandinavian spirit. He was a member of the constitutional convention in 1848-49, and from 1854 to 1857 of the Folkething. His popular student songs were published under a pen name as *Poul Rytters Viser og Vers* (1847), and in 1861 his complete poems, *Samlede Digte* (5th ed., 1876), appeared. His later volumes of verse, erotic and patriotic, were *Nyere Sange og Digte* (1869), *Nye Digte* (1883), and the posthumous *Efterladte Digte* (1895). His son, Hother Ploug, edited a standard edition of his father's poems in two volumes (1901).

PLOVER, plūv'ēr (OF. *plovier*, Fr. *pluvier*, from ML. *pluvarius*, plover, from Lat. *pluvia*, rain, from *pluere*, to rain; connected with Gk. *πλεῖν*, *plein*, Skt. *plu*, *pru*, to swim, and ultimately with Lith. *plusti*, Lett *pludet*, AS. *fleoetan*, OHG. *fliozzan*, Ger. *flessen*, to flow; so called because the bird appears during the rainy season). A limicoline bird of the subfamily Charadriinae, of the large shore-bird family Charadriidae, having a bill somewhat like that of a pigeon, with a convex horny terminal portion, behind which it is contracted; the legs not very long, naked a little above the tarsal joint; the wings rather long and pointed, the first quill feather the longest; and usually only three toes. The species are about 60 in number, found in every quarter of the globe, and many are migratory and of very wide range. As a rule they frequent low moist grounds, where

PLOVERS

1

2

3

4

5

6

1. WILSON'S PLOVER (*Ochthodromus wilsonius*).
2. KILLDEER (*Oxyechus vociferus*).
3. AMERICAN GOLDEN PLOVER (*Charadrius dominicus*).

4. BLACK-BELLIED PLOVER (*Squatarola squatarola*).
5. LAPWING (*Vanellus vanellus*).
6. EGYPTIAN SPUR-WINGED PLOVER (*Hoplopterus spinosus*).

they congregate in flocks, and feed on worms, insects, and the like. Some of them are table delicacies. The golden or yellow plover (*Charadrius dominicus*) is 11 inches long, blackish, speckled with yellow at the tips and edges of the feathers;

BEAK OF THE GOLDEN PLOVER.

the throat, breast, and belly black in summer, whitish in winter. It is a bird of passage in the United States, breeds in the far north, and winters in Central and South America,

going even as far south as Patagonia. In the eastern United States it is more common in autumn than in spring. It makes an artless nest, little more than a slight depression of the ground, and lays four eggs. The parent birds show great anxiety for the protection of their young, and use various stratagems to divert the attention of an enemy. The genus *Agialitis* comprises the ringed plovers, much smaller birds, characterized by their dark neck bands. The ringed plover (*Agialitis hiaticula*) is found in Greenland and the Arctic regions of America, but is most abundant in the northerly parts of the Old World. It occurs at almost all seasons on sandy and shingly flats, from which the sea retires at ebb tide. It is often to be seen also on the banks of large rivers, lakes, and ponds. It is grayish brown above, whitish beneath, with a collar of white round the neck, and below it a black, in winter a brown, collar; the head marked with black and white; a white bar on the wing.

In the United States six species exist, all closely resembling the ringed plover, of which the semipalmated or ringneck (*Agialitis semipalmata*) is the American analogue. The largest and best known is the killdeer (q.v.) The piping plover (*Agialitis meloda*) is found along the Atlantic coast and is notable for the musical quality of its notes. The snowy plover (*Agialitis mvosa*) is a handsome species found in the southwestern United States. All the ring plovers lay their three or four eggs in a depression in the ground; the eggs vary in color from creamy white to olive drab, heavily marked with blackish brown. In the western United States occurs the mountain plover (q.v.), which differs from the others in the absence of any black belt or markings on the neutral surface. The beetlehead or black-bellied plover (*Squatarola squatarola*) is a nearly cosmopolitan form, recognizable in any plumage by the small hind toe and the rounded scales on the front of the tarsus. It is nearly a foot long, and in full plumage is a very handsome bird, black and white contrasting in its plumage to make it notable. It breeds in the Arctic regions and winters in the tropics. The bird known to American sportsmen as the upland plover is not a plover at all, but a sandpiper (*Bartramia longicauda*).

Several remarkable birds of this group belong in South America, Africa, and Australasia. One of these is the Egyptian spur-winged plover (q.v.; see also CROCODILE BIRD). Another is the strange crook-billed plover of New Zealand. (See WRYBILL.) Closely allied to them are the European and Asiatic lapwings and the South American *teru-teru* (q.v.) of the widespread genus *Vanellus*. Consult: G. E. Shelley, *Birds*

of Egypt (London, 1872); Dresser, *Birds of Europe* (ib., 1881); Walsingham and Galloway, *Shooting* (2 vols., ib., 1886); H. Seebohm, *Birds of Asia* (ib., 1888); Buller, *Birds of New Zealand* (2d ed., ib., 1888); Sharpe and Hudson, *Argentine Ornithology* (ib., 1888); W. B. Lefringwell, *Shooting on Upland, Marsh, and Stream* (Chicago, 1890); D. G. Elliot, *Shore Birds of North America* (New York, 1895). See Plate of EGGS OF WATER AND GAME BIRDS; and Plate of PLOVERS.

FLOW, PLOWING (AS. *plōh*, OHG. *pfluoh*, Ger. *Pflug*, plow, connected with Longobardic *plovum* and possibly with Gk. *γλωχίν*, *glōchin*, projecting point). In all countries where agriculture is in an advanced state the first agricultural operation in order and importance is plowing to break up the soil and invert the upper stratum. Such an operation also buries and destroys weeds; leaves the surface clean, unencumbered, and in a condition favorable for weathering; increases the storage capacity of the soil for water, but also assists percolation and thus aids in drying and warming the soil.

The plow, though simple in appearance, is the product of slow evolution and much mechanical

FIG. 1. PRIMITIVE PLOW.

skill. The plow in primitive form probably antedates history. The Old Testament mentions plows shod with iron or bronze, but except in western Europe and America little progress has been made in improving the implement since the time of Herodotus. One of the earliest types of plows is shown in Fig. 1; a type of the ordinary modern plow in its simple form in Fig. 2. As will be seen, the modern

FIG. 2. AMERICAN PLOW.

plow consists of several parts—a beam, by which the plow is drawn, which may be of wood or metal; two handles, usually wood, fastened to the beam with braces, for guiding. To the end of the beam a clevis or bridle is attached for convenience in hitching the team and regulating the depth and width of furrow, and near the outer end a small adjustable wheel (frequently omitted) for assisting in steadying the plow and regulating the depth of the furrow. Behind this is a coulter for cutting the furrow slice at the side. This coulter takes various forms—a miniature plow or jointer, a stout iron knife, or a revolving disk with sharp edge. Back of the coulter is the plow proper, consisting of a forged-steel, malleable-iron, or cast-iron frog to which is attached a pointed share for cutting the furrow slice at the bottom, a moldboard for turning the furrow slice, and the landside opposite the moldboard, which presses against the side of the furrows and helps

to steady the plow. In the best plows these latter parts are usually made of soft-centre steel or chilled iron.

The first patent for a plow is said to have been obtained by Joseph Foljamb in 1730, and Jethro Tull about this time invented a plow designed especially to pulverize the soil thoroughly, an idea embodied in modern plows of the best type. The Dutch were the first to improve the primitive Roman plow. Figure 3

FIG. 3. EARLY DUTCH PLOW.

shows the Rotherham plow used in Holland at the beginning of the eighteenth century and afterward introduced into England, which contained most of the fundamental ideas of the modern plow.

In attempts to improve the plow the moldboard, which raises and turns the furrow slice and which appeared in the plows of the Netherlands during the seventeenth century, has probably received more attention than any other single part. Thomas Jefferson, who published his views in 1798, and James Small, in 1802, were among the first to attempt to establish the proper lines of the moldboard upon a mathematical basis. As determined by the shape of the moldboard, ordinary plows are of two main types: (1) sod plows, with long sloping moldboard, which turn a narrow, flat furrow without pulverizing the furrow slice, but which bury vegetation, sod, manure, etc., effectually; and (2) the stubble plows, with short, steep, overhanging moldboard, which break up the furrow slice and pulverize the soil. English plows are generally of the first type. The modern American plow is generally of the second type, although plows of the first type are made and used to a considerable extent for special purposes in America, as, e.g., in breaking tough sod land. The first American patent for a plow was granted to Charles Newbold in 1797 for a cast-iron plow, but the modern type of American plow may be said to date from Sept. 1, 1819, when Jethro Wood, of Scipio, N. Y., took out a patent for an improved cast-iron plow having the moldboard (of pulverizing type), share, and landside cast in three separate pieces so that they could be replaced by new parts when worn. Wood gave the American plow its proper shape. The next important improvement on his ideas was the substitution of steel for cast-iron parts, as was done by John Lane in 1836 and John Deere in 1837, resulting in the modern steel plow.

Anderson found that 55 per cent of the draft of the plow is consumed in cutting the furrow slice, 12 per cent in turning it, and 33 per cent by the sole and landside. Since such a small percentage of the energy required in plowing is consumed by the moldboard, it would seem to be economy to make this of such form that it will disintegrate the furrow slice as completely as possible. Such breaking of the furrow slice makes it easier for the tillage implements following the plow to fine the soil thoroughly without disturbing the buried sod and vegetation.

A further important advantage of the work of such plows is the increased opportunity afforded to the soil for weathering.

There are numerous kinds of plows used for special purposes, such as trench or ditching plows, which are made on the same principle as the common plow, but larger and stronger, so as to bring up a portion of the subsoil to the surface; or subsoil plows, which have no moldboard and merely stir and break up the subsoil, thus facilitating drainage. There are also double moldboard plows, which are merely common plows with a moldboard on each side, employed for water furrowing, etc.; the hillside or swivel plow, which is provided with a reversible moldboard, so that the team may walk in the opposite direction, but always place the furrow against the one previously turned. Another special form of plow is the double-furrow or gang plow, which consists of an iron frame, usually mounted on a wheel or wheels, carrying two or more plows, one set a little to the rear of the other, and at the distance it is desired the width of the furrow should be. The sulky plow (Fig. 4), which may also be a gang

FIG. 4. SULKY PLOW

plow, has also come into extensive use, the object of such plows being to lessen friction and reduce the labor of the plowman. The draft of such plows, however, was found by Sanborn to be not materially less than that of the ordinary swing plow. The first patent for sulky plows in America was granted to H. Brown in 1844, but practical plows of this type were not made until about 1864, and the manufacture of such plows is still in a state of evolution, although numerous forms are found on the market. The disk plow (Fig. 5), which is a comparatively recent invention, has attracted wide attention on

FIG. 5. DISK PLOW

account of its effective work under certain conditions. The principal feature of this plow in its more perfect form is a tempered steel disk (usually two disks) 25 to 30 inches in diameter, set at an angle to the furrow and to the sur-

face so as to turn and pulverize the soil. It is kept from clogging and assisted in pulverizing the soil by an adjustable scraper. The disk is carried by a steel framework mounted on wheels and provided with a seat for the driver and levers for control and adjustment of the plow.

The idea of the use of engines and machinery for plowing seems to have originated with David Ramsey and Thomas Wildgosse in 1818, but the history of practical motor plowing dates from

and durable engine of sufficient traction and adapted to different kinds of land. On the Western wheat ranches there has, according to Taylor, been "developed a special form of engine for plowing, harvesting, and similar work. These engines have assumed a tricycle form, the weight of the boiler and engine resting on two very high, wide tread wheels with a third wheel of caster type in front for easy steering. A high-pressure, forced-draft boiler is used, and

FIG. 6. DOUBLE-ENGINE OR DIRECT METHOD OF STEAM PLOWING.

the invention of Fowler, assisted by Smith, in 1854. The inventions along this line have included plans for engines traveling over the surface of the ground, drawing plows or other cultivating implements along with them; engines working on tramways and drawing implements after them; engines moving along opposite headlands and working implements between them by means of wire ropes and stationary engines driving implements also by means of wire ropes. The steam plows used most widely in England belong to two classes—double-engine and single-engine, or direct and roundabout (Figs. 6 and 7). Gang plows carried on wheels are usually employed in these systems, the plows being in two series facing in opposite directions and so

small, high-speed engines, developing from 40 to 80 horse power. Such engines draw from 12 to 18 twelve-inch plows, and turn over 25 to 40 acres per day." But in many places these have been displaced by the gasoline tractor. A system using electricity on the trolley plan has been introduced in Germany with some success. It is claimed for the better systems of motor plowing that they are cheaper and more efficient than the ordinary methods. This may be true where horses and feed are expensive, fuel cheap, and lands level and otherwise well suited to these systems; but that it is universally true remains to be demonstrated.

The time and manner of plowing will be determined by the special object to be attained.

FIG. 7. SINGLE-ENGINE OR ROUNDABOUT METHOD OF STEAM PLOWING.

arranged that when one series is in operation the other is elevated above the soil. The motor plows used in America are of the gang class, drawn by a traction motor, as shown in Fig. 8. Attention of American inventors has been directed mainly towards developing a cheap, light,

In soils more or less impervious to water it is advisable to plow to different depths at different seasons of the year in order to prevent the formation of hardpan, which occurs when plowing to the same depth for several seasons, due to the pressure of the plow and the trampling

of the teams. If the soil is very pervious it is sometimes desirable to promote this formation of hardpan to arrest a too rapid percolation of water. Plowing promotes aëration of the soil and nitrification (q.v.) and otherwise improves the physical and chemical condition of soils, resulting in increased productiveness. A deep-tilled layer of soil is desirable, but this should be brought about gradually, since the plowing should not be so deep as to bring up raw subsoil. Plowing to a greater depth than 6 or 7 inches is rarely desirable. The time and manner of plowing will be determined by climatic conditions, character of soil, and kind of crop to be raised. Sod may be plowed wetter than stubble land. In midsummer and fall deep plowing is desirable; in early spring rather shallow plowing is usually best. Manures and similar material should not be turned under deeply in

his case, and the matter was dropped. After the accession of Elizabeth he failed of political preferment because he was a Roman Catholic; but he retained his reputation as the greatest lawyer of his day and as a fearless and upright public man. During his early career he was twice a reader of the Middle Temple, and he was its treasurer at the time when its present fine library was begun. (See INNS OF COURT.) He frequently appeared in court against the government as counsel for those of his own faith, Bishop Bonner being one. His reputation rests chiefly on a series of reports of trials, *Les Comentaires, etc.* (1571; Eng. trans., 1792, 1816), written in law French. Extending over the entire period of his connection with the bar, they are valuable as a clear and accurate record of the precedents of the author's time. Besides these he wrote *Les Quæres del Monsieur Plowden*

FIG. 8. AMERICAN METHOD OF STEAM PLOWING.

the spring. If there is danger of too rapid evaporation, surface tillage should follow very closely after plowing. Fall-plowed land should generally be left rough. Unless the soil has very good natural drainage the plowed land should have open furrows from 10 to 15 paces apart.

PLOWLAND. See CARUCATE.

PLOWMAN'S TALE, THE. A rhyming ballad by an unknown poet, written about 1395, printed as a Canterbury tale in Thynne's second edition of Chaucer, 1542. It is a denunciation of Roman Catholicism in the story of a dispute heard by a plowman between a griffin (Rome) and a pelican (Lollardism).

PLow MONDAY, or ROCK MONDAY. The name of the Monday after Twelfth Day, or the close of the Christmas holidays, when the work of the plow is supposed to start again. In England in some places the day is devoted to rustic sports. A plow is dragged from door to door by plowmen, who ask for contributions.

PLOYESHTI, plô-yesh'tê, or **PLOESTI** (Rum. *Ploesti*). A town of Rumania, capital of the Department of Prahova, 38 miles north of Bucharest (Map: Balkan Peninsula, F 2). It is advantageously situated in a petroleum-bearing district and is rapidly increasing in commercial importance. Its educational in-

stitutions include a lycée, a school of arts and crafts, an institution for teachers, and a commercial school. It is an important military and railway centre. Pop., 1900, 42,687; 1912, 56,594.

PLÜCKER, plük'ër, JULIUS (1801-68). A German mathematician and physicist, born at Elberfeld. After holding positions at the universities of Halle and Berlin he became professor of mathematics at Bonn (1836). Plücker produced works of very great importance in the field of analytic geometry. In his *Analytisch-geometrische Entwicklungen* (2 vols., 1828, 1831) he developed the dual relation between modern analysis and pure geometry. The *System der analytischen Geometrie* (1835) deals extensively with the classification of cubic curves. His *Theorie der algebraischen Curven* (1839) contains the famous six equations relating to the singularities of higher plane curves. (See CURVE.) This was followed by his *System der Geometrie des Raumes in neuer analytischer Behandlungsweise* (1846; 3d ed., 1852). From 1847 onward Plücker devoted his attention to physics and became professor of this science at Bonn. He devoted his attention especially to the magnetic properties of gases and fluids, to the electric luminosity of rarefied space, and to the phenomena of the spectroscope and the Geissler tubes. In 1865 Plücker once more turned his attention to mathematics and invented what is now called line geometry. He died before he had finished the publication of a work on this subject containing his theory of complexes and congruences (see CONGRUENCE), but it was completed by his pupil and assistant, Klein, under the title *Neue Geometrie des Raumes gegründet auf die Betrachtung der geraden Linie als Raumelement* (1868-69). His scientific memoirs were published in the *Proceedings* of the Royal Society of Science at Göttingen. He was also a contributor to the *Philosophical Transactions* of the Royal Society. Among the papers contributed are: "On a New Geometry of Space" (1865, vol. clv); "On the Magnetic Induction of Crystals" (1858, vol. cxlviii); "On the Spectra of Ignited Gases" (1865, vol. clv). Consult Clebsch, *Zum Gedächtnis an J. Plucker* (Göttingen, 1872), and Dronke, *Julius Plucker* (Bonn, 1871). His *Gesammelte Abhandlungen* have been published in two parts by the Royal Society of Göttingen (Leipzig, 1895-96).

PLUM (AS. *plāme*, *plȳme*, OHG. *pfūmo*, *pfūma*, Ger. *Pflaume*, from Lat. *prunum*, plum, *pruna*, plum tree, from Gk. *πρῶνον*, *prounon*, *πρῶνον*, *proumnon*, plum, *πρῶνη*, *prounē*, *πρῶμη*, *proumnē*, plum tree). Small trees or shrubs belonging to the genus *Prunus* and extensively cultivated as orchard fruits in temperate regions. The fruit is distinguished from the peach, its near relative, by its smooth skin and unwrinkled stone. It is larger than the cherry and is further distinguished from it by the bloom covering it. There are three main groups of widely cultivated plums: (1) domestica or European plum (*Prunus domestica*), (2) Japanese plum (*Prunus triflora*), and (3) native American plums, cultivated only in America, having been derived largely by selection during the closing years of the nineteenth century from numerous native species, the most important of which are: Americana types, from *Prunus americana*, commonly found from the Atlantic west to the Rocky Mountains and south to the Gulf; the Wild Goose or Hortulana types, from

Prunus hortulana; and Chickasaw types, from *Prunus angustifolia*. The domestica varieties were the first plums cultivated in the United States. They thrive in the regions north of Pennsylvania and west to the Great Lakes and on the Pacific slope, where the American prune industry has reached its greatest development. The European plum (*Prunus domestica*) is native to eastern Europe and west-central Asia. Another plum native to southern Europe and extensively grown as a stock is the myrobalan or cherry plum (*Prunus cerasifera*). There are but very few cultivated varieties of this species. The Japanese plum (*Prunus triflora*) is native to China. In commercial importance it stands next to the European plums. Many varieties ripen much earlier than the European plums. The fruit is very firm and stands shipment well, and the trees are not so susceptible

WILD PLUM (*Prunus americana*).

to black knot and the curculio. They were first introduced in America about 1870, and have rapidly become popular in the United States, where they can be grown much farther south than the European plums. There are many varieties of most of the above species of plums now in cultivation, and in addition a large number of named hybrids. The South Dakota Experiment Station has originated some promising hardy plums for the northern prairie region by crossing the native Dakota plums and sand cherries with European and Japanese plums.

Plums true to variety are propagated usually by budding the seedlings in August or September. Whip grafting is used to some extent and has proved especially valuable in working plums on peach roots. They may also be top-worked in the same manner as apples. Plums, as a rule, do best in a deep, rather heavy soil with an open subsoil. The domesticas prefer a heavy clay soil, while the Japanese varieties and some of the hybrids may be grown on light sandy soils. Most varieties may be set in the orchard when one year from the bud or graft, but with the European plums two-year-old trees are preferred. Waugh and other investigators have shown that for all practical purposes native American plums and Japanese varieties are sterile to their own pollen and will not produce fruit unless the trees are mixed in the orchard with other varieties. Plums are set in the orchard about 15 feet apart each way. A few varieties require 20 feet each way. Pruning the plum is confined largely to the formation of the head during the first two or three years' growth in the orchard and afterward to removing dead and crossed branches. The plum orchard in America is usually plowed in early spring and kept well cultivated until the middle

of summer, when it is seeded to some cover crop. In some of the Northwestern States mulching with straw, marsh hay, etc., has been found preferable to cultivation. A moderate amount of barnyard manure applied every second year has been found beneficial in the plum orchard, and wood ashes on soils deficient in potash and lime. Most varieties of plums tend regularly to overbear, and thinning has been found necessary to secure the finest fruit, especially with the American varieties. The plums are left to stand 2 or 3 inches apart. They are marketed as soon as they become well colored. In the United States the eight-pound grape basket makes one of the most satisfactory packages.

Plum Diseases. Plums and cherries are often attacked by the same fungi. Leaf blight or shot hole is due to the presence of one or both of two fungi, *Cylindrosporium padi* and *Septoria cerasina*, in the leaves, the symptoms being alike on both plum and cherry. Circular purplish spots $\frac{1}{8}$ inch in diameter appear; later the tissues become brown and break out from the leaves, leaving holes as though made with shot. In severe cases the leaves turn yellow and the trees are defoliated. This disease can be prevented by spraying the trees with Bordeaux mixture at intervals of two weeks from the time the leaves appear until July. Another disease to which the plum and cherry are subject is the black knot or plum knot, due to *Plowrightia morbosa*, which appears as a serious pest only upon sour cherries and upon plums. When mature the black knots are rough wart-like excrescences upon the branches. At first they are yellowish in color, but soon become darker, the surfaces having a velvet-like appearance. This soon disappears and the knots grow still darker, in winter becoming black. The infested branches should be cut and burned, and where knots are on large limbs or upon the tree trunks they may be cut out or painted with kerosene. After careful pruning the trees may be sprayed during the growing season with any good fungicide (q.v.) to prevent the germination of any spores that may find lodgment. A disease peculiar to the plum is that known as plum pockets, due to attacks of *Eoascus pruni*. The fruit is infected soon after blossoming and begins to swell until it becomes an inch or two in length. At first the pocket is light in color, but finally becomes dark brown or black, and the fruit falls to the ground. It is usually hollow and bladdery in appearance, hence the name. The walls of the fruit are thickened, but it contains no stone or pit. The leaves and stems also are attacked, the affected parts assuming swollen, distorted shapes. This disease can be controlled to some extent by thorough use of fungicides. Applications should be made before the buds have opened and again just after the flowers have fallen. The plum and peach are attacked by the fungus *Cladosporium carpophilum*, which causes the well-known scab. Brown rot is also common on plums, often causing their rapid decay at ripening. Both diseases can be controlled by proper spraying. Consult: Edward Bartrum, *Book of Pears and Plums* (New York, 1903); W. P. Hedrick, *Plums of New York* (Albany, 1911); F. A. Waugh, *Plums and Plum Culture* (New York, 1912); W. F. Wight, "Varieties of Plums Derived from Native American Species," in *United States Department of Agriculture, Bulletin No. 172* (Washington, 1915); also publications of State

agricultural experiment stations. See ASCOMYCETES; and Colored Plate of DRUPES. See also PLUM INSECTS.

PLUM, BEACH (*Prunus maritima*). A species of plum growing upon the Atlantic coast from New Brunswick to Virginia and appearing again in Michigan along the lake. As a class beach plums are of little value for their fruit, only a single named variety being listed. For ornament, however, the group has greater merit, as the blossoms are rather large and showy and the fruits are of high color when ripe.

PLUM, DATE. See PERSIMMON.

PLUMAGE. See BIRD; FEATHER.

PLUMBAGO. See GRAPHITE.

PLUMBING (from *plumb*, from OF. *plomb*, *plom*, Fr. *plomb*, from Lat. *plumbum*, lead). In its broadest sense, the pipes and fixtures within houses or other buildings used to supply water, gas, and heat, including in the latter steam and hot water, and also the pipes used to remove liquid wastes from buildings; or the mechanic art of providing the pipes and fixtures named. A more restricted and more common use of the term includes only the water supply and house drainage systems, leaving gas fitting and steam and hot-water fitting in two separate classes. (See GAS, ILLUMINATING AND FUEL; HEATING AND VENTILATION.) The early plumber worked in lead, providing pipe systems for water supply, applying sheet lead for roof coverings, and setting window glass. Later lead pipe was adopted for other purposes, notably for gas services and for removing household wastes. Hence the name "plumber" originally applied to a worker in lead. Still later lead was largely replaced by other metals. (See PIPE.) Today the plumber and the gas, steam, and hot-water fitter employ lead, wrought-iron, brass, copper, and the various kinds of plated pipe, including nickel-plated goods. Vitrified clay or sewer pipe is not used in good plumbing, at least not in buildings, but vitrified pipe is

KITCHEN BOILER AND CONNECTIONS.

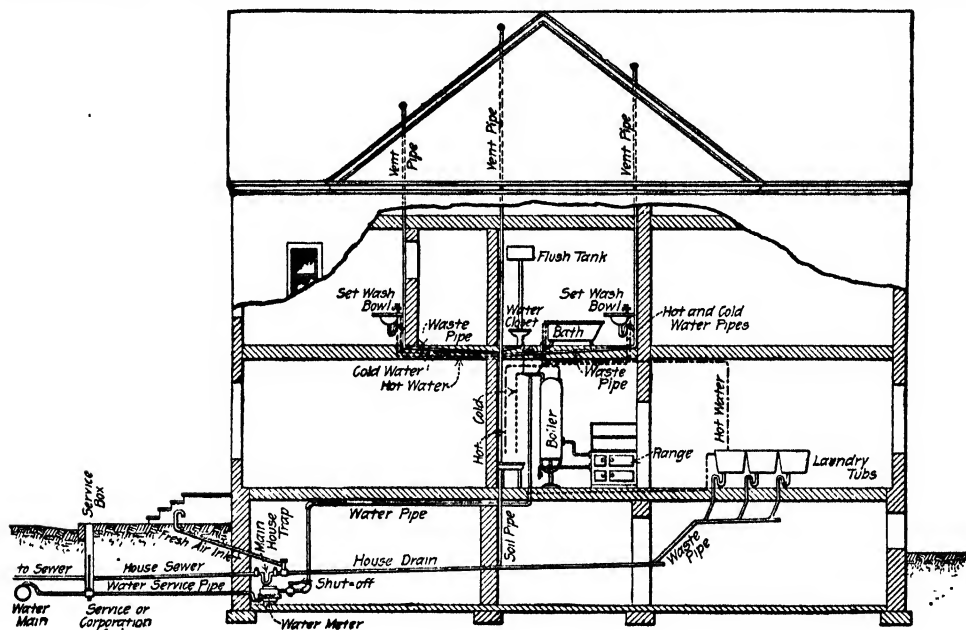

almost wholly used to connect the house and street sewerage systems.

Water Supply. The pipe leading from the street main to the building is called the house connection or service pipe and is frequently laid,

at least as far as the curb or sidewalk line, by the water department. The service pipe, and the water-pipe system within the house as well, may be of lead or wrought iron, or, if the building be large, the main piping may be of cast iron. In highly finished, expensive work brass or nickel-plated pipe is sometimes used, and copper may be employed for hot-water piping. As some waters attack and decompose lead and give rise to lead poisoning, the materials for service and house piping should be chosen with care. (See **SANITARY LAWS; WATER WORKS.**) A valve at the sidewalk enables the water department to turn on or shut off the water to the consumer at will, and another valve, just inside the cellar wall, permits the householder to control the house supply from that point also. The water meter, if employed,

water going to the tanks when full; also with overflow or waste pipes.

Fixtures. The various faucets, sinks, and other similar appliances connected with a plumbing system are called fixtures. Faucets, cocks, or valves are provided at each place where water is to be drawn. (See **VALVES.**) It is important that these should be of high grade, to prevent leakage. Sinks are provided in the kitchen, the butler's pantry, and, in large houses and semipublic and public buildings, in various other places. Most commonly they are of iron and have hot and cold water. Laundry tubs are placed in a separate room or in the kitchen, and consist of two or more rectangular compartments, with the front side sloping, provided with hot and cold water and composed of soapstone, artificial stone, cement, iron, earthenware, porce-

WATER SUPPLY AND DRAINAGE OF A DWELLING.

is generally placed just inside the latter shut-off valve. Except in the smaller and cheaper houses the water piping is mostly in duplicate, one set of pipes being for hot and one for cold water. The water is heated by circulating through a pipe or a water back at the rear of the kitchen range, from which it goes for storage to the kitchen or range boiler. Where large supplies of hot water are used a separate heater fired either by coal or gas may be employed, and in the latter case the burner is regulated automatically. These hot-water boilers are made of wrought iron, steel, or copper, with riveted joints, and should be tested to withstand a high pressure. When the water supply is liable to be inadequate at times, or when the direct pressure is too heavy for safety to the plumbing, a tank is provided in the upper part of the building, and in a skyscraper there may be several sets of these tanks at different elevations. Tanks for the fire lines are often required for large buildings. Great care is necessary to secure and maintain water-tightness. Tanks must be provided with automatic valves to insure a constant supply therein and to prevent

lain, or other material, with or without hinged wooden covers. The chief essential in the material for laundry tubs is lack of porosity, on which account wood, with its high absorbing quality, is unsuitable. Set washbowls are provided in bathrooms and lavatories, in the private rooms of hotels, and sometimes in the sleeping rooms of private dwellings. At one time they were most commonly of marble, but cast iron and steel, both painted and enameled, and porcelain are now more generally employed. Bathtubs, once generally constructed of polished sheet copper, formed on wood, or of solid copper, are now made of enameled cast iron and of porcelain. Shower baths, sitz baths, and foot baths are for the special purposes indicated and are made of different designs and materials. Water-closets, so called because matter deposited into them is flushed out by a discharge of water, are most commonly of glazed earthenware, although in cheap work cast iron is sometimes used. The old-fashioned pan water-closet was one of the most unsanitary of all plumbing fixtures. It consisted of a metal pan, hinged so as to drop downward and discharge its contents into the

pipe with which it was connected. The valve and plunger closets, operated as indicated by their names, were but little better, and are also out of date. Most of the approved forms of water-closets now in use depend for their action upon the sudden discharge of a few gallons

TYPES OF WATER-CLOSETS.

of water, generally from a tank located above the closet. The discharge is usually effected by pulling a hanging chain attached to a lever and valve. In the case of closets in public places the tanks may discharge automatically. Recently, however, attachments have been introduced for flushing water-closets without the use of a tank, the water supply being controlled by a valve operated by a short lever, near the closet seat. In either case the water thus liberated displaces the water previously standing in the bowl or hopper of the closet or else sets it in motion by siphonic action, carrying the wastes with it. By this means the closet is kept fairly clean, particularly the most exposed portions, and the parts not thoroughly clean are always wet. There is an almost endless variety of closets. Some of the most approved patterns are shown in section by the accompanying illustrations. Water-closet flush tanks are generally of wood, lined with copper and provided with a float valve, a water supply, and a flush pipe. Urinals are provided in public places and consist of either bowls or vertical slabs of nonporous material inclosed in stalls and provided with flushing water. Latrines are a series of water-closet stalls connected with a long trough or common flushing chamber be-

low. They are employed chiefly for barracks and institutions. Sill or hose cocks are faucets or valves, with a provision for attaching hose, provided at convenient points for sprinkling lawns and washing sidewalks.

House Sewerage or Drainage. This includes everything required to remove fouled water from the house to the sewer. The pipes from each separate fixture are known as waste pipes; they run to one or more soil pipes, the soil pipe being the vertical run of pipe from the highest fixture to the cellar; the house drain extends from the foot of the soil to a point near the cellar wall, and the house sewer from the latter point to the street sewer. Waste pipes, particularly short runs from washbowls and minor fixtures, may be of lead, but, generally speaking, cast or wrought iron is preferable for important wastes. All soil pipes and the house drain also should be of cast iron. Heavy pipe should be used throughout. The house sewer should be of extra heavy iron through and a short distance beyond the foundation, after which vitrified clay is permissible. All soil and waste pipes should be carried up through the roof. Traps are placed below each fixture and a main trap is generally set just inside the cellar wall. All main traps should have fresh-air inlets or a pipe extending from the inner end of the trap to the outer air. This provides for a circulation of air through the house drain and soil pipe. An increasing number of sanitary engineers favor the omission of the main trap, thus insuring a thorough ventilation of the house and street sewerage system through the numerous soil pipes at one extremity and the street manholes at the other. The object of a trap is to prevent foul air from the house or street sewerage system from entering the house. To this end the simplest and most common practice is to form a water seal by making a bend in the pipe shaped like the letter U or like the letter S, the former being called a U trap and the latter an S trap. Bell traps are formed by inverting a bell or cup over the upper and open end of a pipe, the whole being so adjusted that the edge of the pipe is always submerged. Grease traps may be described as enlargements on waste pipes to retain grease instead of allowing it to pass

TYPES OF TRAPS.

on and clog the sewers. They are most commonly used on the water or drain pipes of large kitchens. Vent pipes were formerly run from the back of each trap to a connection with the

outer air, to give a back air pressure on the trap and lessen the danger from siphonage. Obviously such a pipe from every trap greatly complicates a plumbing system, and trap vents are now omitted on much of the best work in the United States. Regarding the omission of both main traps and trap vents it should be said that there is little need for them on well designed and built house and street sewerage systems, provided that nonsiphoning traps are employed and the disposition of fixtures does not necessitate long branch wastes without the aeration obtained from the vent pipe.

General Considerations. Simplicity, accessibility, a high grade of material throughout, heavy weights for pipes, and good workmanship are the essentials of plumbing. To secure these plumbing should be designed only by the most competent sanitary engineers and should be under the rigid supervision of efficient municipal inspectors. All plans for plumbing should be filed with the plumbing inspector or health department. The hydraulic-pressure test should be applied when the rough plumbing has been completed, and the smoke or peppermint test when the fixtures are set.

Bibliography. C. V. Chapin, *Municipal Sanitation in the United States* (Providence, 1901), valuable on account of its extracts and summaries based on plumbing ordinances, J. J. Lawler, *Modern Plumbing, Steam and Hot Water Heating* (15th ed., New York, 1909); W. P. Gerhard, *The Sanitation, Water Supply, and Sewage Disposal of County Houses* (ib., 1909); id., *House Drainage and Sanitary Plumbing* (3th ed., ib., 1909); id., *Water Supply, Sewerage, and Plumbing of Modern City Buildings* (ib., 1910); R. M. Starbuck, *Standard Practical Plumbing* (ib., 1910); William Hutton, *Country Plumbing Practice* (ib., 1914); W. P. Gerhard, *Sanitary Engineering of Buildings* (ib., 1915); Davis and Dye, *Complete and Practical Treatise on Plumbing and Sanitation* (2 vols., ib., 1915); R. M. Starbuck, *Modern Plumbing Illustrated* (3d ed., ib., 1915). See GAS; HEATING AND VENTILATION; SEWERAGE; WATER WORKS.

PLUMB LINE, DEFLECTION OF THE. See DEFLECTION OF THE PLUMB LINE

PLUM CURCULIO. A weevil (*Conotrachelus nenuphar*) especially injurious to the plum. See PLUM INSECTS

PLUMED KNIGHT. A nickname of James G. Blaine, first given by Col. Robert G. Ingersoll in 1876 in nominating Blaine for the chairmanship of the Republican convention.

PLUME MOTH. A moth of the family Pterophoridae, a group of wide distribution and probably numerous in species, but the insects are very small and very delicate and are seldom collected. The wings are usually divided after the fashion of a hand into fingers, so as to form feathers. The hind wings are more completely divided than the front, which sometimes are not parted more than once or twice. There is much variety in the habits of the larvæ and pupæ; some are covered with hair and live exposed upon leaves, and some have hairy pupæ, while in some cases there is a slight cocoon. Some larvæ are curiously armed and protectively colored. About 65 species are known in the United States. One of the commonest forms (*Oxyptilus periscelidauctylus*) is yellowish brown in color. The larvæ hatch in the spring and feed upon the leaves of the grape, of which they fasten several together. The caterpillars

live either singly or in companies of two or three in such habitations, changing to pupæ early in June.

The species of the family Orneodidae are also included in the term "plume moth," since the wings are divided as in the Pterophoridae, but much more greatly divided, each wing being split into six plumes. Only one species (*Orneodes hexadactyla*) occurs in the United States, and it is found also in Europe and Canada.

PLUMIER, plu'myá', CHARLES (1646-1704). A French botanist, born at Marseilles. He studied botany under the celebrated Joseph de Tournefort (q.v.), and in 1689 visited the West Indies. On his return he published *Description des plantes de l'Amérique*, with numerous plates (1693). At the King's request he twice again visited North America, in 1693 and 1695. In 1703 appeared his *Nova Plantarum Americanarum Genera*. When about to sail the fourth time for America, in order to investigate the subject of Peruvian bark (cinchona), he died at Cadiz. A work that is still often consulted is his treatise on the ferns of America, which appeared in the year after his death. It contains 172 engraved plates. He wrote extensively in miscellaneous publications on the plants, birds, and fishes of America. A genus of South American plants, *Plumeria* (Apocynaceæ), several species of which are cultivated for the fragrance of their flowers, was named by Tournefort in his honor. Consult Albrecht von Haller, *Bibliotheca Botanica* (Göttingen, 1771).

PLUM INSECTS. The most notable of the insects which damage the plum in the United States is the plum curculio (*Conotrachelus nenuphar*), a species which for many years has destroyed almost the entire crop over large sections of the country. It is a small, rough, grayish or blackish beetle, about one-fifth of an inch long, with a black, shining hump on the middle of each wing case. The female lays her eggs in the young fruit shortly after it is formed, making with her long snout a small cut through the skin, running in the snout to a depth of about one-sixteenth of an inch. In this cavity the egg is placed. She then cuts a crescent-shaped slit through the skin in front of the hole so as to undermine the egg and leave it in a flap, the object being apparently to cause the piece around the egg to wilt and thus to prevent the growing fruit from crushing the egg. The larva is a white,

PLUM CURCULIO (*Conotrachelus nenuphar*) AND ITS WORK. a, adult beetle, b, a young plum attacked by the larva; c, cherry affected by the larva.

footless grub which feeds upon the flesh of the fruit, for the most part about the stone. It reaches full growth in from three to five weeks. The fruit meantime has become diseased and has fallen prematurely to the ground. The larva

leaves the fallen fruit, enters the ground to a depth of from 4 to 6 inches, and transforms to pupa in an earthen cell, issuing in from three to six weeks in the adult condition. The insect is single-brooded and hibernates as an adult. The beetles emerge from hibernation when the trees are about to blossom, feed for some time by puncturing the twigs and buds, and lay their eggs in the fruit soon after it is formed. The best remedies consist in spraying the trees with an arsenical mixture during the feeding time of the beetles, and afterward in jarring them, causing the beetles to fall from the branches, when they are caught in cloth receptacles and destroyed. This jarring method is carried on with great success in some of the largest orchards in the country.

Very few other insects are specifically connected with the plum. The larva of one of the sphinx moths (*Sphinx drupiferarum*) feeds upon the foliage, and a number of other species are found more or less abundantly eating the leaves. None of them, however, are ever sufficiently abundant to cause marked damage. As mentioned under PEACH INSECTS, the peach-tree borer sometimes attacks the trunks of plum trees. Another weevil occasionally damages the fruit, and this species, the plum gouger (*Cocotorus scutellaris*), is especially abundant in parts of the West. It appears in the spring, about the same time as the plum curculio, but, instead of cutting a crescent-shaped flap, bores a round hole in the fruit like the puncture of a pin. The larva, instead of feeding around the stone of the fruit, works its way through the soft shell of the stone and feeds upon the kernel.

Consult Slingerland and Crosby, *Manual of Fruit Insects* (New York, 1914).

PLUMMER, ALFRED (1841-). An English biblical scholar, born at Heworth, Durham. He was educated at Exeter College, Oxford, was a fellow of Trinity (1865-75) and tutor and dean (1867-74), and then was master of University College, Durham, until 1902, being subwarden of the University of Durham in 1896-1902. He translated several of Döllinger's works and was one of the translators of Von Ranke's *History of England*. Plummer was one of the editors of the valuable *International Critical Commentary* on the Bible and he wrote much for it and other similar series. He published also: *A Handbook on the Church and the Early Fathers* (1887); three volumes of *Lectures on English Church History* (1904-06); *The Church of England in the Eighteenth Century* (1910); *The Churches in Britain before A.D. 1000* (1911); *The Continental Reformation in Germany, France, and Switzerland from the Birth of Luther to the Death of Calvin* (1912); *The Humanity of Christ and Other Sermons* (1913).

PLUMMER, MARY WRIGHT (1856-1916). An American librarian. She was born at Richmond, Ind., was a special student at Wellesley (1881-82) and at Columbia (1887-88), served as librarian of the Pratt Institute Free Library, Brooklyn (1896-1904), and as director of the institute's Library School (1896-1911), and thereafter was principal of the Library School of the New York Public Library. In 1915 the American Library Association elected her its president. Besides contributions to periodicals Miss Plummer published: *Hints to Small Libraries* (1894; 4th ed., 1911); *Verses* (1896); *Contemporary Spain* (1899); *Roy and Ray in Mexico* (1907); *Roy and Ray in Canada*

(1908); *Stories from the Chronicle of the Old* (1910).

PLUM POCKET. See ASCOMYCETES; **PLUM. PLUMPTRE**, plūm'trē, EDWARD HAYES (1821-91). An English clergyman, theologian, and author. He was born in London, Aug. 6, 1821, was educated at University College, Oxford, and became fellow of Brasenose in 1844. Subsequently he was chaplain of King's College, London (1847-68); professor of pastoral theology there (1853-63) and professor of New Testament exegesis (1864-81); assistant preacher at Lincoln's Inn (1851-58) and prebendary of St. Paul's (1863-81). In 1866 he also served as Boyle lecturer, in 1869 became rector of Pluckley, and in 1873 vicar of Bickley. He was one of the Old Testament company of revisers appointed by Convocation (1869-74). He became dean of Wells in 1881 and it was there he died, Feb. 1, 1891. Besides volumes of verses, *Lazarus and Other Poems* (1864), *Master and Scholar* (1866), *Things New and Old* (1884), he published poetical translations of Sophocles (1865), *Æschylus* (1868), and of Dante's *Divina commedia* and *Canzoniere* (1886-87), the latter particularly helpful in its notes. In prose, besides commentaries and contributions to various dictionaries, and periodicals, he wrote: *Christ and Christendom* (1867); *Biblical Studies* (1870); *Movements in Religious Thought: Romanism, Protestantism, and Agnosticism* (1879); *The Spirits in Prison* (1884); *Life and Letters of Bishop Ken* (1888); *Wells Cathedral and its Deans* (1888).

PLUNK'ET, WILLIAM CONYNNGHAM, first BARON (1765-1854). A British advocate, orator, and statesman, born at Enniskillen, Ireland. He graduated at Dublin University in 1784, studied law in London, was called to the bar in Ireland (1787), and was made king's counsel 10 years later. He sat in the Irish Parliament for the last two years of its existence (1799-1800), and was denounced as a renegade when he became Solicitor-General (1803). He was appointed Attorney-General for Ireland in Pitt's government (1805); was elected in 1807, and sat again in 1812-22, in the British House of Commons, where he made his mark as the most eloquent Protestant pleader for Catholic emancipation. Once more Attorney-General for Ireland (1822), he became a peer and Chief Justice (1827) and was Lord Chancellor of Ireland from 1830 until 1841, when he retired. Consult the memoir by F. Douglass How (New York, 1901).

PLUNKETT, SIR HORACE CURZON (1854-). An Irish statesman, son of the sixteenth Baron Dunsany. He was educated at Eton and at University College, Oxford. He lived on a ranch in Montana from 1879 to 1889. Soon after his return to Ireland he founded (1894) the Irish Agricultural Organization Society and formed (1895) the Recess Committee, whose report (1896) on agricultural needs and suggested legislation he drafted. In 1892-1900 he was a Unionist member of Parliament, in 1897 became a member of the Irish Privy Council, and in 1899-1907 was vice president of the department of agriculture and technical instruction in Ireland, which had grown from the recommendations of his Recess Committee. He held this office even after he lost his seat in Parliament, and when the Liberals came into power in 1906 was retained by Bryce until Nationalist opposition to him grew too strong. He then re-

signed and government support to the valuable work done by his Irish Agricultural Organization Society (the I. A. O. S.) was withdrawn. He had been knighted in 1903. In 1911 at the All Ireland Model Election of the Proportional Representation Society of Ireland he was returned with John Redmond and Sir Edward Carson at the head of the poll. Early in 1914 he visited Ulster and attempted to bring about peace, and in February suggested that after a term of years a part of Ulster might vote whether it would secede from Home Rule Ireland. Later in the year he came out for Home Rule. He wrote several pamphlets on agricultural, especially dairy, coöperation in Ireland, *Ireland in the New Century* (1904, rev., 1905; in Italian, 1914), which particularly irritated the Nationalists, *Noblesse Oblige: An Irish Rendering* (1908), *The Rural Life Problem in the United States* (1910); *A Better Way: An Appeal to Ulster not to Desert Ireland* (1914). Consult Sydney Brooks, "Sir Horace Plunkett and his Work," *Fortnightly Review* (London, June, 1912)

PLU'RALISM (from *plural*, OF. *plurel*, Fr. *plurel*, from Lat. *pluralis*, relating to many, from *plus*, OLat. *pleor*, more, connected with Gk. *πλεον*, *pleion*, more, *πολύς*, *polys*, much, many, Skt. *puru*, OPers. *paru*, OIr. *ul*, Goth. *UIIG*, *filu*, Ger. *viel*, AS. *fedu*, archaic Eng. *fecl*, many, and ultimately with Eng. *full*) In canon law, the possession by the same person of two or more ecclesiastical offices, whether of dignity or of emolument. Pluralism has been held unlawful from the earliest times, and is forbidden by many ancient councils, as Chalcedon (451) and the second of Nicæa (787), on the ground of the impossibility, in ordinary cases, of the same individual adequately discharging the duties of more than one office. The rule by which dispensations from the law of residence are to be regulated, as well as the penalties for its violation, whether on the part of the patron or on that of the recipient, have formed the subject of frequent legislation. In general it may be said that the canon law regards as incompatible (1) two benefices each having the cure of souls, (2) two dignities, (3) a dignity and a cure of souls, (4) a cure of souls and a simple benefice requiring residence. In other cases than these the Pope is held to have the power of dispensing. Although a constant effort was made to prevent abuse, the evasions of the law were formerly frequent, especially for noble or learned persons, but now are very rare in the Roman Catholic church. The English law before the Reformation in the main coincided with the canon law, and the legislation of Henry VIII preserved the same general spirit, only substituting the dispensing power of the crown for that of the Pope. The practice is forbidden by the Pluralities Act of 1838, amended in 1850 and 1885, except that dispensations may be granted in case the churches are not more than 4 miles apart and the living of one not more than £200. Consult J. F. von Schulte, *Lehrbuch des katholischen und evangelischen Kirchenrechts* (Giessen, 1886); for England, *The Statutes Revised*, vol. viii (London, 1894)

PLURALISM. In philosophy, a term used to designate any theory that states the universe in terms of more than one ultimate principle. Its antonym is monism (q.v.), when used in the stricter sense. The prevailing tendency of rationalistic or intellectualistic philosophy is

towards monism, while empiricism leans always towards pluralism. Of recent years pluralism has been vigorously championed by William James (q.v.). Consult William James, *A Pluralistic Universe* (New York, 1909).

PLUSH (Fr. *pluche*, *peluche*, plush, shag, from Lat. *pilus*, hair). A variety of woven cloth, having a long shaggy pile on the upper surface. Although woven like velvet, it differs from it in the greater length of the pile and in its not being clipped or shorn to a uniform length. Formerly it was made of a double warp, one thread being usually double worsted yarn, the other, intended to form the pile, of goat's hair, and the filling of worsted; occasionally only worsted was used. Now it is made very extensively of silk and cotton, the silk taking the place of the goat's hair to form the pile. Recently the tussah silk, a wild silk of India, has been extensively used in the manufacture of plush. See **WEAVING**.

PLU'TARCH (Gk. Πλούταρχος, *Ploutarchos*) (c. 46-c. 125 A.D.). An encyclopædic writer and a charming type of the Greek gentleman and scholar of Roman times. He was born at Chæronea in Boeotia, the country of Hesiod and Pindar, to whom he often alludes. His writings introduce us to a pleasant circle of kinsmen and friends, his grandfather Lamprias, his father, brother, and four sons, his wife Timoxena, to whom he addresses a beautiful "consolation" on the death of their little daughter, his Roman friends Sossius Senecio, Metrius Florus, and Junius Arulenus Rusticus. His biography must be collected from his works. He was a student at Athens at the time of Nero's visit to Greece (66 A.D.). Later he traveled in Greece, Egypt, and Italy. He visited Rome more than once and remained there for some time in the reign of Vespasian, enjoying the friendship of prominent men, lecturing on moral philosophy, and gathering the materials for his historical works. Real mastery of the Latin language and genuine insight into Roman institutions, however, he never attained. He established himself for the last years of his life at Chæronea, paying frequent visits to Athens and to Delphi, where he exercised priestly functions. At Chæronea he held the office of archon and that of building inspector, recording his experiences perhaps in the treatise on the precepts of government and the essay on the question whether an old man ought to take part in politics. Greek moral philosophy being at that time the best substitute for religion, he became to many friends and young people a guide, philosopher, spiritual director, and physician of the soul, a rôle which a generation earlier Seneca, the Stoic philosopher (q.v.), had assumed with more self-consciousness and display at Rome. He recalled old memories of Rome and Athens in his "table talk." He wrote out his old lectures and gave new ones to the young people of an informal school that gathered about him. He composed dialogues in the manner of Cicero rather than of Plato. He continued his historical studies and published his parallel *Lives* of Greeks and Romans. These, the best known of his writings, have been called "the food of great souls" because of their power to kindle emulation in youth and the enormous influence which, through Jacques Amyot (q.v.), Montaigne, and Shakespeare, they have exercised upon modern literature. Forty-six of them are extant, arranged in 22 sets. They cover all classical antiquity

from Theseus-Romulus and Lysurgus-Numa to Demosthenes-Cicero and Alexander-Cæsar. They were not composed in the order of chronology or of their present arrangement. There are in addition four single biographies. The formal comparisons that follow most of the pairs are often somewhat forced. They stirred Shakespeare's sense of humor and provoked the delightful parody of Captain Fluellen's comparison of King Henry to Alexander on the basis of the resemblance of Macedon to Monmouth. (Consult *King Henry the Fifth*.) They may be spurious, as the comparison was a recognized form of rhetorical exercise. The *Lives* are avowedly character sketches with a moral rather than severe historical studies, but they belong to the small category of the world's books which are read by all educated men, not merely consulted by scholars, and whose influence spreads in ever-widening circles. Our knowledge of antiquity owes more to Plutarch than to any other one writer, and in the loss of his sources it is hardly necessary to add that the *Lives* become our primary authority for countless facts of history.

Hardly less interesting, though less known than the *Lives*, are the multifarious discursive or didactic essays and dialogues (some of them spurious) grouped under the title of *Moralia*. These comprise the nine books of Table Talk or Symposiaca, a curious illustration of the playful pedantry that was accounted good conversation in later Græco-Roman cultured circles; edifying moral disquisitions enlivened by anecdote and quotation on such topics as "How a Young Man Ought to Read Poetry," "How to Distinguish a Flatterer from a Friend," "On Exile," "On Superstition," "Rules for the Care of the Health," "Advice to the Married," etc.; more elaborate essays or dialogues on religious or philosophical topics—"The Banquet of the Seven Wise Men," "On Isis and Osiris," a chief source of our knowledge of Egyptian religion, "On the Failure of the Oracles," "On the Genius of Socrates," "On the Contradictions of the Stoics," "On the Creation of the World Soul in Plato's *Timæus*." Plutarch's intimate knowledge of Plato lends a certain unity and seriousness of tone to all this discursive literary productivity. He was widely read also in the literature of the Stoics and the Epicureans, but he refers to them mainly to refute them when they diverged from Plato.

Plutarch's style is that of an intelligent, widely read man, familiar with the vocabulary of philosophy and the sciences and more concerned for his matter than his manner. He does not affect Attic purism, and the tawdry rhetoric of his age has no attractions for him. He died somewhere between 120 and 130 A.D.

Bibliography. The entire text may be found in the *Teubner Series* and also in the *Didot Bibliotheca* (with Latin translation). Wyttenebach's unfinished 16-volume edition of the *Moralia* with *Index Græcitatibus* (Oxford, 1795-1830) is indispensable to the student. Gréard, *De la morale de Plutarque* (Paris, 1866), is a readable study. Volkmann, *Leben, Schriften und Philosophie des Plutarch* (Berlin, 1873), is scholarly and exhaustive. See also R. C. Trench, *A Popular Introduction to Plutarch* (London, 1873); Friedrich Leo, *Die griechisch-römische Biographie* (Leipzig, 1901); John Oakesmith, *The Religion of Plutarch as Expounded in his Ethica* (New York, 1903); Theodor Mommsen,

History of Rome, vol. v (trans. by W. P. Dickson, new ed., ib., 1905); G. D. Hadzsits, "Prolegomena to a Study of the Ethical Ideal of Plutarch and the Greeks of the First Century, A.D.," in *University of Cincinnati Studies*, vol. ii (2d series, Cincinnati, 1906); W. C. Wright, *A Short History of Greek Literature* (New York, 1907); Christ-Schmid, *Geschichte der griechischen Literatur*, vol. ii, part i (5th ed., Munich, 1911); and the article "Plutarchus," in Fr. Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914). The translation of the *Lives* revised by A. H. Clough (5 vols., New York, 1909) is a standard. For other translations of parts of the *Lives*, see PERRIN, BEHNADOTTE. North's version from the French of Amyot (q.v.), made in 1579, was reëdited by G. Wyndham in 1895. The *Moralia* may be read in the traditional translation revised by W. W. Goodwin (Boston, 1874-78).

PLUTEUS, plútê-ûs (Lat., parapet, partition, penthouse). In classical and early mediæval architecture, a section of a parapet or a slab filling up the space between two columns; an inclosure around an altar or other low screen.

PLUTO (Lat., from Gk. Πλούτων, *Ploutôn*, from πλοῦτος, *ploutos*, wealth). The Roman name for the Greek god of the lower world, properly called Hades. Two conceptions may be distinguished. One chiefly prominent in poetry represents him as the grim and implacable ruler beneath the earth, an enemy of all life, invisible, terrible, not to be appeased by sacrifice or prayer. His kingdom, though provided with palace and all else that belong to his state, is gloomy and full of horrors, while from it none ever escapes. The other conception seems to be found rather in some aspects of his cult and in popular belief. It is best expressed through his name Pluto, Giver of Wealth, and considers the ruler of the lower world as the owner and bestower of the products which are hidden in his kingdom, especially of the grain. This aspect seems prominent in the cult of Eleusis (q.v.), and it is significant that the name Pluto first occurs in Attic poets of the fifth century B.C. Naturally Hades is not prominent in the myths. He was considered a son of Cronos and brother of Zeus and Poseidon, to whom the depths of the earth and the kingdom of the dead were assigned after the overthrow of the Titans (q.v.). From the Cyclops he received his cap of invisibility, which belongs to him as the thunderbolt belongs to Zeus and the trident to Poseidon. In his chariot he suddenly burst from the earth and carried off Persephone (see CERES), who became his queen and regularly shared his cult. It should be noted, however, that this cult has to do with Pluto and with the milder aspect of the god. So far as can be seen, only at Pylas in Elis was there a sanctuary of Hades. This was opened only once a year, and then could be entered only by the priest. (See also HIERAPOLIS, I.) In art Hades is not a frequent figure, and no distinct type was developed to distinguish him. In general he differs from Zeus only in his expression, which is dark and stern; his hair hangs heavily over his brows. He is also fully and even heavily draped. In such scenes as the rape of Persephone modifications appear, and sometimes a wolf's-head helmet seems to represent the cap of invisibility.

In Rome the worship of Dis Pater and Proser-

pina was introduced in 249 B.C. in consequence of various omens, and games were held on three nights in the Campus Martius, accompanied by the sacrifice of black cattle. These games, according to the vow, were repeated in 146 B.C. and later were modified by Augustus. The place where the sacrifices were offered was called Tarantum, and the altar was 20 feet below the level of the ground and exposed to view only on the occasions of the sacrifices. Proserpina (q.v.) may have been an Italian goddess, but this joint cult is certainly of purely Greek origin and almost certainly borrowed from Tarantum. Consult: Otto Gruppe, *Griechische Mythologie und Religionsgeschichte* (2 vols., Munich, 1906); L. R. Farnell, *The Cults of the Greek States*, vol. iii (Oxford, 1907); C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911); Georg Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

PLUTO MONKEY. A West African monkey (*Lasiopyga*, or *Cercopithecus*, *pluto*), one of the guenons of Angola, which is distinguished by the reddish-black color of the underparts and generally dark fur. The forehead of this species has a white band and the cheeks bear bushy gray whiskers.

PLUTONIC ROCKS (from Lat. *Pluto*, god of the lower world). The name given to those igneous rocks which have consolidated at considerable depths in the earth and have subsequently been brought to the surface by the denudation and removal of the overlying strata. As a class they are contrasted with the volcanic rocks which have solidified at or near the surface. Most of the coarse-grained igneous rocks, especially granites, are of plutonic origin. See IGNEOUS ROCKS.

PLUTONIUM. See HIERAPOLIS, 1.

PLUTUS (Lat., from Gk. Πλούτος, *Ploutos*, from πλούτος, *ploutos*, wealth). In Greek mythology, the god of riches, son of Demeter and Iasion. According to the legend, Zeus blinded him that he might not be able to discriminate in his gifts, and in the *Plutus* of Aristophanes he appears as a blind old man. In art, however, he was usually represented as a child, and in the arms of some goddess, such as Tyche (Fortune), or Athena Ergane (the Worker), or Eirene (Peace).

PLUVIOSE, plu'v'ë'öz' (Fr., rainy). The name given to the fifth month of the French Republican calendar, beginning on January 20, 21, or 22 and ending on February 19, 20, or 21.

PLUVIUS. An epithet of Jupiter (q.v.) as the giver of rain.

PLYM'LEY, PETER. An assumed name under which Sydney Smith published a series of vigorous letters in defense of Catholic emancipation (1807-08).

PLYMOUTH, plim'úth. An important seaport, parliamentary and county borough, in the southwest of Devonshire, England, 200 miles (direct) west-southwest of London (Map: England, B 6). It stands in the Bight of Plymouth Sound between the estuaries of the Plym and Tamar. To the west is East Stonehouse, a township and coastguard station, and still farther west is Devonport (q.v.), the great naval and military station. United by continuous lines of houses, they form an aggregation known as the Three Towns, which constitutes one of the most important ports in England. Plymouth proper may be called the city and Devonport the west

end, while East Stonehouse is an intermediate district, containing chiefly factories, barracks, victualing yards, hospitals, and other institutions. Plymouth extends from Mill Bay on the west to the mouth of the Plym on the east. Its site is somewhat rugged and uneven; an eminence forming the suburbs runs along its northern side, and another eminence, partly occupied by the citadel, fronts the Sound. The chief buildings are the Royal Hotel, comprising an immense inn, assembly rooms, a theatre, and the athensium; the public library, containing in its Cottonian collection 300 sketches by the old Italian masters; St. Andrew's Church, the tower of which dates from 1490 (the church was restored in 1874); and Charles Church (1646-58), dedicated to St. Charles the Martyr. There are several important educational establishments, some of which are endowed, and many charitable institutions. The guildhall and municipal buildings form a handsome Gothic group. The city contains an arsenal, a dockyard, and other government buildings, and a marine biological laboratory. Mill Bay and Sutton Pool are small inlets of the Sound, in which lie the merchant vessels bound for Plymouth proper. Between these inlets, and running along the shore, is the eminence called the Hoe, embellished with interesting monuments. From this ridge, whence the approach of the Spanish Armada is said to have been first descried, magnificent shore and sea views may be obtained. Its eastern end is occupied by the citadel, which commands the entrance of the Cutwater (the lower estuary of the Plym) and of Sutton Pool. Mill Bay on the west is so deep that vessels of 3000 tons can lie at the pier at low water. The principal industries are shipbuilding and fisheries; the manufactures are unimportant, the chief being chemicals; but as a naval station, the centre of the Devonshire and Cornwall trade, and as a holiday and health resort, Plymouth holds a prominent position. It carries on a considerable foreign trade. It has fine docks, harbors, and extensive quayage, and a breakwater completed in 1841 protects the Sound with its spacious inner anchorage. The principal exports are lead, tin, copper, and granite; imports, agricultural products and timber. Plymouth was the first English town incorporated by Act of Parliament, its charter dating from Nov. 12, 1439. It owns the oldest municipal water works in England, originated in 1585 by Sir Francis Drake, the navigator, then mayor of the town. It owns also profitable real estate, the Royal Hotel, already mentioned, abattoirs, markets, a refuse destructor, the heat of which is utilized to generate electric light and power, electric tramways, suburban artisans' dwellings connected by tramways which carry workmen for a penny, baths, and washhouses, and maintains free libraries, a technical school, museum and art gallery, the Hoe Park and pleasure grounds, hospitals, and a lunatic asylum. The population of the Three Towns in 1901 was 193,184, having tripled since 1821; in 1911, 207,446, that of Plymouth proper was 107,636 in 1901 and 112,030 in 1911. The area of the Three Towns, in land and water, is 5719 acres; of Plymouth, 3152 acres.

Plymouth, described by Leland as being, in the reign of Henry II, "a mene thing, an inhabitation of fishers," was called by the Saxons Tame-worworth (town on the Tamar); after the Conquest it was called Sutton (south town); and

it was not till the reign of Henry VI that it received the name of Plymouth (mouth of the Plym). During the fourteenth and fifteenth centuries it was frequently attacked and set on fire by the French, and in 1512 an Act was passed for the strengthening of its defenses, which since then have been greatly increased, until now the entire shore of the Sound is well defended by cannon, while a cordon of inland forts, constructed at immense cost, surrounds the Three Towns at a distance of from 2 to 3 miles. Plymouth witnessed the departure of Drake's noted expedition to circumnavigate the world in the reign of Elizabeth, and her fleet went forth from here to encounter the Spanish Armada. The Pilgrims on board the *Mayflower* set sail for America from Plymouth on Sept. 6, 1620. During the Cromwellian War the town successfully sustained a siege of four years for the Parliamentary cause; it was the first large town to proclaim William of Orange King of England. Consult R. N. Worth, *History of Plymouth, from the Earliest Period to the Present Time* (Plymouth, 1871), and F. M. Williams, *Plymouth* (ib., 1898).

PLYMOUTH. A town in Litchfield Co., Conn., 10 miles north of Waterbury, on the New York, New Haven, and Hartford Railroad (Map: Connecticut, C 3). It has saw mills, granite works, etc. Pop., 1900, 2828, 1910, 5021.

PLYMOUTH. A city and the county seat of Marshall Co., Ind., 84 miles east-southeast of Chicago, on the Lake Erie and Western, the Pennsylvania, and the Vandalia railroads (Map: Indiana, E 2). It is a commercial centre and residential place, with manufactures of baskets, barrels, binder slats, emery, grinders, and novelties. Among the noteworthy features are the Julia E. Work Training School, St. Michael's Academy, Plymouth Sanitarium, and the public library. The water works are owned by the city. Settled in 1835, Plymouth was incorporated in 1852. Pop., 1910, 3838.

PLYMOUTH. A town, port of entry, ranking in foreign imports in the State next to Boston, the county seat of Plymouth Co., Mass., situated 37 miles southeast of Boston, on the New York, New Haven, and Hartford Railroad, and extending for 18 miles along Plymouth harbor, an arm of Massachusetts Bay (Map: Massachusetts, F 5). It is the oldest town in New England, having been the landing place of the Mayflower Pilgrims, who made it the first permanent English colony north of Virginia. Among the features of interest are Plymouth Rock, now covered by an open granite structure; Burial Hill and Cole's Hill, where many early settlers were buried; Leyden Street, on which the first Pilgrim houses were built; Pilgrim Hall, with its collection of paintings and relics; and the National Monument to the Pilgrims, dedicated in 1889. The statue of "Faith," 36 feet in height, is mounted on a granite base 45 feet high, surrounded by four large buttresses on which are massive monolithic figures of "Morality," "Law," "Education," and "Freedom." Other notable structures are the Federal Building (including post office and custom-house), the Russell Public Library, Jordan Hospital, and the public-school buildings. There are also a beautiful forest park of 200 acres and a municipally owned water-supply system. Plymouth is a well-known summer resort, attracting more than 100,000 visitors annually,

and is of considerable commercial and industrial importance. The principal manufactures include cordage and wheat-binder twine, tacks, rivets, woolen goods, stoves, foundry products, rubber goods, insulated wire, electrical zinc manufactures, etc. Pop., 1900, 9592; 1910, 12,141, 1914 (U. S. est.), 13,227.

See MASSACHUSETTS.

PLYMOUTH. A town and one of the county seats of Grafton Co., N. H., 52 miles by rail north by west of Concord, on the Pemigewasset and Baker rivers and on the Boston and Maine Railroad (Map: New Hampshire, F 5). Situated in a region noted for its scenic attractions, Plymouth is a popular summer resort. It is the seat of the State Normal School and has a public library. The Holderness School for Boys is near by. There are manufactures of shoe pegs, buckskin gloves, sporting goods, lumber, silverware, and wood pulp. Nathaniel Hawthorne died here, and the old courthouse is famous as the scene of Daniel Webster's first appearance as a lawyer. The town owns its water works. Pop., 1900, 1972; 1910, 2200. Consult E. S. Stearns, *History of Plymouth, New Hampshire* (2 vols., Plymouth, 1906).

PLYMOUTH. A town and the county seat of Washington Co., N. C., 162 miles east of Raleigh, on the Roanoke River, near Albemarle Sound, and on the Atlantic Coast Line and the Norfolk and Southern railroads (Map: North Carolina, F 2). It is the trade centre for a fertile region, the chief products of which are cotton, peanuts, tobacco, rice, farm produce, and lumber. There are lumber and veneer mills. Pop., 1900, 1011, 1910, 2165.

PLYMOUTH. A borough in Luzerne Co., Pa., 4 miles west of Wilkesbarre, on the Susquehanna River and on the Delaware, Lackawanna, and Western Railroad (Map: Pennsylvania, K 4). It is interested principally in coal mining and in the coal trade, being situated among the rich anthracite fields of the State. The chief products of its industrial establishments include mining drill machines, miners' squibs, hosiery, silk, lumber products, etc. Plymouth was settled in 1768 by the Susquehanna Company, and until the Pennamite-Yankee War in 1799 was claimed by Connecticut. Coal was first shipped in 1807. Pop., 1900, 13,649, 1910, 16,996; 1914 (U. S. est.), 18,422. Consult Wright, *Historical Sketches of Plymouth, Pennsylvania* (Philadelphia, 1873); French, *Reminiscences of Plymouth* (New York, 1914).

PLYMOUTH. A city in Sheboygan Co., Wis., 14 miles west of Sheboygan, on the Chicago, Milwaukee, and St. Paul and the Chicago and Northwestern railroads (Map: Wisconsin, F 5). It contains a Carnegie library, county fair grounds, and Fountain Park. There are important cheese interests and, among the industrial establishments, large coal-storage plants, flour mill, brewery, and manufactures of furni-

ture, gasoline engines, and feed cutters. The water works and electric-light plant are owned by the city. Pop., 1900, 2257; 1910, 3094.

PLYMOUTH BRETHREN. A religious sect which sprang into existence in the British Isles during the first half of the nineteenth century and has extended itself throughout the British dominions and in certain parts of the continent of Europe, particularly among the Protestants of France, Switzerland, and Italy, and in the United States of America. They do not use the name themselves, preferring to be called simply Believers, Christians, or Brethren. Their origin seems to have been due to a reaction against exclusive High Church principles in the Church of England and similar tendencies in other churches, and against a dead formalism associated with unevangelical doctrine. While several communities appeared almost simultaneously in various places, the foundation of the body is generally ascribed to the labors and influence of John Nelson Darby, from whom on the continent of Europe they are commonly known as Darbyites. Darby was born in London in 1800; he was graduated B.A. at Trinity College, Dublin, in 1819, and was called to the Irish bar in 1825. He withdrew from the Church of Ireland because of the conscientious scruples regarding the scripturalness of Church establishments; he also believed that denominational distinctions and a regular ministry should be discarded. He found others who shared his views, notably Anthony Norris Groves, a student at Trinity College, and an association was formed in Dublin in 1828. Another was soon organized in Plymouth, and the fact that Providence Chapel in that town was the first regular place of meeting gave rise to the name Plymouth Brethren in 1830. Darby continued to labor as an evangelist, unconnected with any church, in England and on the Continent, until his death in 1882. He preached in English, French, and German, wrote voluminously, and edited a quarterly periodical, the *Christian Witness*, which for a number of years was the official organ of the Brethren. His collected writings have been published in 32 volumes (London, 1867-83).

The doctrines of the Plymouth Brethren are Calvinistic. They emphasize original sin, predestination, the efficacy of Christ's sacrifice, and salvation by personal acceptance of the atonement of Christ. Millenarian views are also generally entertained. They practice the baptism of adults without regard to previous infant baptism. They hold meetings for Bible study and prayer, and observe the Lord's Supper weekly on Sunday. Their most distinctive peculiarity is their refusal to recognize any form of Church government or any office of the ministry; they insist on the equal right of every male member of the Church to prophesy or preach. They do not build churches, but meet in halls or private houses. A great schism took place among them during Darby's lifetime because of doctrines preached at Plymouth and Bristol concerning the human nature of Christ, and they have been frequently divided on narrow lines. There are four divisions in the United States. In 1915 there were 403 meetings and 10,566 communicants in the United States. Consult the biographies of eminent members of the sect, as those of A. N. Groves, by his widow (3d ed., London, 1869), and Henry Craik, by Taylor (ib., 1866); the writings of B. W. Newton and W. Kelly; also Dorman, *The Close of Twenty-*

eight Years of Association with J. N. Darby (London, 1866); Henry Groves, *Darbyism: Its Rise and Development* (ib., 1866). For hostile criticism: J. L. C. Teulon, *The History and Teaching of the Plymouth Brethren* (London, 1883); W. B. Neatley, *A History of the Plymouth Brethren* (2d ed., ib., 1902); H. K. Carroll, *Religious Forces in the United States* (New York, 1912).

PLYMOUTH CHURCH. The church in Brooklyn, N. Y., made famous by the long pastorate of Henry Ward Beecher. The society was organized in 1847 and the present structure, seating 1800 persons, was erected in 1849. There have been three pastors: Henry Ward Beecher, 1847-87; Lyman Abbott, 1888-90; and Newell Dwight Hillis, 1899-. The membership in 1915 was upward of 2100.

PLYMOUTH COLONY. See MASSACHUSETTS.

PLYMOUTH COMPANY. A joint-stock organization chartered by King James I in 1606 in conjunction with the London Company to plant colonies in North America, the London Company to plant them between lat. 34° and 38°, the Plymouth Company to plant them between lat. 41° and 45°, and the company that should plant the first colony to have the right subsequently to plant in the territory between lat. 38° and 41°. The Plymouth Company planted a colony in 1607 at the mouth of the Sagadahoc, or Kennebec, River, but this was abandoned the following year, and after repeated failures the company was superseded in 1620 by the Council for New England. See LONDON COMPANY.

PLYMOUTH ROCK. A ledge of rock in Plymouth harbor, Massachusetts, on which the Pilgrims are said to have stepped when disembarking in 1620. A beautiful granite canopy has been erected upon the rock.

PLYMOUTH ROCK. A breed of domestic fowls, popular and numerous throughout the United States, in several varieties. It is of large size and has admirable qualities for market purposes. The favorite variety is the barred, of a grayish-white color, every feather marked with many curving black bands. There are also clear white and clear buff varieties. The standard weight of the cock is 9.50; of hens, 7.50 pounds. See Colored Plate of Fowls, under POULTRY.

PLYMOUTH SOUND. A beautiful inlet of the English Channel between Cornwall and Devonshire, forming the harbor of Plymouth and Devonport, which is an important British naval station (Map: England, B 6). See PLYMOUTH, and the article BREAKWATER.

PLYNLIM'MON, or PLINLIM'MON. A mountain of Wales, on the boundary between the counties of Montgomery and Cardigan, 2481 feet in height. Although only 12 miles from the coast, it is in the midst of a wild waste of moor and bogs. On its slopes are the sources of the rivers Wye and Severn.

PNEUMATIC (nū-măt'ik) **CAISSONS.** See FOUNDATION.

PNEUMATIC CLOCKS. See CLOCK.

PNEUMATIC DISPATCH (Lat. *pneumaticus*, from Gk. *πνευματικός*, *pneumatikos*, relating to wind or air, from *πνεῦμα*, *pneuma*, air, wind, spirit). A method of sending mail matter, telegraphic dispatches, parcels, etc., through a tube by means of air pressure. The matter to be transported is placed in a carrier so designed as to fit closely the inside of the tube while being free to move, this carrier being propelled forward by introducing air under pressure behind it or by exhausting the air in front of it. Pneumatic dispatch was discussed as early as 1687 by Denis Papin, in a paper before the Royal Society of London. A practical pneumatic dispatch system was described by Medhurst, an Englishman, in 1810. He was followed by other inventors, some of whom achieved mechanical success, but it was not until 1853-54, when a tube 220 yards long was built in London by the Electric and International Telegraph Company, to convey telegraph dispatches, that a practical working pneumatic system was put in actual operation for commercial purposes. This system was designed by Josiah L. Clark and employed a tube $1\frac{1}{2}$ inches in diameter, in which

the system has been gradually extended since. The tubes were laid in circuits, but instead of operating the circuit from a single power station each station of the circuit has a power plant, and the sections of tubes between any two stations can be operated independently of the rest of the circuit. The carriers are run in trains, each train being propelled by a piston which pushes the rear carrier of the train, and these trains are dispatched every 15 minutes. Every train stops at all stations, where the carriers for that station are taken out and others for succeeding stations are inserted.

The London system of pneumatic dispatch differs from those of continental cities just mentioned chiefly in being a radial system instead of a circuit system. The tubes of this vast system radiate from a central power station to substations located at various points. The first London tube was installed by Siemens Brothers in 1870, but the present lines have been greatly improved over the original construction and systems of pneumatic dispatch are naturally common to other British cities. Mention should be made of the small tunnels and

SENDING AND RECEIVING APPARATUS.

the carriers were dispatched in one direction only. This system was improved by C. F. Varley, who succeeded Mr. Clark as the engineer of the company named and who increased the diameter of the tubes to $2\frac{3}{4}$ inches and operated the carriers in both directions, using vacuum for sending in one direction and compression for sending in the other direction. Siemens Brothers, of Berlin, Germany, later proposed a circuit system in which two tubes were used, the up tube being connected to the down tube at the distant end; the air was compressed into one end of the circuit and exhausted at the other end, and furthermore it was kept in constant circulation, so that carriers were dispatched by inserting them into the tube without stopping the air current. To stop the carriers a wire screen could be inserted across the tube which would permit the air to pass, but would stop the carrier.

The first extensive application of the Siemens system was made in Berlin, Germany, in 1865, when a circuit was built between the telegraph station and the Exchange requiring 5670 feet of $2\frac{1}{2}$ -inch wrought-iron tube. This experimental line proved so successful that the system was rapidly extended with better methods of operation until in 1897 there were 38 stations and 28 miles of tubes in use. In 1866 the first stretch of pneumatic tube was laid in Paris, and

atmospheric railway first built in London in 1863, from Euston to a station in Eversholt Street, 1800 feet, and extended in 1872 from Euston to the general post office, 14,204 feet. These were used to carry the mails for a time, but were found to be slow and expensive and were abandoned in favor of tubes.

Perhaps the first attempt at pneumatic dispatch in America was made by A. E. Beach, who invented and exhibited a full-size working model of an atmospheric railway in 1867. Some years later Mr. Beach began the construction of an atmospheric railway tunnel under Broadway, New York City, and had completed a short distance of tunnel when the work was abandoned.

The use of pneumatic dispatch in America has become quite extended and perhaps the most extensive application is of small pneumatic tubes in stores for dispatching cash to and from a centrally located cashier's desk and for the transportation of various documents, cards, etc., in a modern large office building or hotel. There are three systems in general use, known as vacuum, pressure, and vacuum pressure, each with its advantages and disadvantages, the vacuum system being used for lighter service. The carriers are made of leather or brass with felt ends, and the whole system has to be designed most carefully for the service for which it is intended. Seamless brass tubing is gen-

rally used, which is usually $2\frac{1}{4}$, 3, or 4 inches outside diameter, with tubes of oval section 3 by 6 inches in some systems. The ends are of brass, irrespective of the material of the straight lengths, which may be iron, steel, or aluminium as well as brass. An interesting use of pneumatic dispatch is in the manufacture of photographic plates and films, where they are transferred from dark room to lark room by carriers, the power being supplied by rotary blowers. The Western Union Telegraph Company early had pneumatic dispatch systems in use in New York and Chicago, and similar private systems are in use elsewhere, including modern railway freight yards to facilitate operation.

In 1893 the United States Post Office Department installed pneumatic dispatch between its main post office and its substation at the Bourse, Philadelphia. This line was 2974 feet long, with tubes $6\frac{1}{8}$ -inch inside diameter, and the carriers traveled at a speed of about 25 miles per hour, this being an average speed for American post-office tubes, where the rate varies from 15 to 30 miles an hour. The Philadelphia system was later extended by $8\frac{1}{8}$ -inch tubes to the terminal stations of the Pennsylvania and the Philadelphia and Reading railways. In 1897-98 there were installed 683 miles of pneumatic dispatch connecting the general post office in New York City with the Brooklyn post office, the Grand Central Terminal, and intermediate substations. Congress, by an Act dated June 2, 1900, ordered a committee of experts to investigate and report upon the cost, construction, and utility of such systems for these and other large cities. This committee held investigations in 11 cities and submitted a report in 1901. By 1911 the United States Post Office Department had increased its mileage to $113\frac{1}{2}$, distributed approximately as follows: New York, $57\frac{1}{4}$; Philadelphia, 20; Boston, 14; Chicago, $18\frac{1}{4}$; St Louis, 4. As the tubes are always in pairs these figures of course represent twice the total distances between the various stations. In New York there are five main lines radiating from the central post office with 25 tube stations, 10 of which are equipped with power plants for compressing the air, while a line of 8-inch tubes is maintained between the Custom House and Appraisers Warehouse.

The Batcheller system, first installed at New York and Philadelphia in 1901, employs compressed air at a pressure of from 3 to 12 pounds, often with extra power up to 25 or 30 pounds available to remove blocks in the lines. The compressed air may be furnished by any improved type of air compressor or high-pressure blower and forces the carriage through a cast-iron pipe which is bored true and carefully jointed. The tubes, 6 and 8 inches in diameter, are laid in a double line to facilitate traffic in

of each carrier gives access to the interior. They are from 16 to 30 inches in length, carry from 200 to 600 ordinary letters, and weigh, filled, about 30 pounds. Near each end are placed packing rings of cotton fabric secured to the main body by metal collars so as to insure a close fit in the tube. These packing rings are lubricated by vaseline, which makes easy running possible. The sending and receiving apparatus, which is located at each end and also at intermediate stations on the line, and typical forms are shown in the illustrations. In the sending apparatus two sections of the tube are supported in a swinging

SENDING APPARATUS.

frame so that either can be brought into line with the main tube, through which there is a constant current of air. After a carrier has been placed in an iron trough it passes into an open tube section and is then swung into position so that it is in line with the main tube and the carrier is swept along by the pressure. The carriers usually have a headway of from 5 to 15 seconds each and may be dispatched automatically. There are various forms of receivers, the use of which depends upon various conditions of atmospheric pressure. The action of the receiving apparatus is automatic, and as soon as a carrier arrives in the receiving chamber the latter is tilted, the carrier is discharged, and the receiving chamber returned to its normal horizontal position. Automatic apparatus is also employed at the intermediate stations, and the carriers designed for a particular station are turned aside from the main-line tube. Usually the entire system is under the direction of a competent chief at a central station who is in telephonic connection with all the various branches and supervises the distribution of carriers and other features of operation. The use of pneumatic apparatus is constantly increasing, and there are cities in the United States in which it is being installed for the transmission of small packages.

Consult: B. C. Batcheller, *The Pneumatic Dispatch Tube System* (Philadelphia, 1897); id., "Development of a System of Underground Pneumatic Tubes for the Transportation of United States Mail," in *Congress of Technology* (Boston, 1911); *Technology and Industrial Efficiency* (New York, 1911); F. B. Williams, "Pneumatic Conveyers," in *American Society of Mechanical Engineers Journal*, vol. xxxvi (ib., 1914). The results and conclusions of the committees appointed to investigate the subject of pneumatic dispatch for the United States Post Office Department have been published

SECTION OF CARRIER.

opposite directions. The carriers, over 2000 of which are used in New York City, are symmetrical in form, of the general shape shown in the illustration, and of a diameter about one inch less than that of the tube. A door in the end

from time to time by the Postmaster-General (Washington, D. C.).

PNEUMATIC GUN. A gun in which the expansive force of air under pressure is employed to discharge a thin-walled shell containing a quantity of high explosive. A pneumatic gun, the invention of Capt. E. L. Zalinski, U.S.A., was designed to discharge projectiles loaded with a high explosive, such as dynamite, the shock of the discharge being kept low by using the expansion of compressed air as the projecting force. Pneumatic guns have not proved a success. See AIR GUN.

PNEUMATICS. The branch of mechanics which treats of the properties of gases, either at rest or flowing, and of solids immersed in gases. See GASES, GENERAL PROPERTIES OF.

PNEUMATIC TIRE. See BICYCLE, MOTOR VEHICLE.

PNEUMATIC TOOLS. The name given to a class of portable, self-contained motor tools (generally hand tools), for metal and wood working, operated by compressed air. Pneumatic tools are of two types, viz., percussion tools and rotary tools. The motive power used in both is air under pressure, and the motor is contained within the tool. The variety of purposes to which pneumatic tools are put is very

could be used also for riveting. This tool was the first to show a grasping handle with manually controlled throttle valve. In 1867 Deering, also an Englishman, patented a rock drill with pressure valve control and in 1897 Dr. S. W. Dennis in the United States patented a dental mallet, the first pneumatic hand tool. In 1896 came a chipping hammer by Boyer of St. Louis, and in 1899 a long-stroke pneumatic hammer where a short piston traveled a distance greater than its own length. Boyer's hammers, the first to be extensively used, were followed by those of Keller, Kimman, Richards, Meissner, and others.

The variety of constructions by which the piston stroke is actuated and controlled is large, but generally speaking all pneumatic hammers may be classed either as valveless hammers or valve hammers, one of the former class, the Keller tool, first brought out in 1899, being shown in the diagram and in various application on the accompanying plate. The Tierney hammers for riveting and chipping also found wide application. The valveless hammers have no valve beyond the striking piston, this being itself a valve to effect the proper admission of air to alternate ends of the working cylinder. In the valve hammers a reciprocating valve,

SECTION OF KELLER PNEUMATIC HAMMER ARRANGED FOR RIVETING, SHOWING OPERATING PARTS.

great, and new appliances are being constantly discovered. Some of the general mechanical operations to which such tools are applied are hammering, ramming, calking, chipping, riveting, shaving, drilling, boring, screwing, clipping, carving, and expanding tubes. These operations nearly all permit the primary mechanical actions of the tool, percussion and rotation, to be employed without modification.

Percussion Tools. The mechanism employed for utilizing compressed air to secure percussive action is similar in all percussion tools, and it will be sufficient to describe the hammer. The pneumatic hammer consists essentially of a cylinder containing a piston which, by means of suitable cylinder inlet and exhaust openings for air under pressure, is made to reciprocate back and forth in the cylinder. A tool is inserted into the front end of the cylinder loosely in such a way that the reciprocating piston or hammer strikes its near end at each forward stroke, the action being exactly analogous to that of a man driving a chisel with a hand hammer. The near end of the cylinder terminates in a handle, by which the tool is held by the operator. Compressed air is conveyed to the cylinder by means of a suitable connection or a flexible hose.

The first useful pneumatic tool was a rock drill having a hammering piston which was patented in England by George Law in 1865, and his specifications stated that this device

working either at right angles to or parallel with the striking piston, acts in combination with it to regulate the inlet and the exhaust of the compressed air.

There are several constructions of both valveless and valve hammers, each of which is controlled by patents owned by the manufacturers of such tools. The general characteristics and comparative merits of the two forms of construction may be summarized as follows: valveless hammers have essentially a short stroke, and although economical in air consumption in relation to the number of blows given, they do not compare with valve hammers in giving powerful blows, which are necessary in heavy chipping and riveting. Owing, however, to their simple construction, they have probably a longer life than valve hammers, and for such purposes as beading flues, light calking and chipping, and especially carving in stone, they compare very favorably with their rivals.

The speed of the valveless hammers is very high, being from 10,000 to 20,000 strokes per minute. The speed of valve hammers for ordinary work ranges from 1500 to 2000 blows per minute, although they can be driven much faster. Their stroke is considerably longer than that of valveless hammers, and the blow struck is correspondingly more compelling. These characteristics of valve hammers make them most suitable for general and heavy clipping, calking, and riveting. This comparison is a fair sum-

PNEUMATIC TOOLS

4. PNEUMATIC RIVETING HAMMER.

5. CALKING A BOILER.

mary of recent engineering opinion on the subject, but advocates of one or the other form naturally contest the claims of their opponents.

The preceding description has referred particularly to hammers; by replacing the hammer tool struck by the piston as above described with sharpened or otherwise specially formed tools we have the hammer converted into a tool for chiseling, chipping, beading, calking, riveting, etc. In operation the apparatus is held by the handle so that the tool presses firmly against the work; air pressure is then turned on by pressing a trigger or thumb lever on the handle and the reciprocating piston begins to strike the tool, which is thus caused to cut or hammer the work in front of its nose. As previously stated, the blows are exceedingly rapid, their sound coming to the ear as a continuous buzz, and they depend for their effect upon their great frequency rather than upon their individual energy. Pneumatic percussion tools are made in a variety of sizes, but with the exception of riveters their weight and dimensions are kept small enough to permit them to be manipulated by hand. As specially designed for riveting work the percussive pneumatic tool requires brief special description. Any of the regular hammer tools may be used for riveting in connection with a holder-up for supporting the butt of the rivet, but such work is more effectively accomplished by heavier tools having a longer stroke. The yoke riveter is another common form and consists of a U-shaped yoke having at the end of one arm an inwardly projecting holder-up. The yoke riveter is made in several modifications designed for special purposes and requires generally to be handled by chain or pneumatic hoists or other power. (For illustration, see METAL-WORKING MACHINERY.) In clipping tools the stroke of the piston is reduced enormously in speed and it is provided with a piston rod which acts on a suitable hinged link construction to convert its rectilinear motion into a pincer-like movement of the clipping edges or jaws. In the forms of percussion pneumatic tools described the intensity of air pressure used is from 80 pounds to 100 pounds per square inch for all work except riveting, where it is usually increased up to 125 pounds per square inch.

Rotary Tools. Rotary pneumatic tools, commonly called portable pneumatic drills, are used for drilling and boring wood and the analogous operations of reaming, tapping, tube expanding, screwing nuts on bolts, boring cylinders and Corliss engine valve seats; also for turning crank pins, grinding steam-pipe joints, and cleaning castings. The method by which compressed air is utilized for driving the drills is generally by means of single or double acting cylinder motors, the cylinders of which are sometimes fixed and sometimes oscillating, which actuate suitable mechanism for turning the bit and are inclosed in the body of the drill. Rotary motors also are used, and an example of one of these, the Keller tool, is shown diagrammatically in the illustration and in actual use on the accompanying plate.

Pneumatic drills are made in a large number of sizes, from light drills suitable for small holes up to machines of two or three horse power. They work with from 60 pounds to 80 pounds air pressure. For performing different kinds of work, assuming the size to be ample, the only change necessary is the substitution of the

proper tool (drill, auger, saw bit, reamer, etc.) in the tool holder. A description of the motor construction of several well-known tools will give a fair idea of this mechanism. In the Little Giant drill the motor consists of four single-acting cylinders arranged in pairs and coupled

KELLER PNEUMATIC DRILL OPERATED BY ROTARY MOTOR.

to opposite ends of a crank shaft. The crank shaft carries pinions which gear with spur wheels on the tool shaft. The entire mechanism is inclosed in a shell shaped like the section of a circular cylinder. The Whitelaw drill has two double-acting oscillating cylinders geared to a crank shaft which carries a single pinion gearing with a spur wheel on the tool shaft. In the Boyer piston drill the motor is in the form of a three-cylinder single-acting oscillating engine, the cylinders being carried in a rotary frame, which, since the cylinder pistons are coupled to a fixed crank, rotates and by means of suitable gears causes the tool shaft to rotate. The motor mechanism is all inclosed in a cylindrical casing. Air is piped to these rotary tools by flexible hose exactly as in the case of percussion tools. See *DRILL, Rock Drills*, for pneumatic drills used in mining.

PNEUMATOMACHI, nū'má-tóm'a-ki. See MACEDONIANS.

PNEU'MOCOC'CUS. See Plate of DISEASE GERMS.

PNEU'MOCO'NIO'SIS (Neo-Lat., from Gk. πνεῦμα, *pneumōn*, lung + κοῖα, *koma*, dust + -ωσις, -*osis*). A pulmonary affection developing in those who habitually breathe dust-laden air. It is essentially an occupational disease. Occurring in miners it is called anthracosis and is caused by the inhalation of coal dust. Particles of iron and stone are inhaled by metal grinders and constitute the exciting factor in siderosis (grinders' rot). In those who work with stone alone the affection is known as lithosis, chalcosis, or stonecutters' phthisis. The term "kaolinosis" is applied to the affection as

seen in clay workers. The most prominent manifestation of the disease is chronic bronchitis. A catarrhal condition is established, the peribronchial lymph nodes are infiltrated, ulceration and isolated areas of pneumonia are succeeded by fibrous changes, and the lungs finally become shrunken, hard, and pigmented. The discoloration in anthracosis is black or slaty; the oxides of iron give a reddish hue to the tissues; stone and clay dust confer a yellowish tinge. The mortality among workers in dusty trades, in the absence of proper safeguards, is enormous. The treatment of fibroid phthisis, to be effective, necessitates a change of occupation. See OCCUPATIONAL DISEASES.

PNEUMOGASTRIC (nū-mō-gās'trīk) **NERVE** (from Gk. *πνεύμων*, *pneumōn*, lung + *γαστήρ*, *gastēr*, stomach), **NERVUS VAGUS**, or **PAR VAGUM**. A nerve which derives the first of its names from its supplying the lungs and stomach with nervous filaments, and the second from the wandering course it pursues. It emerges from the medulla oblongata by 8 or 10 filaments, which unite and form a flat cord that escapes from the cavity of the cranium (in association with the glossopharyngeal and spinal accessory nerves) by the jugular foramen. In this foramen it forms a well-marked ganglionic swelling, while another is observed immediately after its exit from the skull. The nerve runs straight down the neck, between and in the same sheath as the internal jugular vein and the carotid artery. Below the root of the neck its course is different on the two sides; the right nerve, running along the back of the œsophagus, is distributed to the posterior surface of the stomach, and finally merges into the solar plexus; while the left nerve runs along the front of the œsophagus to the stomach, sending branches chiefly over its anterior surface.

The pneumogastric is a mixed nerve, containing filaments both of sensation and of motion. The pulmonary branches exercise a most important influence on the respiratory acts, for when the pneumogastriacs on both sides have been divided above the giving off of the pulmonary branches, the most severe dyspnœa comes on, the number of respirations is much diminished, and breathing becomes asthmatic. The gastric branches influence the movements of the stomach, but their destruction does not materially affect the secretion of the gastric juice. Loss of voice and difficulty of breathing have been frequently traced to the pressure of an aneurism or other tumor on the recurrent or inferior laryngeal branch. The sympathy that exists between the digestive and the respiratory and circulatory organs is explained by the anatomical relations of this nerve. For example, both asthma and palpitation of the heart are often to be traced to some deranged state of digestion. Vomiting may be excited by irritation of the central or the distal extremities of the nerve. In disease of the brain the vomiting, which is often an early symptom, is caused by irritation of the central extremity; while, on the other hand, by introducing emetic substances into the stomach the vomiting is produced by the irritation of the peripheral (or distal) filaments.

PNEUMONIA, nū-mō'nī-ā (Neo-Lat., from Gk. *πνευμονία*, disease of the lungs, from *πνεύμων*, *pneumōn*, lung, from *πνέειν*, *pneîn*, to breathe). An inflammation of the substance of the lung.

There are two well-defined types, acute lobar

pneumonia and broncho-pneumonia. Under the older classification a third form is included, viz., chronic interstitial pneumonia, which will be described here. Lobar pneumonia, which is the condition usually meant when we speak of pneumonia, is an acute specific disease caused by the *Diplococcus pneumoniae* or pneumococcus of Fraenkel. It is called croupous from the fact that a fibrinous exudate is thrown into the air cells or alveoli, and lobar because an entire lobe or successive lobes of the lung are involved. The pneumococcus is an elliptical or lance-shaped organism which occurs in pairs or in short chains. It is capsulated and stains with the usual dyes; it grows readily on all culture media except potato, but flourishes best on a slightly alkaline medium. The colonies appear as small, round, white or grayish points which do not liquefy gelatin. Fraenkel, in 1884, showed the organism to have a definite and constant relation to pneumonia; but it had been thoroughly studied by other observers previous to that time, notably by Sternberg in 1880. Sternberg found the organism in his own saliva and named it after Pasteur, who also discovered it about the same time. Outside the body the pneumococcus has been found in the dust and sweepings of rooms, and is distributed by dried sputum. Wood found that in sputum kept in a moist state, and not exposed to the sunlight, the pneumococcus might survive nearly two hours; that if powdered sputum is exposed to sunlight, or even diffuse daylight, the germs die in an hour; if kept in the dark, in about four hours. Under ordinary sick-room conditions the pneumococcus becomes harmless in an hour and a half. These observations demonstrate the advantage of ample illumination and ventilation in the sick room. The pneumococcus exists in the normal secretions of the mouth and throat in from 20 to 85 per cent of healthy individuals; but these cocci are not so virulent as those found during an attack of pneumonia or during convalescence. From our knowledge of the behavior of infective germs in the human body it will be seen that any circumstance that lowers the body resistance or that produces a localized congestion, such as exposure to cold, ether anæsthesia, surgical operations, etc., may precipitate an attack of pneumonia. The disease is one of early life; it prevails especially during the winter and early spring; one attack does not confer immunity to subsequent attacks, but rather predisposes to them.

Pneumonia begins with a chill, high fever, and a severe pain in the side, attributable to the accompanying pleurisy. As the malady progresses there is a cough, with a viscid, airless, rusty sputum, later becoming yellow. Respirations are rapid and shallow, 40 or 50 to the minute; the pulse is also rapid, the cheeks are flushed, and the general prostration is extreme. There are in addition headache, sleeplessness, and sometimes delirium. These symptoms continue with more or less severity until the crisis occurs, from the fifth to the eleventh day, when the temperature falls quite suddenly, almost to normal, and rapid improvement sets in. In a few cases a crisis does not occur, but the temperature declines gradually. In fatal cases death takes place from heart failure, owing either to toxæmia or from exhaustion consequent on the effort to force the blood through the obstructed lung; or from suffocation owing to the decrease in the respiratory area. The mor-

ality from pneumonia varies from 15 to 20 per cent. Double pneumonia, in which both lungs are attacked, has a death rate of 50 per cent or more.

During the progress of an attack of pneumonia the affected portion of the lung passes through three stages, each showing characteristic signs, but merging into one another by imperceptible degrees. In the first stage, that of congestion and serous exudation, the lung is denser and darker in color than normal and on section the air cells are seen to be filled with a bloody exudation. The physical signs during this period are diminished expansion, slight dullness on percussion, and, towards the end of the first stage, broncho-vesicular breathing and moist or dry râles. This stage lasts from one to three days and is followed by that of fibrinous exudation or red hepatization. The lung is now red on section, resembling liver, sinks in water, and the air sacs are completely filled with a viscid, fibrinous fluid, mixed with blood corpuscles. Towards the end of the second stage this exudate compresses the capillaries and makes the lung tissue bloodless, so that it presents the condition known as gray hepatization, formerly distinguished as a separate stage of the disease. The physical signs during the second stage are an exaggeration of those of the first. The percussion note is absolutely flat and there are bronchial breathing and bronchophony. (See RESPIRATORY SOUNDS.) The beginning of the third stage, that of resolution, is marked by a true crisis. In a large proportion of cases the temperature drops suddenly to normal within a few hours, and is followed by free sweating and a natural sleep. The physical signs of consolidation gradually disappear, and subcrepitant râles (the so-called *râle redux*) are heard. The exudate filling the alveoli now undergoes liquefaction and is partly absorbed and partly expelled by acts of expectoration. This stage may endure from one to three weeks. Sometimes resolution is delayed, the exuded material undergoes purulent transformation, and single or multiple abscesses of the lung result.

Pneumonia is a self-limited disease, and treatment is therefore not directed towards cutting short an attack, but towards keeping up the patient's strength, supporting the heart, and reducing the temperature. It is particularly in the second stage that the patient is in danger, when the fever is at its height and the heart embarrassed. Alcohol, strychnine, and camphor are the most useful cardiac stimulants, and cold sponging and cold packs or baths the usual methods of reducing the fever. Oxygen may be inhaled when the respiration is embarrassed, but with the modern practice of supplying an abundance of fresh air this is rarely needed. The room temperature should be 65° F or lower. During the past few years excellent results have been obtained by keeping patients in tents or inclosed verandas. The cool air is a stimulant to heart and respiration, and obviates the necessity of drug giving to a great extent. During the third stage expectorants are exhibited to assist in bringing up the exudate, and during convalescence tonics are given to build up the strength and restore the wasted tissues.

Broncho-pneumonia (catarrhal or lobular pneumonia) attacks principally young children and old people by the extension downward of a bronchitis. It often occurs as a complication

of influenza, of the eruptive fevers, especially measles, and of whooping cough. The disease affects the mucous membrane lining the finer bronchial tubes (whence it has been called capillary bronchitis) and the air cells. These become blocked up by a yellowish mucoid material and larger or smaller portions of the lung are deprived of air. The symptoms of this variety of pneumonia are similar to those of the croupous form, except that the temperature rises more gradually and the rapidity of respiration is out of all proportion to the amount of tissue involved. The disease may be acute, sub-acute, or chronic in its course. The treatment is designed, as in croupous pneumonia, to keep up the strength and to assist in the expectoration of the toxic material. A steam kettle is kept going in the sick room, poultices are applied to the chest, and expectorants and a nourishing liquid diet are given throughout the attack.

Chronic interstitial pneumonia (cirrhosis of the lung) is a comparatively rare disease, found in miners, stonecutters, grinders, and others whose occupation necessitates the inhalation of irritating particles. (See PNEUMOCONIOSIS.) It sometimes follows acute pneumonia in which resolution has been delayed, and often terminates as a tuberculous process. There is an overgrowth of the fibrous framework of the lung at the expense of the respiratory elements. The organ shrinks sometimes to half its normal size, and is heavy and tough in consistence. There is always an associated chronic bronchitis, with cough and expectoration. The course of the disease is slow, extending over a period of years. The treatment consists in placing the patient under the best possible hygienic and climatic conditions—a warm climate in winter and a bracing one in summer, with the administration of tonics, such as cod-liver oil, iron, and quinine.

PNOM PENH (*Fr. pron. pnôn' pên'*). The capital of the French Protectorate of Cambodia, 130 miles northwest of Saigon, on the Mekong River (Map: French Indo-China, E 4). The most noteworthy features are the palace of the Buddhist priests, the government buildings, and the pagoda. The town has been considerably improved by the French. The shelling of cotton seeds is an important industry, and the town is also a prominent trade centre. Pop., 39,000.

PNYX, niks (*Lat., from Gk. Πνύξ*). A hill and ancient place of assembly in Athens, the exact location of which, however, is not known. It is usually placed, however, on a hill west of the Areopagus (q.v.). Consult: E. A. Gardner, *Ancient Athens* (New York, 1902); K. Baedeker, *Greece* (4th Eng. ed., Leipzig, 1909); C. H. Weller, *Athens and its Monuments* (New York, 1913).

PO (anciently *Padus* and *Eridanus*). The largest river of Italy, flowing through Piedmont and Lombardy and along the southern borders of Venetia. It rises on Monte Viso, in the Cottian Alps, and flows in a general easterly direction through the great valley between the Alps and the Apennines, emptying into the Adriatic Sea after a course of 390 miles (Map: Italy, C 2). It falls very rapidly in its extreme upper course, its ultimate sources being at a height of 6000 feet. In the lower half of its course, however, it is a comparatively sluggish stream, flowing over a raised alluvial bed so that its surface is higher than the surrounding country and its banks have to be protected by dikes

which extend continuously from Cremona to the delta. These levees, however, do not follow the smaller windings of the river, but cut across peninsulas, which, though unprotected, are cultivated, but are submerged at every considerable rise of the river. The volume of water discharged by the river is nearly equal to that of the Rhine. The greater part is received from the Alps, and nearly one-half comes from the series of large lakes on the south slope of the mountains. The principal tributaries from the left are the Dora Riparia, Dora Baltea, Sesia, the Ticino, the outlet of Lago Maggiore, the Adda from Lago di Como, the Oglio from Lago d'Iseo, and the Mincio from Lago di Garda; from the right the Po receives the Tanaro, Trebbia, Taro, and Panaro. Since the Po is fed exclusively by mountain torrents, the quantity of sediment carried by its current is enormous, the absolute quantity being one-fifth of that carried by the Mississippi or one-fourth that carried by the Ganges. As a result of this the delta of the Po grows rapidly; it advances into the Adriatic by the different distributaries at the rate of 110 to 282 feet a year, and Marinelli estimates that the annual increase is about 174 acres per year. The delta and the surrounding country consist of unhealthful marshes, and there are scarcely any towns on the lower course of the river. The chief cities on its banks are (ascending) Cremona, Piacenza, Casale Monferrato (the head of navigation, 337 miles from the mouth), and Turin. The plain of the Po is of great fertility.

POA, *pō'a*. See MEADOW GRASS.

POACHING, *pōch'ing* (OF. *pocher*, from *pocher*, pocket, probably from Ir. *poc*, Gael. *poca*, pocket, or less probably connected with OF. *pocher*, *pouchier*, to thrust, hit, and ultimately with Eng. *pochard*). In English criminal law, the act of unlawfully trespassing on another's lands for the purpose of killing or taking game, or for the purpose of catching fish. It embraces a variety of statutory offenses, with respect to game and fish, by persons having no sporting rights. These statutes are of great antiquity and were originally enacted in the interests of the landholding classes and for the protection of their hunting privileges. While the modern law still retains many traces of this influence, it is more governed by considerations of game protection in the interest of the general public. Wild animals, including fish as well as game, are not treated by English law as the subjects of larceny, and, but for special legislation, persons taking them from another's lands would be liable only to a civil action for trespass. English game and poaching statutes make such taking a crime. The existing legislation on this topic begins with the Night Poaching Act, 1828, and the Day Poaching Act of 1831. These were called forth by the rapid increase of poaching which followed the close of the Napoleonic wars. Such increase has been ascribed to the distress prevailing in agricultural districts during the third decade of the nineteenth century and to the large number of turbulent spirits thrown out of military employment and cast back into the ranks of ordinary laborers. The acts referred to above made poaching a crime instead of treating it, in its various forms, as an offense which could be condoned by a money penalty.

Poaching Game. By the Poaching Prevention Act, 1862 (25 and 26 Vict., c. 114), which

applies to the United Kingdom and which, as amended by subsequent acts of Parliament, now defines the offense and provides for its punishment, if a constable meet a suspected poacher on the highway, whom he has reason to suspect of coming from land where he has been poaching, such constable may stop and search the poacher; and if game or implements for taking game are found on him, may seize and detain them and summon him before the justices. When before the justices, if it be proved that such game was procured by poaching, or that the implements were used for that purpose, the poacher may be fined in a penalty of £5, besides forfeiture of the game and of guns, nets, and other implements which he may have so used. The person convicted may appeal if he chooses to the next Quarter Sessions, or in certain cases to the Court of King's Bench. Except as provided otherwise, the rule applies that whoever first catches (whether legally or illegally) a wild animal is entitled to the property in it; and as game is in the category of wild animals, the poacher is entitled to keep the game, except where it was caught on private land without permission of the owner or possessor. The game laws have often been described as too severe against poachers, as most of the penalties are cumulative, and the magistrates are usually, as game preservers, inclined to convict.

Poaching Fish. The law of fisheries is not uniform in the United Kingdom. In England and Ireland the general rule is that any one may fish freely in the sea and in all other navigable waters. But there is an exception to this general rule, which consists in this, that as the crown could before Magna Charta (which took away such right) legally grant a several or exclusive fishery in the sea or navigable river to an individual, and as this was, in point of fact, often done, it follows that it is not uncommon to find, even at the present day, an individual, generally the lord of an adjacent manor, claiming a several fishery in public waters. If he can prove that he has exercised this exclusive privilege from beyond the period of legal memory, it will be presumed that it dates from before Magna Charta, and therefore will be legal. When such is the case the public have no right to fish even in a navigable river or the sea at the specified places, the sole fishery being vested in this individual owner. In streams not navigable the rule is that each riparian owner, i.e., the owner of the lands on the bank of the stream, has a right to a several or exclusive fishery up to the middle line of the stream. If he is owner on both sides of the stream, then he has the exclusive fishery in the whole of the stream, so far as his lands extend. As to ponds, whoever is owner of the soil is the owner of a several fishery there, unless he has let it to another. As a general rule there is no such thing as a right in the public to fish anywhere except in a tidal river or the sea, and that is subject to the exception of an individual claiming a several fishery, as before mentioned. It is often supposed that, at all events, if a highway adjoins a private stream, any one passing along the highway may fish in the stream. But this is a mistake. Even where a private stream is subject to navigation by the public, the right to fish in its waters is strictly preserved to the owner.

The general rule as to all several, i.e., exclusive, fisheries is that whoever poaches fish

commits an offense, for which he may be summoned before justices and fined £5 over and above the value of the fish taken; and if the fishery where he poaches adjoins the dwelling house of the owner of the fishery it is a still higher offense, for it is then an indictable misdemeanor. By statute also the fish poacher loses the nets, lines, or other implements employed by him.

The laws of Scotland as to poachers of fish differ in some respects from those of England. In Scotland salmon belongs *prima facie* to the crown, not merely in rivers, but on the sea-coast. Hence the public have no right to fish with nets even in the sea, except by leave of the crown or of the grantee of the crown at the spot in question. Whoever poaches salmon in a river, lake, or within a mile of the seashore incurs a penalty of £5, besides forfeiting the boat, net, or other engine used to catch the fish. While the law is as above stated with respect to fishing salmon with nets, a crown grant is required to enable even a riparian owner to angle for salmon. As regards fish other than salmon the general rule is that the riparian owner may catch all the fish he can, provided he do not interfere with the superior right of some crown grantee of the salmon fishery. A person who poaches trout or other fresh-water fish with a net, or by double rod fishing, or cross-line fishing, or set lines, etc., incurs a penalty of £5, besides forfeiture of the fish caught. And he may be arrested if he is net fishing, but not if he is fishing in another way. In the case of all poachers of trout (except angling poachers, who can neither be arrested nor yet have their fish or fishing rod taken from them by force) the owner of the fishery, or any person authorized by him, may seize the nets, boats, and fishing implements if the poachers are found on the spot.

Poaching is not known as a crime in the United States. The person who without authority kills and carries away game or fish from the land of another is liable to a civil action of trespass on the land, as also for the value of the fish or game so taken, which, by the killing, became the property of the owner of the land. The game laws which have been generally enacted in the interests of the public apply to the taking or killing of game or fish whether on public or on private lands.

Consult Paterson, *Treatise on the Fishing Laws of the United Kingdom* (London, 1873); Sir J. F. Stephen, *History of the Criminal Law of England* (3 vols., 1b., 1883); Woody, *Game Laws of England* (1b., 1896); G. C. Oke, *Game Laws* (4th ed., 1b., 1897). See FISHING, GAME LAWS.

POBEDONOSTSEV, p6-by6'd6-n6s'ts6f, KONSTANTIN PETROVITCH (1827-1907) A Russian statesman, procurator of the Holy Synod. He was born at Moscow, and after distinguishing himself in legal studies at St Petersburg became professor of civil law in the University of Moscow and secretary of the Senate in that city. In 1860 he became tutor of the Imperial princes. In 1872, after holding various important positions, he was named member of the Council of State, and in 1880 procurator of the Holy Synod. Thereafter he virtually directed the ecclesiastical policy of Russia and greatly influenced national politics. As an uncompromising advocate of autocracy and of the Orthodox faith, he was largely responsible for oppressive

legislation. The system of parochial schools which he originated was designed primarily to promote this object. He was one of the most notable authorities on Russian civil law. Besides his important three-volume treatise on this subject, his writings include historical, literary, and biographical studies, besides translations and compilations. The revolutionary movement of 1905 made his position untenable, and he resigned in that year.

PO'CAHONTAS (c.1595-1617). A celebrated Indian princess, daughter of Powhatan (q.v.). She is first mentioned in the *True Relation* (1608) by Capt John Smith (q.v.) as "a child of tenne yeares old, which not only for feature, countenance, and proportion much exceedeth any of the rest of his [Powhatan's] people, but for wit and spirits the non-pareil of his country." She seems to have formed an attachment for the whites, especially for Smith, and to have been a frequent visitor at Jamestown until Smith left in October, 1609, when her visits ceased. In April, 1612, while at the village of her uncle, the King of Potowomek, she was lured aboard an English vessel by Captain Argall and was taken to Jamestown as a hostage for the return of several white prisoners and some stolen property. Here she was converted to Christianity and in April, 1613, was baptized and christened Rebecca. In April, 1614, she was married to John Rolfe (q.v.), with whom, two years later, she went to England, there she was received with great enthusiasm, as the daughter of an American king. Then it was that the celebrated story about her rescue of Captain Smith first appeared. In a letter to the Queen (1616) Smith asserted that in 1607, when he, a captive among the Indians, was about to have his brains knocked out against a large stone, Pocahontas had "hazarded the beating out of her owne braines" to save his, and had on another occasion warned the English of a threatened Indian attack, besides furnishing food to the famishing colonists. It is for this rescue story, much elaborated and embellished by Smith in his *Generall Historie* (1624), which was printed 16 years after the events described therein, that Pocahontas is chiefly remembered. Until Charles Deane attacked it in 1859 it was seldom questioned, but, owing largely to his criticisms, it soon became somewhat discredited. John Fiske, however, in his *Old Virginia and Her Neighbors*, valiantly defends its authenticity. Pocahontas died March 29, 1617, at Gravesend, and was there buried, the following curious entry being made in the parish records "1616 (1617), May 2 j, Rebecca Wrothe wyff of Thomas Wrothe, gent a Virginia lady borne, here was buried in ye chauncell." Pocahontas and Rolfe had one son, Thomas, who, after living for many years in England, migrated to Virginia. From him many prominent Virginia families, including the Bollings (Mrs. Edith Bolling Galt was married to President Woodrow Wilson in 1915), the Murrays, the Guys, the Whittles, the Robertsons, the Elbridges, and that branch of the Randolphs from which sprang John Randolph of Roanoke (q.v.), trace their descent.

Bibliography. For arguments opposing the rescue story, consult Deane's edition of Smith's *True Relation* (1866); E. D. Neill, *Pocahontas and her Companions: A Chapter from the History of the Virginia Company of London* (Albany, 1869); Henry Adams, *Chapters of Erie*

and Other Essays (New York, 1871). For arguments in its favor: Arber, *Smith's Works* (1884); Charles Poindexter, *Capt. John Smith and his Critics* (Richmond, Va., 1893); W. W. Henry, in *Proceedings of the Virginia Historical Society* (ib., 1882); L. G. Tyler, *England in America* (New York, 1904); John Fiske, *Old Virginia and her Neighbours* (2 vols., Boston, 1897; new ed., ib., 1900). B. Smith, *Pocahontas and Captain John Smith* (Boston, 1914).

PO'CATELLO. A city and the county seat of Bannock Co., Idaho, 134 miles north by west of Ogden, Utah, on the Port Neuf River and on the Oregon Short Line (Map: Idaho, F 7). It is a division headquarters of this railroad and has yards and machine shops. Mining, stock raising, and agriculture constitute the leading industries. The city is the seat of the Idaho Technical Institute and contains the Holy Cross School, a Carnegie library, a large Y. M. C. A. building and a splendid high school. Pop., 1900, 4046; 1910, 9110; 1914 (U. S. est.), 11,267.

POCETTI, pò-chèt'tè, BERNARDINO BARBATELLI (1542 or 1549-1612). An Italian painter, born at Florence, where he was a pupil of Ridolfo Ghirlandaio. He enjoyed great reputation as a painter of grotesques, and after his return from Rome, where he had studied the works of Raphael and other masters, executed many mural paintings in Florence (where some are still to be found) and throughout Tuscany. These are notable for landscapes and graceful figures.

PO'CHARD. An Old World sea duck (*Aythya farina*), with a long, broad, and very flat bill, the wings short, and the tail short and rounded. It is smaller than the mallard, but rather larger than the widgeon. The head and neck are bright chestnut, the eyes red. The windpipe of the male, in all the pochards, terminates in a labyrinth composed partly of bone and partly of membrane. It breeds in far northern regions, and in winter migrates southward, even as far as Bengal. It is highly esteemed for the table. The canvasback and the redhead (qq.v.) of the United States are closely allied species. The pochard is also known as dunbird and poker. See DUCK.

POCKET BOROUGH. See BOROUGH.

POCKET GOPHER.

1, the face, showing openings on each side of the cheek pouches; 2, left fore foot, showing great digging claws.

POCKET GOPHER, or **POUCHED GOPHER.** Any gopher (q.v.) of the family Geomyidae,

characterized by their large cheek pouches, which are furry inside and open outside of the mouth. The salamander of the Southern States

SKULL OF POCKET GOPHER.

and the common gopher of the Western prairies are examples. Consult C. H. Merriam, "Monographic Revision of Pocket Gophers," in *North American Fauna*, No. 8 (Washington, 1909).

POCKETKNIVES. See CUTLERY.

POCKET MOUSE. A mouse of the American family Heteromyidae. It has external cheek pouches, lined with fur and opening at the angles of the lips. Several forms live on the arid plains of the western United States and Mexico. The true pocket mice are small, grayish, nocturnal animals, that come out of their burrows only at night to gather seeds and similar provender, which they carry in their cheek pouches into their holes and store there for winter use. Another genus includes the kangaroo rat (q.v.).

POCO, pò'kò (It., little). A term much used in music, as *poco animato*, rather animated; *poco forte*, rather loud; *poco a poco*, by degrees, little by little.

PO'COCKE, EDWARD (1604-91). An English Oriental scholar. His father spelled the name Pocock. He was born at Oxford, where he graduated B.A. from Corpus Christi College in 1622, and in 1629 he took orders. He early turned his attention to Oriental studies and had the best teachers that England could supply. In the Bodleian Library he discovered a manuscript of the Syriac version of the New Testament, containing four epistles (2 Peter, 2 and 3 John, and Jude), which had been missing in the earlier editions, and published them under the title *Versio et Notæ ad Quatuor Epistolas Syriacæ* (Leyden, 1630). While chaplain to the English Turkey merchants at Aleppo (1630-35) he mastered the Arabic language, continued the study of Hebrew, Syriac, Samaritan, and Ethiopic, and collected valuable manuscripts. In 1634, when the plague raged in Aleppo, he remained in the town when others fled to the mountains. In 1636 Pococke was appointed the first professor of a new Arabic lectureship at Oxford; in 1637-41 he was again in the East, especially at Constantinople. During the Civil War and the Commonwealth his connection with Laud and his Royalist sympathies exposed him to much annoyance. His college presented him to the living at Childrey, Berkshire (1642), where his parishioners cheated him and quartered soldiers at the rectory. The revenues of the Arabic lectureship were illegally seized, but by the exertion of John Selden and other friends Pococke was reinstated. He was made professor of Hebrew (1647), with a canonry, of which he was deprived in 1650, while allowed to retain his professorships through the unanimous interposition of all the heads of houses, masters, and

scholars at Oxford. In 1655 a plan to deprive him of his living was defeated through the influence of John Owen and other enlightened men. He published his great work, the *Specimen Historiæ Arabum*, at Oxford in 1649 (2d ed., by Joseph White, 1806). Other works of the same period are the *Porta Mosæ*, an edition of the six prefatory discourses of Maimonides on the Mishna, with Latin translations and notes (1655); the *Contestatio Gemmarum*, a Latin translation of the *Annals* of Eutychius (1658); and a treatise on *The Nature of the Drink Kauhî or Coffee, Described by an Arabian Physician* (1659). He gave much assistance in the preparation of Walton's Polyglot (1657). At the Restoration he was reinstated in his canonry of Christ Church, and thenceforth lived in quiet and ease at Oxford, but busied himself in preparing several works, the most important of which were commentaries on the Minor Prophets. He died Sept. 10, 1691. Pococke's life was written by the Rev. Leonard Twells and prefixed to his edition of *The Theological Works of the Learned Dr. Pococke* (2 vols., London, 1740).

POCOCKE, RICHARD (1704-65). An English clergyman and traveler. He was born at Southampton and graduated at Corpus Christi College, Oxford. In 1725 he became precentor of Lismore and in 1734 vicar-general of the diocese of Waterford and Lismore. The latter appointment was made during his absence, for from 1733 to 1736 he traveled through Europe to Greece. During 1737-42 he journeyed in Egypt and the East, afterward publishing in folio *A Description of the East and of Some Other Countries* (2 vols., 1743-45). This work, dedicated to the Earl of Chesterfield, earned for the author the archdeaconry of Dublin (1755). In 1756 he became Bishop of Ossory. His *Account of Some Antiquities Found in Ireland* was published in the second volume of the *Archæologia* (1773). In 1760 Pococke went as far north as the Orkneys, between April and October traveling 3391 miles on horseback. His *Tours in Scotland, 1747, 1750, 1760*, were edited, with a biographical sketch, by Kemp (1887). Pococke established the Lintown factory in 1763 to further the Irish linen trade, and left a bequest for its maintenance. As Pococke College it is still perpetuated under the Incorporated Society for Promoting English Protestant Schools in Ireland. In 1765 he was transferred to the bishopric of Meath. Accounts of his travels in England, Scotland, and Ireland were republished between 1888 and 1891.

POCO'SIN (a word of Indian origin, also spelled *percoarson*, *percocsin*, *pocoson*, and *poquoson*). A type of vegetation characteristic of eastern North Carolina and almost restricted to that State. (The word is occasionally met in other southeastern States, with slightly different meaning.) A typical North Carolina pocosin is located on level uplands, between streams, and has a permanently saturated, peaty soil overlying sand or sandy loam. There is a rather sparse growth of trees, mostly black pine (*Pinus serotina*), and a dense undergrowth of evergreen shrubs and vines, averaging a few feet in height. Some of the pocosins cover several square miles and have coffee-colored streams running out of them in various directions. They are of little economic value at present, but the peat in them may be utilized at some future time. Descriptions of pocosins can be found in several publications of the

North Carolina Geological Survey, in the report on the agricultural features of North Carolina in volume vi of the Tenth Census, and in some of the government soil surveys of eastern North Carolina counties.

PODAGRA, pò-dàgrà or pòd-à'grà. See GOUT.

PODARGE, pò-dàr'jè (Lat., from Gk. ποδάργη, swift-footed). One of the Harpies (q.v.).

PODBIELSKI, pòd'bè-él'ské, THEOPHIL VON (1814-79). A Prussian general. He was born at Köpenick and entered the army in 1831. Afterward he studied in the Kriegsakademie from 1836 to 1839. He became quartermaster-general of the army in Schleswig and Holstein (1863), held the same post in the war with Austria, after serving as director of the General Department of War (1866), and is best known for his dispatches from the field in the Franco-Prussian War (1870-71), when he was again quartermaster-general. One of his terse messages was "Nichts neues vor Paris." Podbielski was appointed inspector general of artillery after the close of the French campaign. He was the father of Viktor Podbielski.

PODBIELSKI, VIKTOR VON (1844-1916). A German officer and statesman, born at Frankfurt-on-the-Oder, a son of Theophil von Podbielski. In 1862 he joined the Eleventh Lancers. During the Austro-Prussian War of 1866 he served as adjutant of the Sixth Infantry Division and during the Franco-German War on the general staff of the Tenth Army Corps and as major general of the Thirty-fourth Cavalry Brigade. He entered the Reichstag in 1893, and in 1897 succeeded Von Stephan as head of the Imperial postal service. In 1901 he became Prussian Minister of Agriculture. He resigned in 1906 because of revelations concerning his connection with a notorious firm of government contractors.

POD CORN. See MAIZE.

PODEBRAD, pò'dyà-brát, GEORGE (1420-71) King of Bohemia from 1458 to 1471. He was born at Poděbrad in 1420, the son of a Bohemian noble. He adhered to the Moderate party of the Hussites during the reign of Sigismund, but when, on the death of that monarch, the Catholic barons (1438) carried the election of Albert V of Austria (II of Germany), Podebrad allied himself with the Utraquists, who offered the sovereignty of Bohemia to Casimir, brother of Ladislas III, King of Poland. From this time Podebrad's influence gradually increased, and in 1444 he became the leader of the party of Utraquists and later was made administrator of the realm during the minority of the child King, Ladislas Posthumus, the son of Albert. In 1448 he had obtained possession of Prague, and in 1452 was acknowledged Regent by the whole of Bohemia. Ladislas Posthumus died in 1457, and in 1458 Podebrad was chosen his successor. He strove to bring about a peaceful settlement of the religious discussions that had desolated the land, and agreed secretly to lead the country back to the Roman Catholic church. He failed to fulfill this promise, upholding the Utraquists, and was excommunicated by Pope Paul II in 1465. The Catholics of Bohemia were incited to insurrection, and Matthias Corvinus (q.v.), King of Hungary, the son-in-law of Podebrad, was induced to invade Bohemia. The Hungarians were surrounded at Wilimow and forced to cease from hostilities. In spite of the magnanimity shown by Podebrad

on this occasion, Matthias acted falsely towards him, and in 1469 had himself crowned King of Bohemia and Margrave of Moravia. Pödebrad instantly summoned the Bohemian diet, and proposed to the assembled orders that they should take Ladislas, son of Casimir IV, King of Poland, as his successor, while his own sons should merely retain the family possessions. By this means he obtained the Poles for allies; the Emperor Frederick III also declared in his favor, while many of his Catholic subjects were reconciled to him, so that the Hungarians found it advisable to conclude a peace. Pödebrad died March 22, 1471. Consult: Franz Palacky, *Geschichte von Böhmen*, vol. iv (Prague, 1857-60); Max Jordan, *Das Königtum Georgs von Podiebrad* (Leipzig, 1861); Adolph Bachmann, *Böhmen und seine Nachbarländer unter Georg von Podiebrad* (Prague, 1878); C. E. Maurice, *Story of Bohemia* (New York, 1896).

PODESTÀ, pò-dës-tà' (It., power). A term applied to the chief magistrate in the mediæval cities or states of Italy. The office of podestà appears to have been first instituted in the twelfth century, when the Emperor Frederick Barbarossa, having for a brief term reestablished the Imperial authority in Lombardy, placed officers with almost supreme power over the various towns. When the Lombards afterward rose in rebellion against Frederick, the office was abrogated, but it was soon revived by themselves. As the chief cause of the appointment of the podestà was the jealousy that existed between the richer citizens and the nobles, he was usually a citizen of some neighboring state who had formed no entangling alliances. During his term of office he was prohibited from cultivating any intimate connections in the city which he governed. His functions were at first largely judicial. The podestà usually held office for a year only, but occasionally his power became so great that he secured reelection during a succession of years and was the despotic ruler of the city.

PODGORITSA, pód'gó-ré-tsá. A town in Montenegro. See MONTENEGRO.

PODGORZE, pód-gór'zhe. A town in the Crownland of Galicia, Austria, on the right bank of the Vistula, opposite Cracow, with which it is connected by the Franz-Joseph's Bridge. It has brickyards, cement and leather factories, salt works, and a good trade in trimmed lumber and eggs. Pop., 1900, 18,100, mostly Poles, and more than one-third Jews.

PODÍUM (Lat., from Gk. πώδιον, *podion*, little foot, dim. of πούς, *pous*, foot). In classic architecture, (a) an unbroken pedestal course supporting a wall or colonnade, as distinguished from the stepped stylobate of Greek temples; (b) the solid basement or substruction upon which Roman and Pompeian temples were erected, approached by a flight of steps at one end. Hence, in modern usage, any part of a building resembling (a) or (b) in form and serving as a pedestal for an important feature, e.g., the square high base upon which stands the drum of a dome. Like a pedestal, a podium has a base course, die, and cap.

PODMORE, FRANK (1855-1910). An English writer on psychical research, born at Elstree, Hertfordshire. He was educated at Pembroke College, Oxford. From 1879 to 1907 he held a higher division clerkship in the secretary's department of the post office, and from 1882 to 1909 was a member of the council of

the Society for Psychical Research. He was one of the founders and a member of the first executive committee of the Fabian Society, the name of which he probably originated. Podmore adopted a psychological explanation of psychic phenomena. His writings include: *Phantasms of the Living* (2 vols., 1886), with Edmund Gurney and F. W. H. Myers; *Apparitions and Thought Transference* (1894); *Studies in Psychical Research* (1897); *Modern Spiritualism* (1902); *Spiritualism* (1903), with E. W. Cook; *The Naturalization of the Supernatural* (1908); *Mesmerism and Christian Science* (1909); *Telepathic Hallucinations: The New View of Ghosts* (1910); *The Newer Spiritualism* (1910). Consult Henry Holt, *On the Cosmic Relations* (2 vols., New York, 1914).

POD'OCAR'PUS (Neo-Lat., from Gk. πούς, *pous*, foot + καρπός, *karpós*, fruit; so called from the thick stalk which, unlike the case of other conifers, supports the fruit). A genus of trees belonging to the Coniferales and giving name to the family Podocarpaceæ. It includes about 60 species, well distributed throughout the Southern Hemisphere and holding the same geographical and economic position that the pine family (Abietaceæ) holds in the Northern Hemisphere. They are distinguished from members of the pine family in bearing no cones, the solitary ovule (which becomes the seed) being usually conspicuously stalked above the surrounding bracts. The podocarps resemble the pine family in having winged pollen grains, a feature in which these two families differ from the other families of Coniferales. The leaves of *Podocarpus* are often broad, in marked contrast with the needle leaves of pines. Some of the species are valuable timber trees, e.g., *P. cupressina*, of Java and the neighboring islands and the South Sea Islands, a beautiful species 50 to 80 feet tall, with spreading pendulous branches and yellow wood that takes a fine polish. *P. totara*, the totara or totara pine, is the most valuable timber tree of New Zealand, in the southern parts of which country its trunk has been known to attain a diameter of 12 feet. Its wood is superior to Baltic pine in durability and for shipbuilding. The wood of *P. elata*, the gagali of the Fijians, is peculiarly elastic. It abounds in Queensland and New South Wales, where it attains a height of 100 feet and a diameter of from 2 to 3 feet. The timber is free from knots, soft, close-grained, and easily worked, and is much used for cabinet and joiners' work. See DACEYDIUM.

PODOLIA, pò-dó'lyá. A government of southwest Russia, bounded by the Government of Volhynia on the north, Kiev on the east, Kherson and Bessarabia on the south, and the Austrian Crownland of Galicia on the west (Map: Russia, C 5). Area, 16,224 square miles. The region is traversed from northwest to southeast by two ranges of hills separated from each other by the valley of the Bug. The Dnieper flows along the southwestern boundary. The climate is moderate, the annual temperature at Kamen etz-Podolsk, the capital, averaging 48.4°. Podolia has a rich, black soil which yields considerable quantities of grain for export. Besides cereals, tobacco and large quantities of sugar beets for the local sugar mills are raised. The chief products of the house industry are textiles. In 1910 there were in Podolia more than 5000 manufacturing establishments, with about 40,000 employees and an output valued at more

than \$48,000,000. The principal manufactured products are sugar (in the production of which Podolia is exceeded only by the Government of Kiev), spirits, flour, and tobacco. Pop., 1914, 3,955,300, including more than 240,000 Roman Catholics and nearly 400,000 Jews.

POD'OPHYLLIN (from Neo-Lat. *Podophyllum*, from Gk. *πούς*, *pous*, foot + *φύλλον*, *phylon*, leaf; so called because the five or seven divisions of the leaf bore a fancied resemblance to the foot of some animal). The name commonly given to the resin obtained by means of rectified spirit from the root of *Podophyllum peltatum*, or May apple, a plant common throughout the United States. This resin, which occurs as a pale-greenish amorphous powder, has (as well as the root from which it is derived) been introduced into the United States pharmacopœia. It is an active purgative and seems to have the power of relieving the liver by exciting copious bilious discharges. Podophyllin is very soluble in alcohol and moderately so in ether.

POD'OPHYLLUM (Neo-Lat., from Gk. *πούς*, *pous*, foot + *φύλλον*, *phylon*, leaf). A genus of plants of the family Berberidaceæ. *Podophyllum peltatum*, called May apple, mandrake (q.v.), hog apple, and wild lemon, is a common perennial plant in moist woods of North America. Its solitary white flower in the axil of the two leaves is followed by an oval, smooth, yellowish, succulent, mawkishly sweet, subacid fruit, which is not generally considered agreeable. The rootstock has alterative, emetic, and cathartic properties and is of common use in medicine.

POE, EDGAR ALLAN (1809-49). An American poet and prose writer, born in Boston, Jan. 19, 1809. The grandson of a prominent patriot during the War of the Revolution, the son of an actor, David Poe, whose wife (*née* Elizabeth Arnold) was his superior in charm if not in power on the stage, E. A. Poe shared for several years the wandering life and vicissitudes of his parents, but after his mother's early death he was adopted by Mrs. John Allan, the wife of a business man of Richmond, Va. The boy's personality gave promise of fascinating qualities, and he received the best educational opportunities within the reach of his adoptive parents. He was sent to a good school in Richmond; was taken to England in 1815 and placed in the Manor House School in the neighborhood of London, amid surroundings that made a deep impression on his sensitive imagination. In one of his most striking sketches, "William Wilson," he recalled in vivid description the school, the village, and the old church to which the boys were paraded twice on Sunday. In 1820 the Allans returned to Richmond, and Edgar read the classics and studied French under a pedantic Irish teacher, learning with great quickness; he was versatile, fond of reading, somewhat given to satirical comment on his fellows, agile and vigorous in movement and courteous in manner. In 1826 Poe entered the University of Virginia, which had just been established by Thomas Jefferson at Charlottesville on new and promising lines of organization and methods of work. During his course there Poe gave his attention chiefly to Latin, Greek, Spanish, French, and Italian. Heavy drinking and card playing for money were popular forms of dissipation among students, and Poe's life was not wholly free from them. There is, however, no foundation for the reports of excessive indul-

gence on his part; he seems to have been neither better nor worse than many of his contemporaries. At the end of the first session he won honors in Latin and French, but his irregularities offended Mr. Allan, who refused to pay his gambling debts to the sum of \$2500, and Poe was placed in his adoptive father's counting room. The work was very distasteful to him, and he soon made his escape from its drudgery to return to Boston, where his earliest volume, *Tamerlane, and Other Poems*, was brought out by a printer in 1827. The influence of Byron was then at its height, and Poe's work showed how sympathetically he had studied the English poet, whose mastery of the lyric form has given him a foremost place among the singing poets. The verse in the little volume was notable neither for power nor promise of original thought, but it was full of poetic feeling, of sensitiveness to the melody of words, and of rich imagery. In May, 1827, Poe enlisted in the United States army as a private soldier, served two years with fidelity, was honorably discharged, secured a reconciliation with Mr. Allan, and furnished more substantial evidence of his possession of original power by the publication of "Al Aaraaf" and other minor poems in Baltimore in 1829. Mr. Allan married a second time in October, 1830, having previously, by way of settling his wayward ward in life, secured for him an appointment to the Military Academy at West Point. Poe was then 21 years of age, a ready French scholar, had read widely if not wisely, and was a good mathematician. He was, however, neglectful of his military duties, was often under arrest, and at the end of six months was dismissed from the academy by court-martial. He was penniless and could no longer look to Mr. Allan for aid. In March, 1831, another volume from his hand appeared, this time in New York, under the title *Poems*. All the poems save six which had appeared in the previous volume were reprinted, with important changes in several instances, and six additional pieces were given to the public. Among the latter were "The Valley of Unrest," "The City in the Sea," "Lenore," "To Helen," and "Israfel." No poetry of kindred beauty had appeared in America, and in certain respects those remarkable poems have not been surpassed. They showed a wonderfully sensitive ear for verbal notation, a touch so delicate and sure that it may be described as magical, and an imagination at once sombre and beautiful. An artist by temperament and by imitation, Poe had no lessons to teach, no truths to enforce. He cared supremely for beauty for its own sake; and so completely did he master the resources of verse that he was able, by mere collocation of sound, to produce an almost hypnotic effect, to throw a spell over his readers the secret of which resides in the beguiling of the ear quite as much as in the awakening of the imagination.

The poet's activities were thenceforth concentrated on the task of supporting himself with his pen—a task which was rendered exceedingly difficult, not by lack of opportunities or of friends, but by irregularities of life and a restive, sensitive, and capricious temperament. In Baltimore, where he next endeavored to secure a foothold, he found friends and made his first popular success by winning (1833) a prize of \$100 offered for the best prose story by the *Saturday Visitor*, a monthly literary journal.

The story selected by the judges was "A Manuscript Found in a Bottle." Poe was then living with his father's widowed sister, Mrs. Clemm, whose daughter Virginia, then 11 years old, he married two years later. In the meantime Mr. Allan had died without any recognition of his adopted son in his will, and the poet was at last compelled to face life with such resources as nature had given him. These were ample had they been wisely directed and husbanded. He had proved himself a master of lyrical poetry and of the short story, and he was beginning to write criticism of an order new in the United States. He was also drinking too freely on occasion, though how frequently or heavily cannot now be known. In the course of his life, however, it is certain that his abnormally sensitive nervous organization was seriously affected by an indulgence which to men of more vigorous physique would have been of slight importance. The uncertainty of his life, the pronounced strain of melancholy in his temperament, the brooding intensity of his imagination, the weakness of his will, and the terrible strain of his wife's long illness contributed to make him the victim of a habit against which he fought at times with desperate courage and for long periods with success. He was never, except for short periods, what is known as a dissipated man, but strong drink of any kind was a poison to him and the least indulgence prostrated him.

From Baltimore Poe removed to Richmond, which he always regarded as his home and where he found congenial and helpful friends. As editor of the *Southern Literary Messenger* he secured the happiest conditions which he was to know. He was an indefatigable worker, producing stories, poems, and critiques with ease, and at this time with evident pleasure. To this period belong a number of his most characteristic tales of fantasy: "Berenice," "The Fall of the House of Usher," "Ligeia," "Eleonora," "The Masque of the Red Death." These tales were not without forerunners in other literatures, but they combined a quality of imagination, a skill in taking possession of the imagination of the reader, and a perfection of form which have given them a place by themselves in the literature of the world. They close in upon the mind, by a subtle use of suggestion and repetition, until a purely phantasmal world becomes real and abnormal figures take on the semblance of life. The skill with which the transition from the actual to the phantasmal is effected is the supreme triumph of Poe's art in fiction. The men and women who appear in these tales are all phantoms, without warmth, passion, character; they and the realm in which they move are stamped with unreality. Poe's great limitation lies in the narrowness of his range and the lack of deep-rooted vitality in the creatures of his imagination. He deals habitually with abnormal aspects of life and phases of experience. His landscapes, characters, incidents are all in the realm of fantasy. These characteristics relate him to the modern Decadents, whom he has deeply influenced; but he differs widely from the men who have followed his lead in the absolute purity of his thought and imagination.

In 1835 literature of high quality was being produced in the United States, but public taste was uneducated, and crude, sentimental, and cheap fiction was widely read. In the columns of the *Southern Literary Messenger* Poe began

to print criticism of a kind and quality that were new to most American readers. He broke away entirely from the trammels of provincialism in taste and judgment, and applied to current writing the standards of the literature of the world. His handling of *Norman Leslie*, a popular novel of the day, arrested attention by reason of its vigor, its sarcasm, its disclosure of a genuine gift for analysis and appraisal of literary values. The critic, it was evident, was not averse to the use of the keenest weapons, but used them for high purposes. He was bent on exposing literary pretension and on breaking the influence of mediocrity in American letters, and he rendered a genuine service to sound taste and therefore to the development of good literature by his critical work. He lacked the insight and sympathy of critics of the highest class, but he had wide acquaintance with the best in literature, rare power of analysis, and a very delicate sense of form. Above all, he was largely free from provincial prejudices and capable of judging a work of art on its merits. He recognized the genius of Hawthorne at the very start; he was quick to set its full value on Tennyson's early verse; he discerned the significance of Bryant, Lowell, and Cooper. His occasional failure to comprehend the spirit and method of a contemporary was most strikingly shown in his unfortunate attack on Longfellow, whom he accused of plagiarizing.

Poe had many opportunities, but his temperament made it impossible to establish comfortable and permanent working relations. In 1837, when a disastrous financial panic was at its height, he arrived in New York with very ambitious purposes, but with no resources. "The Narrative of Arthur Gordon Pym," published the following year, added nothing to his reputation and little to his income. The autumn of 1838 found Poe in Philadelphia, where he wrote two of his most characteristic pieces, "Silence" and "The Haunted Palace." The poem shows an ethical feeling which no other work from the same hand reveals. Two volumes made up of stories and sketches appeared in 1839 and contained some of the most original work which America has produced.

"The Fall of the House of Usher," "Ligeia," "William Wilson," and "Silence" exhibit Poe's power of invention, vividness of imagination, and skill as an artist at their best; and in perfection of form these prose pieces rank with "Israfel," "To Helen," and "The City in the Sea." To this period belong also those tales of ratiocination which are among the best of their kind and have borne fruit in an abundant harvest of similar or imitative stories. "The Gold Bug," "The Purloined Letter," "The Mystery of Marie Roget," and "The Murders of the Rue Morgue" are on a lower order of imagination than the tales of fantasy, but they are marvelous pieces of invention.

During this period Poe was undergoing the torture of uncertainty with regard to his wife, to whom he was affectionately devoted, and who was continuously and often desperately ill. Under this strain his power of resistance grew weaker, he yielded more easily and frequently to the craving for stimulants, and his unusual power of concentration gradually relaxed.

The position of editor of *Graham's Magazine*, in which he had revealed editorial ability of a high order, was given up or lost, and in 1844

Poe returned to New York with very little money and with a great sorrow impending in the near future. He was still, however, to achieve some of his most striking successes. In 1845 "The Raven," which gave him his immense popular reputation, appeared, and was followed by "The Bells" and "Ulalume." No American poems are more widely known, and in none is his marvelous command of the subtle resources of sound, his magical use of vowels, of repetition, of parallelism, so skillfully used to convey definite and striking effects. His collected poems were published at this time under the title, *The Raven, and Other Poems* (1845), and in the preface to the collection is a piece of autobiography. "Events not to be controlled," he wrote, "have prevented me from making at any time any serious effort in what, under happier circumstances, would have been the field of my choice." Early in 1846 he was living in a cottage at Fordham, near New York. (The "Poe cottage," moved from its original location to a small park, is being preserved as a memorial.) It was here, in January, 1847, that Poe's wife died. The poet, prostrated, was cared for by friends through a long illness, and finally recovered a degree of strength; but he was really a shattered man. He wrote "Eureka: A Prose Poem," marked by his characteristic inventiveness, put the finishing touches on "The Domain of Arnheim," and delivered a few lectures; but both his mind and his will bore traces of his great suffering. In June, 1849, he went to Richmond, where, ill as the result of excesses in Philadelphia, much kindness was shown him and he recovered something of his old spirit. Late in September he set out to return to New York. The story of the next few days never will be clearly told; but on an afternoon in the week following his departure from Richmond he was found in a drinking place in Baltimore, was taken unconscious to a hospital, and died four days later.

Of the three forms of Poe's literary activity his criticism, while of high importance at the time, is of least value; his prose tales have taken their place in the literature of the world by reason of their originality of motive and their finished art; while his poetry remains the most distinctive expression of his genius. In two important studies, "The Poetic Principle" and "The Rationale of Verse," he declared that truth gives expression to the intellect and passion to the heart, while beauty is the language of the soul. Beauty is, therefore, the highest form of creative activity; passion and truth are involved in it, but its chief aim is to produce a definite and convincing impression of its own nature by stimulating the imagination. He defined poetry as "the rhythmical creation of beauty," and laid down the law that beauty is essential to lyrical perfection in the phrase "a long poem does not exist." He held also that a marked quality of metre or rhythm should characterize all verse.

Bibliography. Numerous editions of Poe's work have appeared since his death. That of Griswold (2d ed., 4 vols., New York, 1856) is prefaced by a biography which later writers consider prejudiced to the point of calumny. The biography in the Stoddard edition (6 vols., new ed., New York, 1895) deprecates Griswold's extreme view, but is itself not free from bias. The Diamond edition (Boston, 1874) has a sketch by Gill. Later editions are by Ingram

(2d ed., 4 vols., Edinburgh, 1880; New York, 1894); the Virginia edition by Harrison, with notes by Stewart (17 vols., Boston, 1902), in which are included, in addition to the complete works of the poet, all the obtainable information as to his life and a full bibliography; and the edition by Stedman and Woodberry (10 vols., New York, 1908), scholarly and complete. Poe's *Tales* have been translated into French by Baudelaire and are in his *Œuvres complètes*, vols. v-vii (Paris, 1878-82). There are also German and Spanish translations. The *Poems* have been published in many editions. Of the numerous biographies, S. H. Whitman, *Edgar Allan Poe and his Critics* (New York, 1860), W. F. Gill, *Life of Edgar Allan Poe* (5th ed., ib., 1880), and J. H. Ingram, *Edgar Allan Poe: His Life, Letters, and Opinions* (2d ed., London, 1886), are answers to Griswold's assertions. There are essays by Baudelaire prefixed to volumes v and vi of his *Œuvres complètes*, above mentioned, and by Stedman, in *Poets of America* (New York, 1880). A selection from Poe's correspondence, edited by G. E. Woodberry, appeared in the *Century Magazine*, vol. xxvi (New York, 1894). The best critical *Life* is by Woodberry, in the "American Men of Letters Series" (Boston, 1885). Consult also: id., *Life of Edgar Allan Poe, Personal and Literary* (2 vols., ib., 1909); id., *Edgar Allan Poe*, in "Great American Authors" (ib., 1914); Oliver Leigh, *Edgar Allan Poe, the Man, the Master, and the Martyr* (Chicago, 1906); P. E. More, in *Shelburne Essays*, 1st series (New York, 1907); W. C. Brownell, in *American Prose Masters* (ib., 1909).

POE, ORLANDO METCALFE (1832-95). An American soldier and engineer, born at Navarre, Ohio. Graduating at West Point in 1856, he entered the corps of topographical engineers. In 1861 he served for a time as chief engineer of the Department of Ohio, but later was made colonel of the Second Michigan Volunteers, and in 1862 took part in the Virginia and Maryland campaigns. On November 29 he was made brigadier general of volunteers. The next spring he was transferred to the West as chief engineer of the Central District of Kentucky, and was Burnside's chief engineer during the defense of Knoxville (Nov. 18-Dec. 4, 1863), when he earned the brevet of major in the regular army. In 1864 he was appointed chief engineer of Sherman's army, participating in the invasion of Georgia and the campaign which ended with the surrender of Gen. J. E. Johnston. He received the brevet of brigadier general in the regular army in 1865 and was commissioned colonel of engineers in 1888. After the Civil War for a number of years Poe served as secretary of the United States Board of Lighthouse Commissioners and had charge of the construction of many important river and harbor works, among them the Spectacle Reef and Stannard Rock light-houses and the great lock on the Sault Ste. Marie. See CANAL.

PE'CILE (Lat., from Gk. ποικίλη, *poikilē*, variegated). The name given, because of the paintings that adorned it, to a famous *stoa*, or portico, in Athens, from which the Stoics (q.v.) were named.

POEL, pōl, WILLIAM (1852-). An English actor and theatrical manager, known for his presentations of old plays. A son of William Pole (q.v.), he altered the spelling of his own name. Having adopted the stage as a profession in 1876, five years later at St. George's Hall,

London, he revived *Hamlet*, with the text of the first quarto and without scenery. From 1881 to 1883 he was manager of Royal Victoria Hall, London, and then for a year stage manager of F. R. Benson's company. In 1895 the Elizabethan Stage Society was founded by him. Among the interesting revivals or first presentations under his management may be mentioned Shakespeare's *Measure for Measure* (1893) and *Two Gentlemen of Verona* (1910), plays by Marlowe and Ben Jonson, Milton's *Samson Agonistes* (1900), and Swinburne's *Lochner* (1900). These were given for the most part under the auspices of various societies. Poel also dramatized W. D. Howells's *A Foregone Conclusion* under the title *Priest and Painter* (produced 1884) and Baring-Gould's novel *Mehala* (produced 1886). He wrote several comediettas and a book, *Shakespeare in the Theatre* (1913). Consult C. E. Montagu, *Dramatic Values* (New York, 1911).

POEMA DE JOSÉ. See JOSÉ, POEMA DE.

POENULUS (Lat., the young Carthaginian). A comedy by Plautus, imitated from the *Kapxydovos* of Menander and produced in 189 B.C. The play contains a famous Phœnician passage in Latin characters.

POERIO, pò-a'rè-ò, ALESSANDRO (1802-48). An Italian poet and patriot. With his father, Barone Giuseppe Poerio (1775-1843), and his brother, Carlo Poerio (q.v.), he was exiled to Florence in 1815. Alessandro returned to Naples in 1818 and was one of the defenders of the new constitution. He served as a volunteer under General Pepe against the Austrians in 1821, but was again exiled when the Austrians entered Naples. He then studied in German universities; returned to Naples in 1835; and while again serving under General Pepe against the Austrians in 1848 was mortally wounded near Mestre. He published a number of lyrics, but is best known for his patriotic poem *Il resorgimento*. His verse was published as *Poesie edite e postume di Alessandro Poerio* (1852).

POERIO, CARLO, BARON (1803-67). An Italian patriot, brother of Alessandro Poerio. Born at Naples, he joined the Liberals of that city (1828) and took part in the conspiracy of Avellino, for which he was long in prison. He was concerned in the attempted revolution of 1847, but was discovered, and after the movement at Reggio was sent back to prison. The revolution which broke out at Palermo, Jan. 12, 1848, set him at liberty, and he immediately gave himself to the organization of the famous demonstration of Jan. 27, 1848, which brought about the constitution of February 10. Poerio was nominated director of police and Minister of Public Instruction, but he soon resigned. He was chosen Deputy to the Parliament. In 1849 he was sentenced to 24 years' imprisonment on a charge of conspiracy. In January, 1859, Poerio and other political prisoners were put aboard a vessel for transportation to South America. Transferred to an American ship, which landed them at Cork, they returned, by London, to Turin. In the following year Poerio was elected Deputy from Tuscany and took his seat in Parliament. When Garibaldi (q.v.) had driven out the Bourbon dynasty Poerio returned to Naples. He became a member of the Privy Council and subsequently vice president of the Parliament. He died at Florence.

POETASTER, THE. A comedy by Ben Jonson (1601), attacking Marston and Dekker, to which they retorted with *Satiromastix*.

POET AT THE BREAKFAST TABLE, THE. A series of essays and poems by Oliver Wendell Holmes, contributed to the *Atlantic Monthly* in 1871.

POETICS (Gk. *Περὶ Ποιητικῆς*, *Peri Poitikḗs*). A fragmentary treatise by Aristotle (q.v.) on the philosophy of art and especially of poetry. All we have of it (and possibly all that ever was written) is the discussion of epic poetry and the tragic drama, fortunately enriched with many allusions to the other arts; but, restricted as it is, this treatise is unquestionably the most important work on criticism ever written, intrinsically as well as historically. Consult S. H. Butcher, *Aristotle's Theory of Poetry and Fine Art, with a Critical Text and Translation of the Poetics* (3d ed., New York, 1903).

POET LAUREATE. See LAUREATE, POET.

POETRY. See literatures of the various nations, as ENGLISH, FRENCH, GREEK, ITALIAN, PROVENÇAL, ETC.; also BALLAD; BALLADE, BLANK VERSE; DIDACTIC POETRY; EPIC POETRY, EPIGRAM, LYRIC POETRY; MADRIGAL; MEISTER-SINGER, MINNESINGER, MINSTREL; PASTORAL POETRY; RHYME; SONNET; TROUBADOUR; VERIFICATION. Also individual poems such as BEOWULF; EDDA; MAHABHARATA; NIBELUNGEN-LIED; ROLAND; VEDA.

POETRY, SPASMODIC SCHOOL OF. A name sometimes applied to certain English authors of the nineteenth century whose writings are strained and unnatural in style. Of this class the best known are Philip James Bailey, Alexander Smith, Sydney Dobell, and Gerald Massey (qq.v.).

POETS' CORNER. The popular name given to a part of the south transept of Westminster Abbey containing the tombs and memorials of a number of Englishmen eminent in letters. The memorials include those of Chaucer, Dryden, Milton, Shakespeare, Spenser, Addison, Ben Jonson, Macaulay, Wordsworth, and the American, Henry W. Longfellow.

POEY Y ALOY, pò'á è à-loi', FELIPE (1799-1891). A Cuban naturalist, born in Havana. For a time he practiced law in Madrid. In 1826 he went to Paris, where he studied zoology and aided in founding the Entomological Society of France. In 1833 he returned to Havana and devoted himself to the study of Cuban fauna, particularly fishes, of which he discovered many new species. From 1842 till his death he was professor of comparative anatomy and zoology at the University of Havana. The most important of his publications are: *Memorias sobre la historia natural de la Isla de Cuba* (2 vols., 1851-61); *Reportorio fauno-natural de la Isla de Cuba* (2 vols., 1865-68); *Enumeratio Piscium Cubensium* (1875). His greatest work, *Ictiologia Cubana*, in manuscript at the time of his death, describes 782 species of fish, nearly half which number were made known by him.

POGE, CAPE See CAPE POGE

POGGE, pò'ge, PAUL (1839-84). A German explorer of Africa, born at Ziersdorf in Mecklenburg. In 1874 he joined Alexander von Homeyer's expedition, and in December of 1875 alone reached Musamba, the capital of Muata Jamvo, the farthest point inland reached at that time by an explorer of the German Company. In 1880, with Wissmann, he set out to explore the southern basin of the Congo. They separated at Nyangwe in 1882, and Pogge established a station near Mukenge. He died at Loando just

as he was starting back to Europe. He wrote *Im Reiche des Muata Jemoo* (1880).

POGGENDORFF, pög'gen-dörf, JOHANN CHRISTIAN (1796-1877). A German physicist, chemist, and editor. He was born at Hamburg, studied pharmacy, chemistry, and physics, and was connected with the University of Berlin from 1830 until his death, serving as professor from 1834. In 1838 he became a member of the Berlin Academy of Sciences. His chief discoveries were in connection with electricity and magnetism, but he is best known perhaps for the fact that from 1824 to 1876 he edited the *Annalen der Physik und Chemie*. This journal carried out Poggendorf's original idea, though it was a continuation of (L. W.) Gilbert's *Annalen der Physik*; Poggendorf succeeded to the editorship after Gilbert's death. In connection with Liebig and Wohler he prepared the *Handwörterbuch der Chemie* (Brunswick, 1837-51). He also published the *Lebenslinien zur Geschichte der exakten Wissenschaften* (1853) and *Biographisch-literarisches Handwörterbuch zur Geschichte der exakten Wissenschaften* (2 vols., 1858-63), subsequent editions of which have been issued, the fourth appearing in 1904. The *Geschichte der Physik*, edited by W. Barenten, was published in 1879. Consult Emil Frommel, *Johann Christian Poggendorff* (Berlin, 1877).

POGGIO BRACCIOLINI, pöd'jō brä'chō-lē'nē, GIOVANNI FRANCESCO (1380-1459). An Italian scholar and author of the Renaissance. He was born at Terranuova, near Florence, and after studying Latin under Giovanni da Ravenna and Greek under Manuel Chrysoloras, became a copyist of manuscripts. His skill in that pursuit attracted the attention of the leading Florentine scholars, and at the age of 22 he entered the service of Pope Boniface IX as Apostolic Secretary. He served in the same capacity under the seven succeeding popes (1404-53), attended the Council of Constance in 1414, and was present at the trial and martyrdom of Jerome of Prague, of which he wrote an almost sympathizing account. For the most part, however, he seems to have cared little for the important political and ecclesiastical movements of the period, and is remembered chiefly for his persevering and successful researches in various European monasteries where masterpieces of classic literature were lying unknown. Among the manuscripts he thus recovered were those of Quintilian (complete), the great philosophic poem of Lucretius, *De Rerum Natura*, 7 orations of Cicero, 12 plays of Plautus, the commentaries of Asconius Pedianus, the history of Ammianus Marcellinus, parts of Petronius and of Livy, the *Dialogus* and the *Germania* of Tacitus, the *Silvæ* of Statius, the oration *Pro Cæcina* of Cicero, and the fragment of Suetonius, *De Grammaticis et Rhetoribus*. Among his own works, all of which are in Latin, are a collection of *Letters* (1437); various moral essays, including *De Nobilitate*, *Dialogus* and *De Varietate Fortunæ*; *Historia Florentina*, written in imitation of the style of Livy; and his most famous work, *Liber Facetiarum* (ed. by I. Liseur, Paris, 1878), a collection of violent and often indecent diatribes against the monks and the clergy. The most scurrilous are those against Valla (q.v.) and Filelfo, with whom he was engaged in a long and bitter controversy. His works contain lively descriptions of the life and customs of various European countries and valuable notes on the remains of antique art in Rome. He spent his

last years at Florence, where he was chosen chancellor and historiographer. The material for the collection of French tales *Cent nouvelles nouvelles* (q.v.) was taken in part from the works of Poggio. His statue in the cathedral of Florence is the work of Donatello. Consult: Symonds, *The Renaissance in Italy*, vol. i (London, 1875); J. E. Sandys, *Harvard Lectures on the Revival of Learning* (Cambridge, 1905); id., *A History of Classical Scholarship*, vol. ii (ib., 1908); H. T. Peck, *A History of Classical Philology* (New York, 1911), with the notes; Wilmann, *Ueber die Briefsammlungen des Poggio Bracciolini* (Leipzig, 1913). See RENAISSANCE.

POGO'DIN, MIKHAIL PETROVICH (1800-75). A Slavophile Russian historian and archaeologist. Appointed professor at the Moscow University in 1830, he resigned in 1844 to devote himself to literature and the study of archaeology. His collection of Russian antiquities was bought by the government. He published in 1841-56 a literary and political periodical called the *Moskovite*, in which he advocated Pan Slavism. His efforts in various kinds of literature are now of little importance. Several monographs on special periods of Russian history, with his unfinished *Russian History* (7 vols., 1846-59), which is important for the material gathered, are his chief works of value.

POGO'NIA. See ORCHID.

POGROM, pō-grōm'. The name given anti-Jewish riots in Russia. The first pogroms took place in 1881 after the assassination of Alexander II by the revolutionists, and were organized by a secret society which the officials of the government encouraged, hoping to turn the discontent of the people with political conditions into the channels of race hatred. The pogroms of 1881 were the direct cause of the first large wave of Russian-Jewish emigration to the United States. The policy of organizing such riots was not renewed till 1903, when the massacre of Kishinev in the Province of Bessarabia took place. This was the first demonstration in which blood was shed, about 50 Jews being killed and several hundred wounded. After the manifesto of Oct. 17 (30), 1905, a series of pogroms was organized throughout the Pale of Residence by the counterrevolutionary and reactionary forces; their organized and governmental character has been partially proved by various investigations and by the publication of secret government documents. It is estimated that at this time Jews were attacked in more than 600 cities, villages, and towns; the number of killed, wounded, and tortured was several thousand, while the property damage exceeded 50,000,000 roubles. The Jews were overwhelmed by the calamity, and hundreds of thousands of them left Russia for the United States, South America, Africa, and Palestine. Yet they did not all suffer passively, in many cases organizing leagues for self-defense.

POGY, pō'gi or pōg'i. The menhaden (q.v.).

POHL, pōl, HUGO (1855-1916). A German naval officer, born at Breslau. He became a lieutenant in the navy in 1876, commanded the corvet *Carola* in 1887, was promoted to commander in 1894 and to captain in 1898, and during the bombardment of the Taku forts in China in 1900 commanded the cruiser *Hansa*. He became a commodore in the new navy in 1905 and a vice admiral in 1909. Subsequently Pohl became a full admiral and chief of the admiralty staff, and during the War in Europe (q.v.)

succeeded Admiral von Ingenohl in the command of the German battle fleet (Feb. 27, 1915).

POHL, RICHARD (1828-96). A German writer on music. He was born in Leipzig, studied at Chemnitz and Karlsruhe, at Göttingen and Leipzig, taught in Graz, and then devoted himself to music, living in Dresden (1852-54), in Weimar (1854-63), and in Baden-Baden from 1863 till his death. He edited the *Badeblatt* and (1856-60) *Anregungen für Kunst und Wissenschaft*. His musical critiques, some of which were published under the name *Hoplit*, did much to further the cause of Wagner and Liszt. Pohl's chief works include: *Akustische Briefe* (1853); *Baireuther Erinnerungen* (1877); *Autobiographisches* (1881); *Richard Wagner* (1883); *Franz Liszt* (1883); *Hektor Berlioz* (1884); *Die Höhenzüge der musikalischen Entwicklung* (1888), as well as poems.

POL. A fermented food product made from the starchy root of the taro, *Colocasia antiquorum*. It is very popular in the Hawaiian Islands. It is also the name of a popular Maori action song. See COCCO; TARA; TARO.

POINCARÉ, PWÂN'ká'rá', (JULES) HENRI (1854-1912). A French mathematician and physicist, born at Nancy, April 29, 1854. He entered the Ecole Polytechnique in 1873, but left it two years later to take up work in the Ecole Supérieure des Mines. He became an engineer in 1879 and in the same year doctor of sciences. In 1881 he was called to Paris, where in 1886 he became professor of mathematical physics and calculus of probabilities in the Faculty of Sciences. At the death of Tisserand (1896) he changed this chair for that of celestial mechanics. In 1887 he was made member of the Académie des Sciences at Paris, and in 1908 was elected to the Académie Française. In 1885 he received the Prix Poncelet and in 1889 obtained the prize awarded by King Oscar of Sweden for a work on the problem of the three bodies (q.v.). He received also the Prix Reynaud in 1896, the gold medal of the Royal Astronomical Society in 1900, the Sylvester medal of the Royal Society in 1901, the gold medal of the Lobachevsky Fund in 1904, the Prix Bolyai in 1905, and the gold medal of the Association Française pour l'Avancement des Sciences in 1909. He was a member of most of the great learned societies of the world and was connected with various scientific journals. Poincaré was one of the greatest mathematicians produced by France in the nineteenth century. A disciple of Cauchy, he carried out the investigations of the latter along the various lines of the theory of functions, and he applied his remarkable mathematical powers to profound researches in the domain of physics. He introduced into mathematics a new class of transcendents, analogous to, but more general than, the elliptic functions, which he named the Fuchsian functions in honor of Immanuel Fuchs (q.v.). He introduced also in connection with these functions a new class of groups, also called Fuchsian. He contributed to the theory of non-Euclidean geometry, to the theory of differential equations, and to various branches of higher algebra. Poincaré died in Paris, July 17, 1912. He was a cousin of Raymond Poincaré.

His works include: *Leçons sur la théorie mathématique de la lumière* (2 vols., 1889-92); *Electricité et optique* (2 vols., 1890-91); *Thermodynamique* (ed. by Blondin, 1892); *Leçons sur la théorie de l'élasticité* (ed. by Borel

and Drach, 1892); *Les méthodes nouvelles de la mécanique céleste* (3 vols., 1892-99); *Théorie des tourbillons* (1893); *Les oscillations électriques* (ed. by Maurrain, 1894); *Capillarité* (ed. by Blondin, 1895); *Théorie analytique de la propagation de la chaleur* (ed. by Rouyer and Baire, 1895); *Calcul des probabilités* (ed. by Quiquet, 1896); *Cinématique et mécanismes potentiels et mécanique des fluides* (ed. by Guillet, 1899); *Théorie du potentiel Newtonien* (ed. by Le Roy and Vincent, 1899). Part of these works form his *Cours de physique* (13 vols., 1890). In addition to the foregoing works he published important memoirs on mathematics and physics in the *Journal des mathématiques pures et appliquées*, the *Journal de l'Ecole Polytechnique*, the *Transactions of the Philosophical Society of Cambridge*, *Scientia*, the *Acta Mathematica*, the *Mathematische Annalen*, and many other leading mathematical journals. Consult various biographical sketches in the scientific journals of 1913; also E. E. Slosson, *Major Prophets of To-Day* (Boston, 1914).

POINCARÉ, LUCIEN (ANTOINE) (1862-). A French physicist and educator, brother of Raymond Poincaré. He was born at Bar-le-Duc (Meuse) and was educated there and in Paris at the Ecole Normale Supérieure and the university (D.Sc.). From 1886 to 1893 he taught in lycées, then (as professor) at the Ecole Normale, Sèvres (1894-1900), and in the Faculty of Sciences, Paris (1899-1900). In 1902 he became inspector general of public instruction. Besides contributions to the scientific press Poincaré wrote *La physique moderne, son évolution* (1906; Eng. trans., *The New Physics and its Evolution*, 1907) and *L'Electricité* (1907; Eng. trans., *Electricity Present and Future*, 1908).

POINCARÉ, RAYMOND (1860-). A French statesman and writer. He was born Aug. 20, 1860, in Bar-le-Duc, Lorraine, of a distinguished family of lawyers and scientists, his brother Lucien being a physicist and his cousin Henri the noted mathematician and physicist. Educated early at the lycées of Bar-le-Duc and Louis-le-Grand, he later made a brilliant record as a law student in Paris. For some time he practiced his profession and contributed to political journals, especially the *Voltaire* and the *République Française*. At the age of 27 he was elected to the Chamber of Deputies, where he became a follower of M. Méline, the moderate Republican. During the Dreyfus affair his attitude was not quite clear. Although a staunch Republican, he was opposed to the Radical bloc organized by Waldeck-Rousseau, and particularly opposed to the latter's work in separating church and state. In 1893 he was made Minister of Public Instruction and in 1894 Minister of Finance. Again and again in various ministries he held one office or another, but it was as Minister of Finance that he particularly distinguished himself. In 1903 he was elected to the Senate, where his moderate views were more acceptable than in the Chamber of Deputies. Upon his appointment as Prime Minister in 1912 Poincaré assumed also the portfolio of Foreign Affairs, which department was in a critical condition because of the Morocco affair with Germany. As Premier he became a vigorous supporter of the alliance with Russia and of the entente with England. His ministry also committed itself to electoral reform on the principle, warmly espoused by the

Premier, of proportional representation. Largely through his influence a bill establishing proportional representation passed the Chamber (1912), but was defeated in the Senate.

In January, 1913, M. Poincaré was elected ninth President of the Republic, succeeding Armand Fallières. His election, heralded as a victory for militant nationalism, was particularly pleasing to the Czar, who sent a telegram of warm congratulation. The knowledge that for the first time a really strong man held the presidency of the Third Republic aroused the apprehension of the veteran Republicans, who feared, or pretended to fear, the destruction of the Republic by a coup d'état. M. Poincaré, believing that the President should become "a more trusted and more important magistrate" and not merely a figurehead, made himself the most influential person in the conduct of the government, particularly in foreign affairs. The three-year military service bill (see FRANCE, *History*), introduced by the Barthou ministry in 1913, had the firm support of the President, and in spite of bitter opposition to the measure on the part of Socialists and Radicals it was enacted into law. He was also assiduous in cultivating good relations with Russia and England; on his visits to St. Petersburg and London he was enthusiastically received by the people.

At the outbreak in 1914 of the War of the Nations (see WAR IN EUROPE) M. Poincaré made an impassioned appeal to the Chamber, and war supplies were voted unanimously. The Viviani cabinet, so reorganized as to include representatives of every party, formed, with the President, a sort of committee of public safety. By his brilliant oratory Poincaré was most successful in his efforts to rouse the country to a high and sustained pitch of patriotism. He had become known also as an accomplished writer, and was admitted to the French Academy in 1909. By the students of Glasgow University he was elected lord rector in 1914. His writings include: *Idées contemporaines* (1906); *Questions et figures politiques* (1907); *Causes littéraires et artistiques; Ce que demande la cité* (1912; Eng. trans., *How France is Governed*, 1913), a clear explanation of the organization and activities of the French government. Consult Charles Dawbarn, *Makers of New France* (New York, 1915), and the anonymous *Raymond Poincaré: A Sketch* (ib., 1915); W. M. Fullerton, *Four French Statesmen* (Boston, 1915).

POIN'CIANA. See CÆSALPINIA.

POIN'DEXTER, GEORGE (1779-1853). An American statesman, born in Louisa Co., Va. He began the practice of law in Milton, Va., but in 1802 went to the Mississippi Territory, of which in 1803 he was appointed Attorney-General. In 1806, he was a member of the Territorial Legislature, and the next year he conducted the prosecution of Aaron Burr (q.v.). Then for two terms (1808-12) he was a delegate to the national House of Representatives. In 1813 he was appointed United States judge of the Territory, in 1817 he presided over the committee to prepare a constitution for the State, and, chosen the State's first Representative in Congress, he distinguished himself by his defense of General Jackson's course in Florida. In 1819 he was chosen Governor and while in office prepared *The Revised Code of Law of Mississippi* (1824). In 1830 he was appointed and then elected to fill out an unexpired term as United States Senator. Meanwhile his admira-

tion for General Jackson had cooled, and he was even suspected of complicity in the attempt to assassinate the President. Much to the surprise of his constituents, Poin Dexter voted for Clay's resolution of censure for the President on account of the removal of deposits from the Bank of the United States. In 1835 he was defeated for reelection. Though a man of great ability, he was yet violent, arrogant, and obstinate. As a result of one of his quarrels he killed Abijah Hunt in a duel (1811), in which he was accused of firing before the word, though the charge never was proved.

POINDEXTER, MILES (1868-). An American lawyer and legislator, born in Memphis, Tenn. He was educated at Washington and Lee University, from which he was graduated in law in 1891. He settled in Walla Walla, Wash., where, in 1892, he was elected prosecuting attorney on the Republican ticket, and after moving to Spokane in 1897 he was assistant prosecuting attorney there (1898-1904) and judge of the Superior Court (1904-08). Poin Dexter became widely known as a progressive Republican. In 1908 he was elected to Congress, where he affiliated himself with the insurgents and took a prominent part in the overthrow of Speaker Cannon in 1910. In the latter year he was successful as a candidate in the primary election for United States Senator from Washington—a choice ratified by the Legislature. In 1912 he supported Roosevelt, and for a time was the only representative of the Progressive party in the Senate.

POINDING, pind'ing (from *poind*, Scottish dialectic form of *pound*; connected with AS. *gepyndan*, Eng. *bind*, to shut up, impound, and with *pond*). In Scots law, a method of satisfying a claim, under process of law, by seizing and selling the debtor's goods. Where a creditor has a claim which is considered a lien or burden on land, he may obtain a writ or warrant, known as a *debitum fundi*, authorizing the attachment and sale of such movables (q.v.) or chattels on the land as belong to the debtor. This is called real poinding. Personal poinding, or seizing any other personal goods of a debtor, is authorized by a special writ issued by an inferior judicial officer. Beasts of burden, plow animals, and agricultural implements cannot be seized until all other goods of the debtor are exhausted. The proceedings for the collection of debts above described correspond to the English and American processes of attachment, execution, and distress. See ATTACHMENT; DISTRESS; EXECUTION.

POIN'SETT, JOEL ROBERTS (1779-1851). An American diplomatist and cabinet officer, born in Charleston, S. C. He studied medicine at Edinburgh and military science at Woolwich, and then law, and traveled extensively through Europe and Asia. In 1809 he was sent as United States Commissioner to South America to investigate the chances for independence of the revolting colonies. While he was in Chile the Spanish authorities of Peru, hearing that war had been declared against the United States by Spain, seized American merchantmen, but were forced by Poinsett at the head of Chilean soldiers, who had been put under his command by the Republic, to return them with apologies. While a member of the South Carolina Legislature Poinsett strongly advocated internal improvements. From 1821 to 1825 he sat in the United States Congress as a Fed-

etalist (see **FEDERALISTS**), and urged that assistance be sent to the South American republics. In 1822 he had been sent as special Minister to Mexico, and from 1825 to 1829 was Minister to that country. When the issues of nullification (q.v.) came to the front in South Carolina (1830-32) he became prominent in the Union party and opposed the idea of nullification vigorously. From 1837 to 1841 Secretary of War in Van Buren's cabinet, he secured (in 1840) the passage of the militia reorganization bill. He wrote many orations and essays and founded an academy of fine arts in Charleston. He published *Notes on Mexico, Made in 1822; with an Historical Sketch of the Revolution* (1824).

POINSETTIA. A species of Euphorbia. See **SPURGE**.

POINSOT, EDMOND-ANTOINE. See **HEYLLI**, **GEORGES D'**.

POINSOT, pwān'sō', LOUIS (1777-1859). A French mathematician. He was born in Paris and studied civil engineering at the Ecole Polytechnique in 1794-96. In 1804 he became professor of mathematics at the Lycée Bonaparte, and after 1809 was a member of the faculty of the Ecole Polytechnique. Poinso was a member of the Academy of Sciences, the Superior Council of Public Instruction, and the French Senate, and an Officer of the Legion of Honor. His more important works include *Eléments de statique* (1803; 9th ed., rev., 1848) and *Théorie nouvelle de la rotation des corps* (1834; Eng. trans. by Charles Whitley, *Outlines of a New Theory of Rotatory Motion*, 1834).

POINT. See **HERALDRY**.

POINT. Euclid (q.v.) defined a point as "that which has no part," a definition carelessly modified by Capella (c.475) and some others into "punctum est cuius pars nihil est." Long before this the Pythagoreans had defined a point as a "monad having position." Various other definitions have been given, no one of them being satisfactory, for the reason that the term is too elementary to permit of a good definition. For the historic efforts that have been made to define the term, consult T. L. Heath, *The Thirteen Books of Euclid's Elements*, vol. i (New York, 1908).

POINT BARROW. The northernmost cape of Alaska, in lat. 71° 25' N., long. 156° 20' W. (Map: Alaska, G 1). This is the most northerly inhabited part of the continent of North America and is the land base for whaling in the adjacent Arctic Ocean. It has a post office, a physician, and a school with more than 100 Eskimo pupils. The natives in the neighborhood have reindeer herds numbering about 2000 head. The population, somewhat shifting, averages 500.

POINT D'ALENÇON. See **LACE**.

POINT D'ANGLETERRE. See **LACE**.

POINT D'APPUI, pwān' dāp'pwē' (Fr., point of touch). In military tactics, one of the points previously agreed upon where troops may rally or rendezvous after an extended or scattered movement. In attack formation it may be the point, or points, from which the actual attack is begun.

POINT DE GALLE, pwān de gāl, or **GALLE**. The oldest commercial port of Ceylon, situated at the southwestern end of the island, 56 miles southeast of Colombo (Map: India, D 8). It lies at the foot of a range of rocky hills and is well laid out. The European town, inclosed by fortifications constructed during the Dutch occu-

pation, contains a fine church and many other public buildings. The town has a good harbor, but has lost its former commercial importance. Point de Galle is the seat of a United States consular agency. The town was taken by the Portuguese in 1518 and attained commercial importance on account of the cinnamon monopoly. In 1642 it came into the hands of the Dutch, by whom it was strongly fortified. It passed to Great Britain in 1796. Pop., 1901, 37,326; 1911, 39,960.

POINTE-À-PITRE, pwān'ta'pē'tr'. The principal seaport and largest town of the French West Indian island of Guadeloupe, situated about 20 miles northeast of the capital, Basse-Terre (Map: West Indies, G 3). It is a new town, built on the site of an old town destroyed by earthquake (1843) and by fire (1871), and is surrounded by a marshy district. It has a cathedral and a museum. It exports cocoa, sugar, and vanilla. Pop. (est.), 18,942.

POINTED STYLE. A name used by some writers to designate Gothic architecture (q.v.) in general as distinguished from the preceding Romanesque or round-arched style. The name is based upon the forms of the arches which characterize European medieval architecture from about 1150 to 1500, but as pointed arches are characteristic of most of the Mohammedan styles also, the name has not been generally adopted in place of the more common though unscientific term, Gothic.

POINTER. A dog. See **FIELD DOG**.

POINT LEVI, lā-vē'. A river port in Quebec, Canada. See **LEVIS**.

POINT PLEASANT, BATTLE OF. In American history, a battle fought Oct. 10, 1774, at the mouth of the Great Kanawha River, in Virginia (now West Virginia), between about 1100 Virginians under Andrew Lewis and about 1000 Indians under the Shawnee chief Cornstalk, the former gaining a decisive victory, which closed Lord Dunmore's War. Lewis had arrived at this point on October 6 and had encamped to await the coming of Lord Dunmore, who was to join him with a force of 1000. Early on the tenth, however, Lord Dunmore having appointed another rendezvous, Lewis was preparing to cross the Ohio, when he was suddenly attacked by the Indians. After a fierce contest, lasting all day, each side fighting, Indian fashion, behind trees and boulders, the whites finally won. The battle has been regarded as one of the most stubborn and evenly contested ever fought between Indians and white men. The loss of the whites was 75 killed and 150 severely or slightly wounded, Col. Charles Lewis being among the former. The Indians lost not more than half as many; about 40 warriors were killed outright or died of their wounds. Accounts of the killed and wounded, however, vary greatly. The victory forced the Indians to make a treaty relinquishing to the whites a large tract of land south of the Ohio, while it kept the northwestern tribes relatively quiet during the early part of the Revolution, threw open the Ohio route to Kentucky, and inspired the pioneers with renewed confidence. There is little historic basis for the claim, frequently made, that this should be regarded as the first battle of the Revolutionary War. Consult Theodore Roosevelt, *Winning of the West*, vol. i (new ed., New York, 1900).

POINTS OF THE ESCUTCHEON. See **HERALDRY**.

POIRÉ, pwa'rá', EMMANUEL (1858-1909). A French caricaturist, better known by his pen name, Caran d'Ache (Russian for "pencil"). He was born in Moscow, Russia, and was mainly self-taught in art. His first drawings, military caricatures, mostly of the German army, were published in *La Vie Militaire*, *Le Chat Noir*, and other publications. His *Epopée*, a series of *ombres chinoises* depicting the soldiers of Napoleon, established his reputation. Caran d'Ache is best known, however, for his spirited and amusing "stories without words," illustrating French political and social life. These appeared in *Tout Paris*, *Vie Parisienne*, *Le Figaro*, and *Le Rire*. His drawings have also been gathered in albums, such as *Psst* (1898), which contains his Dreyfus sketches; *Le carnet de chèques*, dealing with the Panama scandals; *Courses dans l'antiquité*; *Les lundi*; *Découverte de la Russie*. His illustrations include those made for *La comédie du jour* of Millaud.

POIRIER, pwa'ryá', PASCAL (1852-). A Canadian legislator and author. He was born at Shediac, New Brunswick, and was educated at St. Joseph's College, Memracook. He was called to the Quebec bar in 1877 and to the New Brunswick bar in 1887. In 1885 he was made a Conservative member of the Dominion Senate. Poirier became a leader and spokesman of the Acadians, the descendants in Nova Scotia and New Brunswick of the French colonists that were not expelled from Acadia in 1755. He was admitted to the French Legion of Honor and was elected a fellow of the Royal Society of Canada. He published: *L'Origine des Acadiens* (1887); *Le Père Lefebvre et l'Acadie* (1891); *Des Acadiens déportés à Boston, en 1775* (1909); *History of the Maritime Provinces from the Acadian Point of View* (1914). See HANNAY, JAMES (1842-1910); NOVA SCOTIA, *History*.

POISON (OF., Fr. *poison*, from Lat. *potio*, drink, potion, from *potare*, to drink). In law, any substance which, if taken or injected into the human body, may cause serious bodily harm or death. In most States the sale of poisons is regulated by statute, especially of such as are known as habit-forming drugs. Common regulations are to require bottles or other receptacles containing poison to be plainly labeled "Poison," in addition to the scientific name of the drug, and to prohibit druggists from retailing certain poisons without physicians' certificates or prescriptions for their use. Physicians may administer poisons as medicines in their discretion. Consult the authorities referred to under CRIMINAL LAW; MEDICAL JURISPRUDENCE; ETC. See ANTIDOTE; CRIME; POISONING.

POISON ALDEE. See SUMAC.

POISONING. The crime of administering poison to a human being or to a domestic animal with intent to cause death or bodily harm. It is a felony in the United States as well as in England to administer or to attempt to administer poison to another with intent to commit serious bodily harm, or to use chloroform, laudanum, or any stupefying or overpowering drug on another with intent to commit an indictable offense. To administer poison to another with intent to injure, aggrieve, or annoy him is usually classed as a misdemeanor. See ABORTION; RAPE.

The use of poison or of poisoned weapons in war is frowned upon by international law (see Hague Regulations, 23 a), but poisonous

gases were freely used in the European War (1914 et seq.). See POISON.

POISONING, ANILINE. See ANILINE POISONING.

POISONING, FORAGE. See MENINGITIS, *Cerebrospinal Meningitis*.

POISON IVY. See IVY; IVY POISONING; SUMAC.

POISON OAK (*Rhus toxicodendron* and *Rhus quercifolia*). American shrubs and vines, feared because of their poisonous qualities, said to be caused by a nonvolatile oil which produces itching, reddening, and swelling of the skin of certain individuals but not of others. Saturated alcoholic solution of lead acetate (sugar of lead) is recommended as an antidote. The fluid extract of *Grindelia robusta* also has some repute for the treatment of poison-ivy poisoning. See IVY; IVY POISONING; SUMAC.

POISON OF SERPENTS. See RATTLE-SNAKE; SNAKE; VIPER.

POISONOUS INSECTS. See INSECT, *Poisonous Insects*.

POISONOUS PLANTS. Plants containing poisonous substances in sufficient amounts to render them injurious when eaten or touched by men or animals. There is, however, no sharp line of distinction between poisonous and non-poisonous plants. Many harmless plants, even some of our most wholesome food plants, like the potato, contain traces of substances which in a concentrated extract are violent poisons. Others, though really harmless unless eaten in immoderate quantities, are or have been popularly reputed to be poisonous. There are, however, a number of plants of which moderate doses are known with certainty to produce injurious or even fatal results. A botanical classification of these would scarcely be convenient, as they are scattered nearly throughout the vegetable kingdom. Yet it is a noticeable fact that certain natural families are especially rich in poisonous members, the active principles of which are characteristic of the family. Thus, nearly all members of Solanaceæ and Papaveraceæ contain narcotic alkaloids; convulsive and cardiac neurotic poisons are characteristic of the Apocynaceæ and Loganiaceæ; prussic acid is frequent in the seeds and foliage of some Rosaceæ; oils and acids producing cutaneous irritation are characteristic of the Anacardiaceæ, Euphorbiaceæ, and Urticaceæ; the Iridaceæ, Liliaceæ, Ranunculaceæ, Leguminosæ, Umbellifereæ, and Cucurbitaceæ are also notable for their poisonous members. The foliage and green parts of many plants, as sorghum, certain beans, cherry, elderberry, currants, etc., contain glucosides that yield hydrocyanic acid, a deadly poison.

The poisonous members of the Anacardiaceæ, such as the poison sumac and poison ivy, are the most important of the plants that are poisonous to the touch; many of the others are poisonous only when eaten. Of these some contain the active principle chiefly in the fruit or seed, such as belladonna, bittersweet, stramonium, poke, henbane, strophanthus, nux vomica, etc.; in others, such as water hemlock and aconite, it is concentrated chiefly in the roots or tubers, though in hemlock, as in many other cases, every part of the plant is almost equally poisonous. In such plants as ailanthus, kalmia, larkspur, and wild cherry, the foliage is especially poisonous and is often fatal to live stock. For further particulars, see the article FUNGI,

EDIBLE AND POISONOUS. Consult: V. K. Chestnut, "Thirty Poisonous Plants of the United States," in *United States Department of Agriculture, Farmers' Bulletin*, No. 86 (Washington, 1898), and L. H. Pammel, *Manual of Poisonous Plants, Chiefly of Eastern North America* (2 vols., Cedar Rapids, 1910-11).

POISONS. See ANTIDOTE, TOXICOLOGY.

POISON SUMAC. See DOGWOOD

POISSON, pwā'sōn', ADOLPHE (1849-). A Canadian poet, born at Gentilly, Province of Quebec, and educated at the Quebec Seminary and at Nicolet College. He studied law and was called to the bar in 1873, and, although he chose literature as a profession, was appointed registrar of Arthabaska County in 1873 and became president of the Provincial Registrars' Association in 1894. He was elected a fellow of the Royal Society of Canada and president of its literary section. His poetical works are: *Chants Canadiens* (1880); *Heures perdues* (1894); *Sous les pins* (1902); *Le sommeil de Montcalm* (1910). Consult Camille Roy, "French-Canadian Literature," in *Canada and its Provinces* (Toronto, 1913-14).

POISSON, JEANNE ANTOINETTE. See POMPADOUR, MARQUISE DE

POISSON, SIMÉON DENIS (1781-1840). A French mathematician, physicist, and astronomer. He early took up the study of the descriptive geometry of Monge. At the age of 17 he entered the polytechnic school at Paris, where he soon attracted the attention of his instructors, notably of Lagrange. He held various positions as examiner and professor in this institution for nearly 40 years. He was also professor of mechanics in the Faculty of Sciences, member of the Bureau of Measures, and member of the Council of Public Instruction (1820). He was made Baron by Napoleon and in 1837 became a peer. His scientific works and memoirs number over 300 and are devoted to mathematics, physics, and astronomy. The work enjoying the widest circulation is his *Traité de mécanique* (2 vols., 1811; 2d ed., 1833; Ger. trans., 1835-36). His other notable works are *Théorie mathématique de la chaleur* (1835; supplement 1837) and *Recherches sur la probabilité des jugements en matière criminelle et en matière civile* (1837). His important memoirs on definite integrals and their applications to physics, on calculus of variations, and on probability were published in *Journal de l'Ecole Polytechnique* (1802-39); *Mémoires de l'Académie* (1811-43); *Connaissance des Temps* (1819-27); and in numerous other journals. Arago's works, volume ii, contain a complete list of Poisson's productions.

POISSON BLEU. See GRAYLING.

POISSY, pwā'sé'. A small town of France, in the Department of Seine-et-Oise, situated 10 miles northwest of Paris (Map: France, N., G 4). It has the fine church of Notre Dame, which is one of the best examples of the transition style of the twelfth century. Poissy is the birthplace of St. Louis (1215), and here in 1561 a famous religious conference was held between Roman Catholics and Protestants. The town has important iron foundries. Pop., 1901, 7506; 1911, 8709.

POITIERS, pwā'tyá'. The capital of the Department of Vienne, and formerly of the Province of Poitou, in west France. It is situated on a plateau-like peninsula formed by the junction of the Clain and the Boivre rivers and on the

Orléans Railroad, 58 miles southwest of Tours (Map: France, N., F 6). It is an old town with narrow, crooked, and ill-paved streets. Although it is a railroad junction, its commerce and industries are not very important; it is interesting chiefly on account of its ancient and mediæval remains and associations. It is preëminently a city of churches and ecclesiastical institutions. The cathedral of St. Pierre is a Gothic-Romanesque structure of the twelfth century. There are several very old and interesting churches, such as the Temple St. Jean, a baptistery built in the seventh century and one of the oldest Christian monuments in France; the church of Notre Dame la Grande, a Romanesque building of the eleventh century; and the church of Ste. Radegonde, founded in 580, rebuilt in the eleventh century. Among the noteworthy buildings and places are the fine modern hôtel de ville and the Parc de Blossac, the latter, situated at the south end of the town, is bordered by mediæval ramparts and commands a fine view. At the north end, near Pont Joubert, is a colossal gilded statue of Notre Dame des Dunes. Poitiers has a university. The municipal library contains 76,500 volumes and 629 manuscripts. There are museums of art, archaeology, and natural history. Pop., 1901, 39,886; 1911, 41,242.

Poitiers was the capital of the Pictones or Pictavi, whence its modern name. The Romans called it Limonum. There are still a number of Gallic and Roman remains in the town and its vicinity. Christianity was introduced in the third century and about 353 St. Hilary became the first Bishop of Poitiers. In the fifth century the town fell into the hands of the Visigoths, whose King, Alaric II, was defeated by Clovis in battle near Poitiers in 507. In 732 Charles Martel checked the advance of the Saracens in the world-famous battle fought in the neighborhood. Near Poitiers, during the Hundred Years' War, the English, under Edward the Black Prince, gained a notable victory over the French under their King, John II, the Good, Sept. 19, 1356. The French, whose forces outnumbered the English more than five to one, opened the battle with a furious charge, but were thrown back by a volley from the English archers, and totally routed by the onset of the English men at arms. The slaughter of French knights was large. King John was taken prisoner. Consult Bélisaire Ledain, *Histoire sommaire de la ville de Poitiers* (Fontenay-la-Comte, 1892). See POITOU.

POITIERS, AGNES OF. See AGNES OF POITIERS.

POITOU, pwā'tō'. A former province of west France, now included within the departments of Vienne, Deux-Sèvres, and Vendée. The capital was Poitiers (q.v.). The ancient inhabitants of the region were the Pictavi or Pictones. It was overrun by the Franks in 507. Charles the Great placed Poitou under the jurisdiction of a count, whose descendants, at the beginning of the tenth century, assumed the title of dukes of Aquitaine. It came into the possession of the English kings through the marriage of Eleanor of Aquitaine with Henry II (q.v.), but was seized by the French King Philip Augustus in 1204. England held it again for about 10 years after the Peace of Breigny (1360), following the battle of Poitiers (1356). In 1416 it was permanently united with the French crown.

POJOAQUE, pò-hwá'ká. See TANOAN STOCK.
POKANOKET, pò'ká-nòk'èt. A North American Indian tribe. See WAMPANOAG.

POKE (*Phytolacca decandra*). A perennial herb of the family Phytolaccaceæ, native of North America, but distributed also in northern Africa, the Azores, and the Hawaiian Islands

FLOWERING STEM AND FRUIT OF POKE.

and China and naturalized in southern Europe. It is often called garget, pigeon berry, and soko, and is found generally in good soil of waste places, as uncultivated fields, often attaining a height of more than 6 feet. See PHYTOLACCA, and Colored Plate of POISONOUS PLANTS.

POKER, or DRAW POKER. A game of cards said to be derived from primero or prime, a favorite English game of the sixteenth century. In France during the following century primero became ambigu, and a little later another variation, called brag, sprang up in the west of England, from which poker is more directly descended in its American form. The game may be played by from two to six persons. A full pack is used and five cards are dealt to each player, one at a time, after which, beginning at the dealer's left, each one may discard any or all of his cards, calling for as many new ones as he discards. This is the draw, and the player holding the most valuable hand is the winner. Beginning with the lowest, the values are as follows: a pair, two pairs, three of a kind (i.e., three cards of the same value), a straight, or five cards in regular order (in determining the value of straights the ace ranks either below the two or above the king, but stands at the end); a flush, i.e., where all five cards are of the same suit; a full house, full hand, or full, which consists of three of a kind and a pair together; four of a kind; a straight flush, in which the cards are in sequence and all of the same suit; and the royal flush, in which the cards of the same suit are the highest in the full pack.

Before the play is opened counters are divided in equal value among the players. These counters usually are disks—called "chips"—of cellu-

loid or some other composition, and of red, white, or blue color, to indicate their value. Before examining a hand each player deposits in the pool a value in counters previously agreed upon. This is the ante. After depositing the ante each player in succession after looking at his hand determines whether or not he will play. If he decides to play he is required to put up double the ante or as much more as he wishes up to the limit agreed on before the game begins. The player at his left has also the choice of staying out or depositing in the pool the same number of chips as the player who preceded him, in which case he is said to see him; or he may raise or go him better, in which case he deposits in the pool more than did his predecessor. The next or third player has also the choice of staying out or raising the preceding player, and so on with each in turn, one or more times around. Should all the players except one fall out, the one who remains takes the pool without showing his hand. Again, all the players in the game may see the one that raised last, in which case they are said to call the player's hand. Should none of the others have a better hand they let the one who has been called take the pool without displaying their own hands, otherwise the higher hands are tabled and the winner takes the pool. It is sometimes agreed that the players who desire cards in the beginning of the game must add to their antes, and sometimes players make bets before they make their draw.

The ante is large or small according as the eldest hand plays; the common method being to require each player to ante twice as much as the eldest hand, who will then have to make good at his next turn the rest of the ante or else fall out of the game. Bluffing is done when a player bets on a weak hand in the hope that the other players, thinking his hand justifies the bet, will stay out of the game and thus leave the pool to him. Aside from bluffing the only part of poker in which skill in the actual playing is requisite is in discarding. Some idea of the strength of a player's hand is got by taking note of the number of cards he calls for. There are many local variations in the value of hands and in the methods of betting.

POKOMOS, pò-kò'mòz. A Bantu nation of the Tana basin, British East Africa, long oppressed by the Galla and the Swaheli. They are of medium height and of light-brown color. Their huts are of beehive shape on raised platforms along the river banks. They are monogamists and are truthful. The Pokomos, in common with many other tribes of this region, are at a low stage of culture, having a loose type of social organization, a well-developed totemic system, and a firm belief in magic.

POKOMOS. A Central American Indian tribe. See MAYA.

POL, pól, VINCENTY (1807-72). A Polish poet, born at Lublin. Educated in a Jesuit college at Tarnopol, he thence went to Lemberg, where he came in touch with French romanticism. After traveling through Poland, in 1830 he became professor of German at Vilna, and in the same year, throwing in his lot with the liberators, wrote his first patriotic songs. Returning from exile in 1849, he was professor of geography at Cracow until 1853. He was forced to resign from this post, but returned to Cracow after several years in Lemberg. In his last years he was totally blind. Pol's most popular work was

Songs of our Land (1843), which deals with the various elements of the Polish population, but his best book is probably *Pictures from Life and Travel* (1847). His genius was essentially lyric and simple, at its best in descriptions of nature or of homely life. His collected works appeared at Lemberg (1875-78).

POLA, pólá. The chief naval station of Austria-Hungary, with one of the finest harbors in Europe, in the Crownland of Istria, on the Adriatic Sea, about 53 miles south of Trieste (Map: Austria, C 4). The bay, which is thoroughly sheltered, is spacious enough to accommodate a very large fleet. The town is strongly fortified by walls and a citadel overlooking the bay. The entrance to the bay is commanded by two forts and by various other fortifications on the islands in the bay and on its shores. Here are the dockyards, dry docks, and repair shops of the Austrian navy, the headquarters of the Admiralty, a hydrographic bureau, and various technical institutions. The town has several very imposing Roman remains, among which are the well-preserved temple of Augustus and Roma, the colossal Imperial amphitheatre, which could seat 25,000 persons, and the Porta Aurea, a sumptuous triumphal arch, dating from the beginning of the Christian era. The Marine Casino and the Monte Zaro, with the fine statue to Admiral Tegetthoff, form a delightful pleasure resort. Pola is an important commercial port. Pop., 1900, 45,052; 1910, 70,145. About 80 per cent are Italians, the rest being mainly Serbo-Croats and Germans.

Pola is of very ancient origin. It was destroyed by Julius Cæsar, but was rebuilt by Augustus at the request of his daughter Julia, from whom it obtained its name, Pietas Julia. It was a station of the naval fleet and bore the name of Republica Polensis. It was taken by the Venetians in the middle of the twelfth century and was destroyed in the struggle between Venice and Genoa. Its prosperity dates from about 1855. During the war which began in 1914 Pola was bombarded by the allied naval forces. See WAR IN EUROPE.

POLAC'CA. See POLONAISE.

POLAC'CO, GIORGIO (1875-). An Italian orchestral conductor, born at Venice. Having completed his musical studies at the conservatories of St. Petersburg, Venice, and Milan, he began his career as assistant conductor at Covent Garden. Then he directed for several seasons the Italian Opera at Rio de Janeiro and Buenos Aires. After his return to Italy he occupied the conductor's chair in the opera houses of Genoa, Florence, Rome, and especially Milan, where, besides the great Wagnerian works, all the French and Italian novelties were intrusted to him. In 1912 he was engaged as one of the conductors of the Metropolitan Opera House in New York. Here his opportunity came when in the spring of 1915 Toscanini, the principal conductor, was taken ill and Polacco directed the former's repertory for the rest of the season. Upon Toscanini's resignation Polacco succeeded him as principal conductor in the fall of the same year.

POLAK, pólák. See POLAND, *Ethnology*.

POLAND, pólánd. A former kingdom of Europe, whose territory was distributed (down to 1914) between Russia, Austria-Hungary, and Prussia. At its greatest extent, previous to 1660, it had an area of some 375,000 square miles, with a population of about 15,000,000,

and extended northward to the Baltic Sea and the Gulf of Riga, westward to Brandenburg, southward to Hungary, Moldavia, and nearly to the Crimea, and eastward so as to include most of the basin of the Dnieper. At the outbreak of the European War in 1914, about six-sevenths of this area was included in the Russian Empire, embracing Russian Poland (see POLAND, RUSSIAN), West Russia (Lithuania, Volhynia, etc.), a great part of Little Russia, Livonia, and Courland. The part of Poland which belonged to Austria constituted the Crownland of Galicia (q.v.). The parts of the Kingdom incorporated in Prussia included Posen (q.v.), West Prussia (q.v.), and the District of Ermland (q.v.) in East Prussia. Before its final partition in 1795 the area of Poland was reduced to 94,164 square miles, with a population of 4,500,000.

Ethnology. The territory comprised in the Kingdom of Poland before its dismemberment was inhabited by four ethnic types, Poles, Little Russians (Ruthenians), White Russians, and Lithuanians. The Poles proper have been identified with the Polianes, a branch of the Lekhs dwelling on the Vistula in the sixth century. The great Slav movement from the second to the sixth century A.D. had dispersed the tribes in all directions, towards the Baltic, beyond the Elbe, and into the Danube basin and the Balkan Peninsula. By the twelfth century the Germans had in a great measure pressed back the Western Slavs to the banks of the Vistula, and the development of Polish power was forced to the east and south among the Slav groups.

Ethnically the Poles belong to the Western Slav group. The bulk of them live in Russian Poland and adjoining parts of Russia, western Galicia, and the Prussian provinces of Posen and Silesia. They are below medium stature, their average height being 1.624 meters, and are mainly brachycephalic and blond. Deniker classes them in his fair, subbrachycephalic, short, or Eastern race, and sees among them traces of a secondary or Vistulian race, fair, mesocephalic, and of very short stature. Race fusion has energetically acted in this region among various sections of the Slavs, so that the Poles have the qualities coming from a good race mixture. Other Slavic tribes, as the Polaks or Podlachians in the Russian Government of Grodno, on the Polish frontier, and the Polesians of Western Russia have considerable Polish mixture. In Prussia, by the higher birth rate and by the absorption of German elements, the Poles have increased remarkably, notably in West Prussia and Silesia. The other fragments of the Polish Kingdom in Russia and Austria also show this tendency, though not with the same degree of progress as in Prussia.

History. Polish historians profess to go as far back as the fourth century, but the history of Poland previous to the middle of the tenth century is too legendary to have much value. About 840 a kingdom is said to have been organized out of kindred tribes under the Piast line of rulers, whose origin is uncertain. Ziemovit, said to be the second ruler of the Piast dynasty, is considered to be the first ruler whose history is to any extent to be relied upon; and it was not till a century after, when his descendant Miecyslaw (Miecislas or Mscislaw) I (962-992) occupied the throne and became a convert to Christianity, that Poland really came into the field of European history. Miecyslaw divided his dominions among his sons; but one of them,

Boleslaw (or Boleslas) I (992-1026), surnamed the Brave, soon reunited the separate portions, extended his Kingdom beyond the Oder, the Carpathians, and the Dniester, and carried on a successful war with the Emperor Henry II. About the same time the distinction between the nobles or warrior class and the agriculturists was distinctly drawn. This was of the utmost importance in the development of Poland, as it created a sharply defined caste, a military aristocracy, which became ultimately one of the most arrogant and oppressive in Europe. An important event was the foundation of the archiepiscopal see of Gnesen about 1000. Shortly before his death Boleslaw exchanged the title of Piast for King. He was succeeded by his son Mieczyslaw II (1026-34), during whose reign the Danes, the Hungarians, and the Russians made themselves masters of various territories which had been occupied by the Poles. Under Casimir I (1040-58) and his warlike son, Boleslaw II the Bold (1058-81), Poland regained something of its former power. The latter monarch having with his own hands murdered the Bishop of Cracow (1079), the country was laid under the papal interdict, and Boleslaw fled to Hungary, where he died. Boleslaw III (1102-39), an energetic monarch, conquered Pomerania, defeated the pagan Prussians, and defended Silesia against the Emperor Henry V. A division of the Kingdom among his sons was productive of much internal dissension. Silesia was severed from Poland, principalities ruled by branches of the Piast dynasty being established there. Ultimately Casimir II (1178-94) reunited the severed portions, with the exception of Silesia, and established on a firm footing the constitution of the country. A senate was formed from the bishops, palatines, and castellans, and the rights of the clergy and the peasantry were accurately defined.

Soon after Casimir's death Pomerania emancipated itself from Polish rule. In the thirteenth century the Teutonic Knights subdued the heathen Prussians and established their dominion on the shores of the Baltic, becoming formidable neighbors to the Poles. The Mongols swept over the Polish territories in 1240 and defeated the Poles, Silesians, and Teutonic Knights in the battle of Liegnitz (April 9, 1241). As a result of this invasion, Poland was divided into a number of independent principalities, and their dissensions led to the loss of large districts. During this period many parts of the country began to be colonized by Germans, who did much for Poland by establishing industries and developing municipal institutions. Large numbers of Jews, persecuted in western Europe, took refuge about this time in Poland. The country recovered under Ladislas (Wladislaw) I (1306-33), who abolished judicial abuses and illegally acquired privileges and assembled the first Diet for legislative purposes. He carried on successful campaigns against the Teutonic Knights, supported by the Grand Prince of Lithuania, and came to be known as the father of his country. Under him Cracow became the permanent capital of Poland. His son, Casimir III the Great (1333-70), increased the power and prosperity of Poland by cultivating the arts of peace, amending the laws, and consolidating his territories by profitable exchanges with the neighboring Powers. The Principality of Halicz (Galicia) was annexed to Poland. Extensive privileges were conferred on the Jews at a time

when the nations of western Europe were visiting on them the rigor of persecution. The foundations of the University of Cracow were laid. In the latter part of his reign Casimir fought successfully against the Tatars and Lithuanians. With Casimir the Piast dynasty became extinct. His nephew, Louis the Great, King of Hungary, succeeded him by the will of the deceased monarch and the election of the Diet; but during his reign Poland was treated merely as an appanage of Hungary. After the death of Louis of Hungary without male issue (1382) Jadwiga or Hedwig, daughter of Louis the Great, was chosen Queen of Poland (c.1384) by the Diet, and two years later she married Jagello (Jagellon), Grand Prince of Lithuania, who ascended the throne as Ladislas II (q.v.) and founded the Jagellon dynasty, which ruled over Poland and Lithuania from 1386 to 1572 and under which Poland was at the height of its greatness. Jagello at his accession embraced Christianity, which was now introduced into Lithuania, hitherto a heathen country. Jagello inflicted a great defeat upon the Teutonic Knights at Tannenberg in 1410. He was succeeded in Poland by his elder son, Ladislas III (1434-44), and in Lithuania by his younger son, Casimir. Ladislas, whom the Hungarians placed upon their throne, was overwhelmed by the Turks and slain in the battle of Varna. He was succeeded after an interregnum by his brother, Casimir IV (1447-92), during whose reign the Teutonic Knights, by the Treaty of Thorn (1466), ceded West Prussia to Poland and agreed to hold East Prussia as a Polish fief. Casimir rewarded the inferior nobles, or warrior class, with more extensive privileges, putting them on an equality of rank with the great chiefs of the realm and at the same time necessarily oppressing the peasantry. Manufactures and commerce revived to a remarkable extent in the Western provinces. The brief reigns of his two elder sons, John I (1492-1501) and Alexander (1501-06), were marked only by the increased power of the Diet, which was steadily absorbing the real authority and converting Poland from a monarchy to an oligarchy.

Sigismund I, surnamed the Great (1506-48), the youngest son of Casimir IV, raised the country to the utmost pitch of prosperity. Generous and enlightened, he was beloved by the masses, while his firmness and justice commanded the respect of the turbulent nobles. In a war with Russia, however, in the early part of his reign, he lost Smolensk. His son Sigismund II Augustus (1548-72) was a worthy successor to his father. During his reign the extraordinary privileges of the higher nobles were curtailed or abolished. Lithuania was finally joined indissolubly to Poland, the union being proclaimed by a Diet held at Lublin in 1549. There was but one Diet for the united realm, which was to be converted into an elective monarchy on the death of the reigning King, who had no heirs. Lithuania retained, however, her own army, treasury, and laws. Lithuania was at the same time reduced in area by the annexation of Podlachia, Volhynia, and the Ukraine to Poland. Livonia was ceded to Poland by the Knights Sword Bearers, and successful wars were waged against the Russians and the Turks. The Polish realm then stretched across central Europe from the Baltic Sea to the Dniester, with its western boundary less than 90 miles from Berlin and its eastern frontier about 150 miles from Moscow,

covering an area of more than 370,000 square miles. The population almost doubled under the two Sigismunds. The Reformation spread rapidly in Poland, but its progress was arrested by the Jesuits, who persuaded the nobles that their interests lay in the preservation of the Catholic hierarchy. With the death of Sigismund Augustus, in 1572, the Jagellon dynasty became extinct, and Poland passed under the régime of elected kings. The election was by the two chambers of the Diet—the Senate, or Chamber of the Chief Nobles, and the Chamber of Nuncios, or Representatives of the Inferior Nobles. The Diet sat only six weeks, and its decisions were required to be unanimous, so that, if the *liberum veto* (the right of forbidding the passing of any measure) were freely exercised even by a single member, all legislation was at a standstill. More unnatural still was the recognized right of any number of nobles to confederate for the purpose of effecting their will by force of arms.

This singular constitution produced the most inefficient government that was ever established in a great state. The first elective monarch was Henry of Valois, Duke of Anjou (1573–74), who had barely assumed the crown when he laid it down to become King of France as Henry III and was succeeded by Stephen Báthory (1575–86), Voivode of Transylvania. Stephen's successor, Sigismund III Vasa (1587–1632), was the son of John III of Sweden by a daughter of Sigismund I. His claims to the crown of Sweden, which he wore for a time, brought on wars with that Kingdom. Gustavus Adolphus carried on victorious campaigns against the Poles in 1621–29 and conquered Livonia. The imprudent attempts of the sovereigns of the house of Vasa to amend the constitution only excited the suspicion of the nobles and led to a further curtailment of royal authority. In 1648 the Cossacks, goaded by oppression, rose in rebellion under Bogdan Chmielnicki (q.v.), put themselves under the protection of Russia (1654), and ever afterward proved themselves the most inveterate enemies of the Poles. In 1655 Charles X of Sweden invaded Poland while the Poles were engaged in war with Russia, and in 1656 he was joined by Frederick William, the Great Elector of Brandenburg. The Poles were vanquished in a great battle at Warsaw in July, 1656. In 1657 Brandenburg went over to the side of Poland, which then renounced its suzerainty over the Duchy of Prussia (East Prussia). In the Peace of Oliva, in 1660, Poland formally ceded Livonia to Russia, and the Ukraine beyond the Dnieper was given up to Russia in the Treaty of Andrussovo in 1667. In 1674 the crown was conferred on John Sobieski, who shed lustre on the Polish arms by overthrowing, in conjunction with the German princes, a vast Turkish army in front of Vienna in 1683 and saving the Hapsburg capital. His reign, however, was productive of little good to the internal administration. He died in 1696, and the French Prince de Conti was elected and proclaimed King. Lacking efficient support from France, Conti renounced the office; and Frederick Augustus I of Saxony, surnamed the Strong, a protégé of the house of Austria, entered Poland at the head of a Saxon army and was chosen King as Augustus II (1697–1733). The Treaty of Karlowitz, in 1699, brought the last struggle between Poland and Turkey to a close and restored to Poland a large part of the

Ukraine. In 1700 Augustus entered into an alliance with Russia and Denmark for a joint attack upon Sweden, then under the rule of Charles XII. The war with Sweden was unpopular in Poland; in fact, the Poles of the Eastern provinces received Charles with open arms; but his attempt to force upon them Stanislas Leszczynski as their King deeply wounded their national pride. At Altranstädt in 1706 Augustus was compelled to abdicate, but after the defeat of Charles XII by Peter the Great at Poltava in 1709, he returned, supported by Russia and Saxony.

This beginning of Russian interference was a visible mark of the decline of Poland. Protestants were persecuted and excluded from public office. The election of Augustus III (1733–63) was accomplished by the most shameless bribery and under the compulsion of Russian troops and led to the War of the Polish Succession. (See SUCCESSION WARS.) His reign was of the same character as that of his predecessor. Towards its close the more enlightened of the Poles entered into a league to promote the establishment of a well-organized hereditary monarchy. But the conservative or republican party was equally strong and relied on Russian influence, which was used to continue the divisions in the country. Catharine II of Russia determined at the beginning of her reign to control Poland or take it, as it barred the way to the accomplishment of her great ambition, to bring Russia fully into the circle of the Western Powers. On the death of Augustus III she, acting in harmony with Frederick of Prussia, put forward as a candidate for the Polish throne Stanislas (Augustus) Poniatowski, an old lover of her own. This roused the national spirit of the Poles to intense opposition. The monarchic party, led by Prince Czartoryski, had succeeded in abolishing the *liberum veto* and in otherwise strengthening the government. Catharine, in alliance with Prussia, seized the pretext furnished by the oppression of religious dissidents of the Protestant and Greek communions by this dominant party and appeared as the champion of religious liberty. Russian troops entered the country and forced the election of Poniatowski (1764). Confederations were organized to resist Russia, and Turkey seized the occasion to attack that Power. To avoid the danger of a general war and to obtain compensation for the inevitable seizure of Polish territory by Russia, the governments of Prussia and Austria proposed a treaty of partition, which was concluded at St. Petersburg, Aug. 5, 1772. Russia acquired a part of the old Lithuania, comprising an area of 42,000 square miles, with a population of 1,800,000; Prussia took West Prussia without Danzig and Thorn, and the district on the Netze, 13,000 square miles, with 415,000 inhabitants; and Austria received Galicia and Lodomeria, 27,000 square miles, with 2,700,000 inhabitants.

Members of the Polish Diet were freely bribed to consent to the cessions. The old anarchical constitution with the *liberum veto* was restored. The country was now aroused to a sense of its danger, and the result was the adoption of the admirable constitution of 1791, which gave political rights to the cities, civil rights to the peasantry, and rendered the kingly authority hereditary. Frederick William of Prussia promised the Polish patriots support against Russia. Catharine II, however, by intrigues and bribery won a small number of the higher Polish no-

bility, who formed the Confederacy of Targovitz (May, 1792) and protested against the new constitution as derogatory to the ancient liberties. Catharine, thus armed with a pretext for interference, invaded Poland with an overwhelming army. The Poles fought bravely under Kosciuszko (q.v.) and won a victory over the Russians at Dubienka (July 17, 1792); but King Stanislas, after pledging his loyal support to the nation, gave his adhesion to the Confederacy of Targovitz. A Prussian army now entered Poland, and the country, its strength broken, was subjected to a second partition (July 17, 1793). Russia took a large part of Lithuania, half of Volhynia, Podolia, and the portion of the Ukraine which had remained with Poland—96,000 square miles, with about 3,000,000 inhabitants. Prussia appropriated the westernmost part of the Kingdom—22,000 square miles, with 1,100,000 inhabitants. A Diet convened at Grodno was compelled to sanction this "cession." A general rising of the Polish people to resist this dismemberment of their country took place in 1794. Kosciuszko was made Dictator and drove the Russians from Warsaw, but dissension among the Poles ruined their cause at the moment of seeming triumph. The Russians and Prussians reentered the country with increased numbers, and on Oct. 10, 1794, Kosciuszko was decisively defeated and taken prisoner at Maciejowice by the Russians. On November 8 Suvarov entered Warsaw, and Polish resistance came to an end. The third and last partition (Oct. 24, 1795) distributed the remainder of the country, Russia taking 45,000 square miles, with 1,200,000 inhabitants; Prussia, 21,000 square miles (including the capital, Warsaw), with 1,000,000 inhabitants; and Austria, 18,000 square miles, with 1,000,000 inhabitants. King Stanislas resigned his crown and died at Grodno as a pensioner of Russia in 1798. Napoleon, who promised the restoration of Poland and thereby gained the support of the patriots, was hailed with satisfaction, but all that Napoleon accomplished was the establishment, by the Treaty of Tilsit (1807), of the Duchy of Warsaw, formed out of the Polish territories taken by Prussia in 1793 and 1795. This state received a fairly liberal constitution, and King Frederick Augustus of Saxony as its nominal head, the real power being exercised by the French Emperor. The duchy was increased by western Galicia, ceded by Austria in the Treaty of Schönbrunn in 1809. The Poles furnished a considerable contingent to the French armies. The disaster to the French in Russia in 1812 and the advance of the allied army in 1813 put an end to the existence of the duchy. The partition of Poland was rearranged by the Congress of Vienna in 1815. Prussia retained West Prussia and recovered the western portion of the territory embraced in the Duchy of Warsaw, which region was constituted into the Grand Duchy of Posen; Austria recovered the territory which she had taken in the first partition of Poland in 1772 (Galicia), Russia was secured in the possession of all the territories that she had appropriated in the three partitions; out of the bulk of the Duchy of Warsaw was created a new Kingdom of Poland, which was to be united with the Russian Empire by a personal union. The city of Cracow, with a small surrounding territory, was erected into a republic, which was placed under the protection of the Great Powers. This final partition of Poland gave

Russia 220,500 square miles, Prussia 26,000 square miles, Austria 35,500 square miles. Of the portion which was to belong to the Emperor of Russia, about 49,000 square miles were included in the new Kingdom of Poland.

Alexander I of Russia first granted a liberal constitution, a separate standing army, and liberty of the press. Secret societies, as elsewhere in Europe, fomented a revolt, and a general insurrection of the people, headed by the aristocracy, took place. On Nov. 29, 1830, a military insurrection broke out at Warsaw, and in a short time the Russians were driven from the country. The leadership of the movement was assumed by a number of nobles, most prominent of whom was Prince Adam Czartoryski (q.v.). Chlopicki (q.v.) was appointed Dictator. In January, 1831, the independence of Poland was proclaimed, and Czartoryski was made head of the national government, Chlopicki having laid down his dictatorship. A Russian army under Diebitch invaded the country. The Poles fought with their wonted bravery and for months kept the enemy at bay, but their main army, under Skrzynecki, was defeated at Ostrolenka on May 26. Warsaw was taken by the Russians on September 8, and the Polish armies sought refuge on Prussian and Austrian soil.

There followed for those who had participated in the rebellion imprisonment, banishment, confiscation, and enforced service in the Russian army. From this time all self-government in Poland was suppressed. The liberal constitution of 1815 and laws were abrogated; strict censorship of the press and the Russian spy police system were established in all their vigor, the country was robbed of its rich literary collections and works of art; and the most severe and arbitrary measures were taken to Russianize the people. Large numbers of Poles were forced to take refuge in France and elsewhere, where they carried on an active revolutionary propaganda, and some of them played an important part in the struggle for liberty in other countries. (See BEM, DEMBINSKI.) The year 1846 witnessed another effort on the part of the Poles to shake off the yoke that had been imposed upon them. The movement did not proceed far. In Prussian Poland (Posen) it was promptly checked by the arrest of Mieroslawski (q.v.) and other leaders, while in Galicia the peasantry (in great part Ruthenians) rose against the nobles, the leaders in the outbreak, and massacred many of them. In the same year the Republic of Cracow was incorporated with Austria. In 1848 there was an insurrection in Posen, which was quickly suppressed. After the accession of Alexander II of Russia in 1855, the condition of the Poles was considerably ameliorated, and an act of amnesty brought back many of the expatriated Poles.

The Czar evinced by his acts his readiness to make far-reaching concessions to his Polish subjects, but in spite of this there were violent revolutionary demonstrations in 1861, which were repressed with bloodshed. In 1862 a régime of partial autonomy was inaugurated under the guidance of Marquis Wielopolski, a member of the Polish aristocracy; but the Russian government was not trusted by the Poles, and a revolutionary fever had taken hold of the youth, which found vent in fresh outbreaks and in attempts to assassinate the Viceroy Constantine (brother of the Czar) and Wielopolski himself. The Russian government proceeded to stern repressive measures, and in January, 1863, re-

sorted to a barbarous expedient in order to quell the revolutionary spirit—a wholesale conscription, suddenly executed, which should at one stroke remove the patriotic young men from the field of their activity. This measure, which could be but partially carried out, brought matters to a crisis, and the country rose in insurrection. This movement differed from the preceding uprisings in that it was largely a democratic agitation and was carried on under the guidance of a secret revolutionary committee. This body issued its first proclamation in February, 1863, and a week afterward Mieroslawski raised the standard of insurrection on the Posen frontier. The principal commander of the patriots was Langiewicz. It was little more than a mere guerrilla war, and no great or decisive conflicts took place. The sympathy of Europe was largely enlisted on behalf of the Poles, but the remonstrances of the Powers were wholly disregarded by the Czar's ministers. The Poles fought heroically against desperate odds. The national committee continued to guide the revolt and resorted to terrorism, even assassination, to carry out its measures and enforce obedience. The overwhelming numbers of the Russians soon carried everything before them, and early in 1864 the last sparks of the insurrection were stamped out. Large numbers of the patriots were executed, and many were transported to Siberia. Lithuania and other parts of old Poland, not included in the so-called Kingdom, were at once subjected to a process of Russification, which was carried out with extraordinary barbarity. By an Imperial ukase of Feb. 23, 1868, the government of Poland was completely incorporated with that of Russia.

After the insurrection of 1863 Russia began a systematic campaign for the Russification of Poland. By special laws passed in 1868 and 1869 Russian was made not only the official language of Poland, but the language of the high schools in which the Polish youth was to receive its education. In 1871 the Russian language began to be introduced into the elementary schools, and by 1885 Russian had become the language in which all subjects were taught in all schools. The Russian government did not stop there, but later forbade the use of the Polish language in advertising, etc. It also laid a heavy hand on the activities of the Catholic clergy and made special efforts to suppress the Uniate church. The effects of this policy were considerably aggravated in 1886 by an Act of the Council of State permitting the appointment of officials in Poland who were not qualified to hold office in Russia.

On the other hand, the Russian government made every effort to tie Poland to Russia economically. As far back as 1822 a special tariff was arranged between Poland and the Russian Empire which made trade between the two countries almost free. As Russian Poland had also been guaranteed free commercial relations with the Austrian and Prussian parts of the ancient Polish Kingdom, it now became the great trade route between Western Europe and Russia. In 1850 Poland was included in the general customs boundary of the Empire, and the great system of railroads connecting Poland with St. Petersburg, Moscow, and the south of Russia was begun soon afterward. Special attention was devoted to the industrial development of the region, which soon became important as a great centre of the textile, steel, and other industries

Under the influence of economic considerations a new tendency in favor of reconciliation with Russia began to make headway in Polish life. In 1896 this tendency found expression in the formation of the *Narodowa Demokracja* (people's democracy), a political party which gave up the idea of the restitution of Poland and demanded merely national autonomy under the sceptre of the Czar. The same party soon spread its activities to Austrian and Prussian Poland, proclaiming everywhere the same platform—national self-government under the laws of the respective countries. This party was particularly strong among the aristocratic and capitalistic elements of the Polish population. The lower middle class and the industrial workers continued to strive for an independent Poland. The party with an extreme Nationalist programme was the Socialist Proletariat party (S. P. P.), which began its activities in 1882.

The Russo-Japanese War and the revolutionary movement of 1905-06 greatly aroused the hopes of the Polish nation. The elections to the First and Second Duma returned many Polish representatives, who immediately brought up the question of Polish autonomy. The Third Duma, elected on the basis of the reactionary law, was less favorably disposed to the demands of the Polish representatives. The Fourth Duma, however, passed a bill granting some of the elementary rights to the Poles, but it was voted down by the Council of State (the senate of Russia). When the European War broke out the commander in chief of the Russian army, Grand Duke Nicholas, published a manifesto to the Poles which proclaimed that the hour had struck for the realization of Polish hopes and called upon the Poles of all countries to unite under the sceptre of the Czar. The manifesto contained the promise that under this sceptre Poland would begin its regeneration "free in religion, language, and self-government."

The first realization of this promise so far was the law on municipal self-government passed March 17, 1915, to become effective Jan. 1, 1916. The law introduced high property qualifications for voters and subjected the local authorities to administrative interference on the part of appointed officials. Its only satisfactory clause was that which permitted the conduct of the official business in Polish. As a whole the law came as a disappointment to the Polish people and even to the Russian liberals who demanded the entire reorganization of municipal government on far more liberal lines.

The defeat of the Russian armies (see WAR IN EUROPE) in the summer of 1915 induced the Russian government to make another concession. On June 25, 1915, a special council of 12 (six Russian officials and six representatives from Poland) was appointed to consider the question of carrying out the promise of autonomy contained in the Manifesto of Aug. 14, 1914. The desire to conciliate the Polish people grew in view of the new situation created by the war. The political parties of Poland took advantage of every change in the situation to advance their national cause. A national committee was organized to press the claims of the Polish people. The differences between the principal programmes had not disappeared, however, but the tide in favor of national independence seemed to be growing. The idea of union with Russia met with the strongest opposition in Galicia, where the Poles have been enjoying national rights

and local self-government since 1867. The Austrian Poles fought valiantly for Austria and formed special Polish legions of Poles of all countries to fight against Russia. For Austrian Poland, see AUSTRIA-HUNGARY; GALICIA.

In Prussian Poland the struggle between Pole and German has been very active and has been fought out on an economic basis. It was Bismarck's policy to plant a Germanic population on Polish soil, and to this end vast sums were spent in buying up Polish estates, which were then peopled with German colonists. In spite of the strenuous efforts of the government, however, the Poles have more than held their own. The national spirit has undergone a great revival and has united the nobility and the masses in opposition to the domination of the Prussians. The policy of Prussification has been pursued by the government through the introduction of the German language in the schools, a measure which led to bitter dissatisfaction among the Poles and some slight disturbances in 1901. The pressure of Germanization was responsible to a considerable degree for the idea of reconciliation with Russia described above. It was the direct stimulus to the revival of the old idea of a Slavic Union against the Germans. The Poles and the Czechs called the Neo-Slavic Congress of Prague in 1908, at which an attempt was made to reconcile all Slavic nations and to lay the basis for a common Slavic policy. The attempt was not successful. The War which began in 1914 upset all previous calculations. The Poles were divided into camps fighting each other against their will. The war will probably leave its most devastating effect on Russian Poland, which was ruined by fire and sword. Galicia also suffered greatly. The great Polish problem in the near future will therefore be not only national restitution, but economic reconstruction. See POSEN, PRUSSIA.

Bibliography. Sources: *Scriptores Rerum Polonicarum* (Cracow, 1872 et seq.), *Acta Historica Res Gestas Poloniae Illustrantia* (ib., 1878 et seq.), both published by the University of Cracow. *Codex Diplomaticus Majoris Poloniae Documenta*, edited by the Literary Society of Posen (3 vols., Posen, 1877-79). Of works in English, S. A. Dunham, *The History of Poland* (London, 1831), is compact and useful, especially in its earlier portions, James Fletcher, *The History of Poland from the Earliest Period to the Present Time* (New York, 1840), is an interesting work, but less reliable than the preceding. Consult also: Kalixte de Wolski, *Poland* (London, 1883); H. K. B. Moltke, "Poland," in *Essays, Speeches, and Memoirs*, vol. 1 (New York, 1885), translated from the German, a valuable sketch; W. R. POLAND, RUSSIAN. An historical division, forming the westernmost part of the Russian Empire (Map: Russia, B 4). Russian Poland is known officially as the Privislanskiya Gubernii or Governments on the Vistula, and at the outbreak of the European War in 1914 it consisted of nine governments, Kalisz, Kielce, Lomza, Lublin, Piotrkow, Plock, Radom, Suwalki, and Warsaw, with a total area of 49,159 square miles, with 4,764,774 acres under forests. The greater part of the country is a plain, rising in the south into spurs and foothills of the Carpathian Mountains. The chief river is the Vistula, which passes from south to northwest through the centre of the country and with its branches waters the greater part of it, though the western part is drained by the German river Warta. The soil is fertile, and one-half of the area of the country is arable land. The principal crops are potatoes, rye, oats, and wheat. The raising of live stock, especially sheep and horses, is also important. Mining is carried on to a considerable extent in the southern highlands, and large quantities of coal and iron ore are produced. The total value of manufactured products was estimated at \$430,000,000 in 1912. Commerce is greatly facilitated by navigable rivers and over 2000 miles of railroad. The exports pass chiefly by way of Danzig and consist principally of wheat, timber, wool, and cattle products. The total population in 1913 was 11,960,500, consisting chiefly of Poles, with about 1,000,000 Russians, over 1,500,000 Jews, and a number of Germans. Russian is the official language and the language prescribed in the public schools. The Roman Catholic church

is adhered to by four-fifths of the inhabitants and is officially administered by the Ministry of the Interior at St. Petersburg. For further details, see articles on the separate governments; and for history, see **POLAND** and **WAR IN EUROPE**.

POLAR BEAR. The white or ice bear of boreal regions. See **BEAR**; **HUNTING BIG GAME**.

POLAR CIRCLE, or **ARCTIC CIRCLE**. See **ARCTIC**.

POLAR CLOCK (from Neo-Lat. *polaris*, relating to the pole, from Lat. *polus*, from Gk. *πόλος*, *polos*, pivot, axis, pole, from *πέλεσθαι*, *pelesthai*, to be in motion, connected with *Skt. car*, to move). A form of polariscopic clock invented by Sir Charles Wheatstone, based on the fact that light from the sun when scattered by the fine particles of the atmosphere becomes polarized. (See **POLARIZATION OF SKY LIGHT**.) It consists of a hollow conical tube so mounted that its axis can be brought parallel to the axis of the earth. This conical tube itself can be rotated and contains at its larger end, adjacent to a glass disk graduated to show the hours of daylight, a second glass disk, on which at the centre are cemented a star-shaped series of thin scales of selenite, which, when viewed by polarized light, exhibit strong contrasts of color. At the smaller end of the tube is mounted the Nicol prism with either of its diagonals making an angle of 45° with the principal section of the selenite plates. When seen through the Nicol prism the selenite will show a variety of rich colors, depending upon the position of the prism, but there will be two positions where the color will entirely disappear. Time is ascertained by turning the tube on its axis until the color of the star entirely disappears, while the central disk remains red; the index should then point to the hour. Unlike the sundial, the polar clock need not be placed in the sun's rays; it may stand in the shade of a tree or building or at a window, and it may be used when the sky is overcast, unless the obscurity is too great. POLARIS. See **POLESTAR**.

POLARISCOPE (from Neo-Lat. *polaris*, relating to the pole + Gk. *σκοπεῖν*, *skopein*, to view). An instrument which consists of any combination of a means of producing polarized light, or polarizer, and a device for testing the polarization of light, or analyzer. In ordinary light (see **LIGHT**) the direction of vibration is changing millions of times a second. As a result of reflection (or refraction), the direction may be made to remain constant, and the light is then said to be polarized plane, elliptically, or circularly, according as the motion of the ether particle is linear, elliptical, or circular.

When light is reflected from the surface of a transparent medium, as glass, at the polarizing angle, the tangent of which is equal to the index of refraction of the medium, it is found to be plane polarized, and the plane in which the

FIG. 1. TOURMALINE TONGS.

This apparatus consists of two plates of tourmaline so mounted as to revolve in their holders. The crystal or thin plate to be examined is placed between the two plates of tourmaline; the two plates act as polarizer and analyzer respectively.

incident and reflected rays lie is called the plane of polarization. If such a polarized beam of light is allowed to fall upon a second similar mirror at the polarizing angle, it will enter the medium or be reflected according as the plane of this reflection is parallel or perpendicular to that of the first reflection. Polarization by reflection was discovered by Malus in 1810. As early as 1690 Huygens discovered that the two rays of light produced by the double refraction in calcite were polarized at right angles to each other.

Three methods of obtaining a beam of plane-polarized light for experimental purposes are in

FIG. 2. NORREMBERG POLARISCOPE

The polarizing mirror is shown in place, while above, attached to the uprights, are lenses for producing parallel, divergent, or convergent beams of light, and a support on which thin plates or other objects to be studied may be placed. The bundle of thin plates at the top used as an analyzer may be replaced by a Nicol prism, shown to the right at the base of the instrument, or by a mirror at the polarizing angle, shown to the left.

general use and are employed in polariscopes: (1) reflection at the polarizing angle; (2) double refraction and the elimination of one of the beams, (a) by reflection (Nicol prism), (b) by sending it off to one side (Rochon prism, etc.),

and (3) double refraction and the absorption of one-beam tourmaline plates. The Nicol prism (q.v.) is most generally employed in polari-

FIG. 4. POLARISCOPE WITH POLARIZING PRISMS CROSSED.

scopes and forms one of the best means for the production and detection of polarized light.

In a polariscope the polarizer and analyzer may be similar or not. In the form devised by Norremberg (Fig. 2) the polarizer is the mirror at the bottom of the apparatus, and the analyzer is a Nicol prism in the eyepiece at the top, or it may be that a bundle of thin plates of glass are used, as shown in the figure. When the plane of polarization of both polarizer and analyzer is the same, the ray which emerges from the polarizer will pass on through the analyzer, and they are said to be parallel (Fig. 3), but if the two planes are perpendicular, then the beam will all enter as the ordinary in the analyzer and be reflected and lost, and they are said to be crossed (Fig. 4); the eye looking

in at the eyepiece sees a dark field. If a plate of transparent material be introduced between the polarizer and analyzer, it may happen that the field of the crossed combination will become light or colored. This will mean that the material has in some way affected the ray emerging from the polarizer so that it is no longer entirely cut off by the analyzer. Such substances are in general said to be double-refracting. Substances that do not so affect the polarized beam are called isotropic or single-refracting. The double refracting substances are generally crystalline and fall into two broad classes, uniaxial and biaxial. In certain double-refracting crystals there is one direction in which all light travels with the same velocity, and hence no double refraction occurs. This direction is called the optic axis, and such substances are uniaxial. In biaxial crystals there are two directions, or optic axes, along which all light travels with the same velocity and around which the optical properties group themselves.

Substances are studied in the polariscope in either parallel or convergent (or divergent) light, and the double-refracting media in general produce two beams from the original beam coming from the polarizer, and these two new beams, traveling with different velocities, are made to interfere when their components are brought into the plane of the analyzer. As white light is generally employed at the polarizer, and as the kind of interference is a function of the wave length, colors are usually seen at the analyzer. A complete study of these color phenomena, and their general behavior in the polariscope, make it possible to determine the identity of most minerals from their optical properties. This branch of optics has developed into microscopic petrography, which has so supplemented the other tools of the mineralogist and geologist that these sciences have been revolutionized.

Certain substances, as quartz parallel to the optic axis, solutions of sugar, tartaric acid, etc., possess the peculiar property of rotating the plane of polarization to an extent depending upon the wave length of the light and the thickness of the layer traversed. That is to say, if the polariscope is set crossed and a plate of quartz cut perpendicular to the axis introduced, the eyepiece field will appear lighter if monochromatic light is used, and it will be necessary to rotate the analyzer in order to obtain the dark field again. This rotation may be clockwise as viewed from the polarizer, right rotating or dextrorotatory, or it may be the reverse, left rotating or levorotatory. If white light is used colors will appear in the field of view, and the

FIG. 5. SOLEIL POLARISCOPE FOR LIQUIDS.

D is the tube in which the sugar solution is placed; C is a double quartz plate, half right and half left, rotating, which affords a very sensitive means of setting the instrument to the same adjustment each time; B is the polarizer. A is a combination of a Nicol prism and a quartz plate, which by rotation enables the observer to correct for the color of the solution and obtain the most sensitive tint in the double quartz plate C; F is the analyzer; G is a small Galilean telescope focused upon C, and E is the compensating system which corrects the rotation due to the solution instead of following it up. A plate of right quartz, b, is just neutralized by wedges of left quartz, a, when they are as shown at a.

tint crossed will always be complementary to that seen in the parallel position. These colors are in general due to the fact that, as the rotation for different colors is different, certain ones will be passed through the analyzer and others cut off.

The rotation of the plane of polarization in solutions of cane sugar is made use of commercially on a very large scale in testing and de-

termining customs duty on raw sugar for its content of crystallizable sugar. Very many forms of apparatus have been devised for this especial purpose. One of the more complicated, due to Soleil, is shown in Fig. 5, where the amount of rotation is neutralized by quartz wedges. If the solution rotates right, then the wedges are slid together so as to offer an excess of left rotation and neutralize the right rotation of the solution. If the solution is left rotating, the wedges are slid apart and the excess of right rotation neutralizes the rotation of the solution. The motion of the wedges is controlled by a rack and pinion and is measured by a scale which may be made to read off percentage of sugar directly, provided a solution of certain standard strength and length is used. In its most modern form this instrument was known in France as the *Soleil-Dubosq* and in Germany as the *Soleil-Ventzke-Schiebler*, but transition-tent instruments have been in large part supplanted by the half-shade polariscopes, of which there are a number of types of considerable accuracy, where equality of shade in the field is looked for.

In such a system the light from the polarizing prism is plane polarized in two planes, which make an angle to each other known as the polarizing angle, and upon the magnitude of this angle depends the accuracy with which settings can be made. The polarizing systems used in the best-known modern instruments are usually the Laurent, Jellet or Lippich type, the last named being a standard form of quartz compensating polariscope, employing as it does a white-light source and the quartz wedges arranged for direct reading. A polariscope of the Lippich principle arranged so that the position between the two polarizing prisms can be varied has been devised by F. Bates at the United States Bureau of Standards and has given an accuracy of $\pm 0.01^\circ$ S. for the polarizing of the better grades of sugar. See ELECTRICITY; LIGHT; SUGAR.

POLARITY, IN PLANTS. All plants, from filamentous forms having differentiation into base and tip up to the highest plants, show polarity of structure and function. This can be best presented by a few illustrations. If the cells of a filamentous green alga like *Cladophora* are separated, each cell will form a rhizoid at its base and a new green cell at its tip. If a portion of a willow sprout bearing several nodes is placed in a moist chamber, the most vigorous roots will develop from the morphologically basal nodes, and the most vigorous will sprout from the apical bud. If a scarlet runner plant having several internodes is deprived of its terminal bud, the bud in the axil of the first leaf below will begin growth and function as the terminal bud. If in turn this bud is removed, the one immediately below it will develop

and assume the function of a terminal bud, and so on down the plant. Any bud that happens to be functioning as a terminal bud inhibits the growth of all buds below it. The shortest possible slice of the thallus of a liverwort, provided it is one or more cells thick, may regenerate a new thallus. The apical face of the slice always produces the apical portion of the thallus, and the basal face the basal portion. From these illustrations it appears that every portion of a plant, even down to the individual cell, is differentiated into a basal and apical end, i.e., it is a polarized structure.

Polarity is generally already determined in the egg and cannot be reversed by modification of such external conditions as light and gravity. There are a few cases, however, where polarity is determined or even reversed by external conditions. Varying intensity of illumination on different sides of the spores of *Equisetum* and the eggs of *Fucaceæ* determines their polarity. The polarity in *Basidiobolus ranarum* may be reversed by unilateral chemical stimulation, and the same may be accomplished by unequal illumination of different regions of *Bryopsis* and many other algæ. A study of polarity in plants almost always implies regeneration or reparation and correlation (q.v.). See PHYSIOLOGY OF PLANTS.

POLARIZATION. A term used in physics with many applications, but usually to signify a property of matter or of the ether that has a definite direction. A magnet is said to be polarized; so is a dielectric under the action of electrically charged bodies. When, owing to the passage of an electric current through an electrolyte, there are chemical actions at the electrodes that oppose the current, the electrolytic cell is said to be polarized. When a definite characteristic is given ether waves—e.g., if the vibrations are all in one plane or if they are all in circles or ellipses—they are called polarized. See ELECTRICITY; LIGHT; POLARISCOPE; VOLTAIC CELL OR BATTERY.

POLARIZATION OF SKY LIGHT. The polarization of blue sky light was known to Huygens and is evident to any one who will look at the sky through a prism of Iceland spar. After a systematic investigation of the distribution of polarized light in different parts of the sky, Arago (1811) discovered that a certain portion or spot in the sky shows no polarization. This point varies with the altitude of the sun. Subsequently similar points were discovered by Arago (1840) and Brewster (1842). The maximum polarization occurs in a narrow zone 90 degrees distant from the sun. Similar but feeble polarization occurs in moonlit skies. There is no polarization in fog, cloud, or dense haze. As there is an evident connection between the polarization of sky light and the quantity of moisture, haze, or smoke in the atmosphere, there have been numerous investigations of this subject both from an observational and a theoretical point of view.

The simplest and most accurate polarimeter for studying this phenomenon was devised in 1872 by Prof. E. C. Pickering, director of the Harvard College Observatory. Observations made with this apparatus seem to show that the reflection of the sunlight from the surface of the sea into the atmosphere produced a decidedly perceptible disturbance of the polarization of sky light as compared with that observed from interior stations where such reflection from

water surfaces was impossible. Observations of sky light during total eclipses of the sun seem to have shown that the amount of polarized light increases during and just before and after totality. Such an effect might be produced either by the increased condensation of aqueous vapor, owing to the cooling of the atmosphere within the shadow of the moon, or by the fact that in place of the ordinary sunlight we now have to do with the polarized light from the solar corona.

The most acceptable theory as to the origin of the polarization is that started by the experiments of Tyndall on the reflection of sunlight from delicate clouds of vapor and perfected by Lord Rayleigh, who showed that when light is transmitted through a cloud of particles smaller than the wave length of the light, the latter is scattered laterally and polarized in the plane of scattering. In 1899 Rayleigh submitted the additional demonstration that not merely the grosser particles of dust and aqueous vapor, but even the molecules of oxygen and nitrogen, and probably those of other gases, take part in the process of scattering and polarization. Consult *United States Monthly Weather Review* (Washington, 1900) and H. H. Kimball, *Solar Radiation, Atmospheric Absorption, and Sky Polarization* (ib., 1910).

POLAR LIGHT. See TERRESTRIAL ELECTRICITY.

POLAR RESEARCH. The polar regions comprise all lands and seas within the polar circles, extending northward from the Arctic circle and southward from the Antarctic circle. The exploration of the polar regions has been slow and hazardous owing to adverse physical conditions. To the south the ice-covered continent of Antarctica is swept by violent and prolonged blizzards, while its coasts are difficult of access, being fringed by oceanic ice caps and projecting glaciers. To the north the vast Arctic Ocean is always ice-covered, except along the coasts of bordering southerly lands, by ever-moving fields of such compactness, extent, and thickness as to be unnavigable for ships and hazardous for sledge travel even during the colder seasons of the year.

Motives of Polar Research. Exploration in the Far North has been more frequent and extensive than in the Far South, chiefly because the Arctic zone is much nearer to the great maritime nations than are the Antarctic regions, and its waters are convenient of access from the main trade routes of modern times. The whale and seal fisheries were intimately related with the initiation and continuation of the great era of Arctic discovery in the seventeenth century. After Henry Hudson (1607) followed the winding fringes of the impenetrable ice fields from Nova Zembla to Greenland, for 150 years nearly all information of the Arctic regions was drawn from the log books of the Dutch and the English whalers. The commercial interests which first dictated great Arctic voyages had two distinct objectives. One was the endeavor to extend the area of the Northern fisheries; and while the prosecution of the Arctic whaling industries added a vast sum to the wealth of the world—estimated at more than \$600,000,000 in 200 years before the middle of the nineteenth century—it naturally resulted in large accretions to existing knowledge of the north-polar world. A more important object was the discovery of a navigable sea route between the ports of north-western Europe and of the Indies. Debarred or

restricted in their commerce around the Cape of Good Hope, the discovery of either a northeast or a northwest passage (qq.v.) would enable Northern nations to participate largely in the profitable trade of the Orient. This ambition was a great stimulus to Dutch and English explorations from the days of Barents, Baffin, and Hudson until the decadence of Spanish power.

These and other commercial incentives for polar exploration lasted until the beginning of the nineteenth century, and since they were fostered among the seafaring nations of the Northern Hemisphere, the natural result is that, while the unknown area of the Arctic regions is now not larger than European Russia, that of the Antarctic domain is double the area of Europe. As commercial interest waned, the thirst for extension of national interests led to systematic researches for new lands and new people, which incidentally—as in the voyages of Cook, Vancouver, Kotzebue, and others—added to the world's knowledge of the polar zones. The era of scientific research scarcely flourished before the middle of the nineteenth century. The humanitarian impulse that caused the dispatch of many expeditions to rescue Sir John Franklin resulted in enormous additions to a knowledge of the northern coasts of Arctic America. The renewal of Antarctic exploration at the beginning of the twentieth century, after an intermission of nearly 50 years, was owing largely to a spirit of scientific research, but in part for the purpose of geographic achievement—that of reaching the South Pole. In the past few years the work has again assumed commercial aspects, as indicated by the occupation and exploitation by France of the Kerguelen Islands and more especially through the annexation (1908) by Great Britain of Graham (or Palmer) Land, doubtless in view of the very lucrative whale and other fisheries, of which the South Shetlands group is the main base. Military reasons account in one case for the discovery of new land in the Arctic. About five years ago the Russian government commissioned two ice breakers to proceed from the Far East westward to the European coast in order to settle the vexed question raised by the war with Japan regarding the practicability of the northern passage for war-ships. The discovery of Nicholas II Land was the outcome of this expedition.

Equipment. The marked advance in the last decade of polar research has been in large part owing to improvements in methods of life and in outfits for work within the ice zones, based on the polar experiences of three centuries and perfected through the utilizations of modern inventions and of scientific knowledge. The problem of a fairly comfortable and hygienic existence for explorers in the polar regions has been solved. The food supplies long consisted of salted meats, and until recently the dietary of whalers and of explorers was such as was often followed by scurvy, which for three centuries has been peculiarly an Arctic disease. To-day it may be said that the selection and preservation of healthful foods of ample nutritive value for the use of polar explorers have been reduced to a scientific basis. The appearance of scurvy among members of an expedition to-day is the result of neglect or of ignorance. The ships formerly used by explorers were, as a rule, unsuited to ice navigation. In recent years vessels have been built specially with reference to use in ice, and the *Discovery*, *Fram*, *Gauss*, *Roosevelt*,

and *Taimyr* have proved to be ideal types for the various kinds of ice to be navigated. In addition to sail and steam power they have electric power, sanitary quarters, detachable rudders, and explosives suitable for use in freeing the ship when beset or for blasting open a way through short spaces of heavy ice. The introduction of electricity at the main shore stations not only tends to prevent mental depression caused by polar darkness, but also provides power for many purposes, furnishing heat for cooking and other uses. Wireless telegraphy also aids, serving to keep distant stations in touch with the outside world and to render possible calls for assistance. Portable huts, after the pattern of the Lady Franklin Bay Expedition (1881-84), assure at home stations facilities, unknown to earlier explorers, for comfort, for domestic duties and scientific work. Clothing and foot gear are adapted to conditions of travel and of weather, of which the general characteristics are known, thus reducing to a minimum the physical suffering, frost bites, etc. incidental to field work. For draft purposes in general the use of men has been conclusively proved to be inferior to the employment of dogs, or ponies, which animals are in turn gradually being replaced by power vehicles in the form of motor sleds and aeroplanes. Tentage, cooking apparatus, and sledging outfits have been improved in type, thus adding to efficiency by increased comfort and reduced labor. Under many conditions the introduction of the Norwegian ski has proved to be advantageous. While some of the methods of the Eskimo and other Arctic aborigines have been followed to advantage, the use of such people as allies is recognized as convenient at times, but as absolutely unessential to success. The journeys of Koch, Mylius-Erichsen, Shackleton, Scott, and Amundsen, exceeding in length others made elsewhere, prove the superiority of their personnel for sledging work under the most arduous and unfavorable conditions.

Finally, it may be said that increased knowledge of ice navigation in its various phases, selected lines of operation, wise provision for retreat, have very materially increased the percentages of success and reduced the number of fatalities. Polar exploration is no longer associated with undue loss of life, since its proportionate fatalities are fewer than those of tropical explorations. It has been authoritatively stated, e.g., that the loss of life in polar explorations since 1900 is but a tenth of that resulting from alpine climbing.

NORTH-POLAR EXPLORATIONS

Fully one-half of the area of the Arctic regions consists of well-known land, of which, however, only that of Norway, Sweden, and considerable portions of Siberia and Alaska are inhabited. Scattered Eskimo huts dot the sea-coasts of the north coasts of America, the Parry Archipelago, and Greenland. Occasional bands of Samoyedes frequent or inhabit Nova Zembla (q.v.), and miners occupy parts of Spitzbergen (q.v.). Exploration naturally turns to uninhabited portions, mostly to the north of the seventy-seventh parallel. The approaches to unknown Arctic regions are via Nova Zembla (see NORTHEAST PASSAGE), Spitzbergen (Greenland Sea), Franz Josef Land (Barents Sea), Lancaster Sound (see NORTHWEST PASSAGE), Smith Sound (West Greenland waterways), Bering Strait, and Arctic America.

The only north-polar voyage made via the Northeast Passage is that of F. Nansen (q.v.) in the *Fram* (1893-95). The ship was frozen in northwest of the New Siberian Islands, about 78° 50' N., 134° E., whence she drifted west-northwest to 85° 57' N., 70° E., and thence southwest to the Greenland Sea, where she escaped after a besetment of 35 months. Meantime Nansen, with Johansen, left the ship in an unsuccessful attempt to reach the pole, attaining 86° 04' N., 96° E., 7 miles north of the latitude of the *Fram*. The daring sledge men reached Franz Josef Land after travel of 153 days and limited the northeast extension of the archipelago by their journey. This expedition discovered a deep sea extending from 140° E. to 10° E., with a rich fauna. Occasional sounding reached 2000 fathoms.

Supplementary to the partial use of the Northeast Passage, initiated by Nordenskiöld (1875) as far as the Yenesei, and later pursued by Wiggins (1889 and later), Russia organized a hydrographic survey for the Siberian Ocean. This work has been pursued several years in the ice breakers *Taimyr* and *Viagatch*, operating via Bering Strait. In 1913 Vilkitsky, commanding the squadron, found his westerly way barred by ice at Cape Chelyuskin. Attempting to round the ice pack to the north, he discovered about 30 miles to the north a long island, 7 miles wide, running north and south. About 30 miles to the northwest was found another island, which terminated in about 81° N., 96° E. Landings were made on both islands, and geological specimens indicate that this archipelago, named Nicholas II Land (q.v.), is a continuation of the continent of Asia. Vilkitsky also discovered a small island on the northeastern edge of the New Siberian group, and, landing on Bennett Island, recovered the scientific collections of the late Baron Toll. In the summer of 1915 Vilkitsky made the first continuous passage from east to west. See VILKITSKY.

Hydrographically it is evident that Barents and Kara seas are inclosed, as doubtless other islands exist between Nicholas II Land and Franz Josef Land. Along the entire stretch of the continent of Asia exists a continental shelf, extending from 300 to 400 miles northward, dotted with various groups of small islands. Vilkitsky's soundings in 81° N., 96° E., ran from 10 to 100 fathoms; a short distance to the north the ocean probably deepens very rapidly.

Franz Josef Land (Barents Sea Route). While C. Weyprecht and J. Payer, two Austrians, were exploring Barents Sea (1872-74), their ship *Tegetthoff* was beset in 76° 22' N., 63° E., whence it drifted to the north for a year, and in August, 1873, the explorers saw an unknown region, Franz Josef Land. Before the retreat of the crew by boats to Nova Zembla (1874) the new land was explored by a sledge party. Payer's discoveries ran northerly through the centre of the archipelago and terminated at Cape Fligely, in about 81° 50' N., 58° E. Leigh Smith (1880, 1881) covered the southern coasts from 54° E. (Payer's westerly point) to 42° E., and while wintering at Cape Flora, after the loss of his ship, discovered the rich fauna and flora of these islands. Jackson, commanding the Harnsworth-Jackson expedition (1894-97), from his base at Cape Flora made extensive explorations between 42° and 56° E. and as far north as 81° 20' N. He

rounded Alexandra Land to the west and conclusively proved that Franz Josef Land consists of numerous islands of limited area, many covered by glaciers. It is here to be added that the discoveries of White Island (2000 feet high) by Kjeldsen (1876) and of New Iceland (also a frowning, snow-covered, lofty plateau) by Johannessen (1887) indicate that Franz Josef Land is merely an easterly extension of the great Spitzbergen Archipelago. Supplementing his Spitzbergen experiences (1894), Wellman renewed his attempts to reach the pole by a new route, Franz Josef Land (1898), when his subordinate Baldwin discovered Graham Bell Island, thus extending the limits of the archipelago to 65° E. In a north-polar attempt Prince Luigi Amadeo of Savoy reached (1899) in the *Stella Polare* 82° 04' N., northeast of Rudolph Island, and wintered in Teplitz Bay, 81° 47' N. He explored Austria Sound, while Captain Cagni on a polar journey reached 86° 34' N., 64° E.—then the most northerly point attained by man, within 206 geographical miles of the pole. The Russian expedition (1912) ended in the death of the commander, Sedoff, in the field.

Spitzbergen (Greenland Sea). In 1596 the Dutch Squadron, under Heemskerck and Ryp with Barents as chief pilot, discovered the islands of Bear and Spitzbergen, explored the west coast of the latter island as far north as 79° 49', Hakluyt Headland. In one of his remarkable voyages (1607) Henry Hudson, the English navigator, followed the west coast to 80° 23' N. (Conway shows that the latitude is overstated), crossed the Greenland Sea, discovered Hudson's Touches (now known as Jan Mayen), and sighted east Greenland in lat. 73° N. Hudson's discoveries and Poole's season (1610) in Spitzbergen led to a very lucrative whale fishery. Numberless whalers explored every sound and inlet of west Spitzbergen during the seventeenth and eighteenth centuries for commercial exploitation. Summer villages were even built, of which Smeerenburg, on Dane's Island, was the best known. The voyage of Carolus (1614) was notable, even if his claim to have reached 83° N. is clearly refuted by Conway. Carolus discovered Edge Island and was the first to report the separation of Greenland and Spitzbergen as evidenced by the great and constant southerly-drifting ice fields.

Efforts to explore the seas to the north of Spitzbergen have been singularly fruitless, owing to the ice-encumbered waters and the steady southward drift of the main ice pack of the Arctic Ocean. Phipps (1773) reached 80° 48' N., 20° E., only 25 miles beyond the point claimed for Hudson. Scoresby, the elder, attained (1806) 81° 30' N., 19° E., while Nordenskiöld and Otter (1868) reached 81° 42' N., 18° E. Parry in his remarkable boat and sledge journey (1827) pressed on to 82° 45' N., 18° E., the highest latitude ever attained in Spitzbergen water from the south—a world record for half a century.

Spitzbergen Archipelago. Scientific researches began in the archipelago with Clavering and Sabine (1824), followed by governmental expeditions of France—Fabre, Gaimard, Martins, and Marmier (1838); Russia and Sweden later measured an arc of the meridian (1898-1900). Expeditions have been so numerous that Conway names 87 principal voyages between 1855 and 1900. The most notable are:

Torrell and Nordenskiöld (1861) first explored Northeast Land; Carlsen (1861) first circumnavigated the Spitzbergen group; Koldewey (1868), first German expedition; Swedish polar expedition wintered at (1872-73) and Nordenskiöld first crossed Northeast Land; Leigh Smith rounded Northeast Land and reached 81° 30' N.; Swedish international polar expedition at Cape Thorsden (1882-83); Conway (1896) crossed by several routes the main island and surveyed 600 square miles of ice-free interior; Andrée established a balloon station at Danes Island and ascended (1896-97); Conway and Garwood explored interior of main island (1897); Nathorst (1898) circumnavigated Spitzbergen, landed on and explored Giles Land and Wiche's islands; Baron de Geer, ice flocks and glaciers (1908); Isachen, geological (1909); Zeppelin, climatology, etc. (1910); and the Monaco-Stoll, which crossed from Van Mijens (Low Sound) to Agardh Bay (1913).

The easterly extensions of Spitzbergen Archipelago include the lands of Giles (1707) and of Wiche (1617), which have given rise to endless discussions. Giles Land without much doubt is the same as the island reported as White Island and also as New Iceland. Giles Land was circumnavigated, visited, and explored geologically by Nathorst (1898). Wiche Land (q.v.), seen by Carolus (1614), earlier named by Edge, is sometimes called, after its largest island, King Charles.

For the commercial exploitation and industrial development of the Spitzbergen Archipelago, see SPITZBERGEN.

East Greenland Explorations. Northern voyages in early days were less successful in the western than in the eastern parts of Greenland Sea. Along the Greenland coast, however, whalers occasionally made high latitudes. Hudson saw the coast in 73° N. (1607), Hamke in 74.5° N. (1654), Ruys in 73.5° N. (1655), and probably Lambert in 78.5° N. (1670); but in those days little exactness was shown in observations. The earliest discoveries of importance were those of the Scoresbys, father and son. The elder Scoresby discovered and explored Scoresby Sound and adjacent inlets and also reached (1806) 81° 30' N., 19° E. William Scoresby, Jr., in intervals of whaling was indefatigable in explorations. As compared with other charts, those based on Scoresby's discoveries reduced the longitudinal extent of the east Greenland coast by three-fourths and determined the trend of the coast to be almost due north and south, between long. 19° and 25° W. He charted 800 miles of coast between 69° and 75° N. Wandel (1879) surveyed the coast between 66° and 69° N.

In the first expedition sent to this region Sabine and Clavering (1823) explored the coast from Pendulum Island to Shannon Island, 75° 12' N. Their successor, Graah (1829), followed the coast from Cape Farewell to near Cape Dan. Koldewey and Payer (1870) not only reached 77° 01' N. on the coast, but also explored Franz Josef Fiord, which penetrates five degrees of longitude to the interior, to 73° 11' N., 26° W. Local explorations and scientific researches were made by Nordenskiöld in King Oscar Harbor, Cape Dan (1883), and by Nathorst (1899) in King Oscar Fiord. At sea Naeko, a whaler, reached 75° 30' (1900) off the coast, but was surpassed by the Duke of Orleans, who (1905) reached 78° 16' N., re-

discovering Lambert Land, the most northerly verified latitude that has been reached by ship on this coast.

The systematic exploration of Greenland began under the Royal Greenland Commission in 1876 and has been pursued with a persistent success unparalleled in other governmental polar explorations. Its scope has covered botany, archaeology, ethnology, geology, hydrography, meteorology, zoology, etc., and its work has been so unusual as to have been 10 times recognized by award of medals. Between 1876 and 1912 54 expeditions were sent into the field, and their results have been published in 50 volumes, under the title *Meddelelser om Grønland*. Ten expeditions have explored east Greenland, on which region 15 volumes have been published, the most important being those of G. Holm, from Cape Farewell to 66° 25' N. (1883-85); Amdrup, from 65° 30' to 69° 25' N. (1898-1900); Ryder, from 69° to 74° N. (1891-92); and the *Danmark* (Mylus-Erichsen) expedition from 74° N. to 83° 30' N. (1906-08). Among important results were Holm's discovery of unknown Eskimo, about 600 souls, whose future has been safeguarded by Denmark through the establishment of a government station at Angmagssalik, a little south of Cape Dan. Among the geographical achievements, of which many are remarkable, has been the outlining of the entire coast of east Greenland from Cape Farewell to 83° 30' N., nearly 2000 statute miles in latitude, but nearer 5000 miles, as actually explored along the winding coast lines. Peary Channel has been eliminated, and the continuity of Greenland has been established to the most northerly point of land of the earth yet known.

As the first crossing of Greenland was from the east coast, such explorations are here summarized. Baron Nordenskiöld, after a failure (1870), starting from Auleitsivik, south of Disco, reached (1883) 68° 45' N., 43° W., an elevation of 6600 feet, only two-thirds across. First to cross was Nansen (1888), from Umivik, 64° 45' N., to Kangarsunak, south of Godthaab, the crest being about 8500 feet. Peary, after failing (1886), brilliantly crossed from McCormick Bay (1895) to Navy Cliff, 81° 37' N., 34° 5' W., at the head of Independence Bay, about 100 miles from the Greenland Sea, and returned over the same route. Again failing (1894), Peary repeated his crossing and recrossing to Navy Cliff (1895), though the feat nearly cost the lives of the party. Dr. De Quervain (1912) crossed from Jacobshavn to Angmagssalik, the summit in 8200 feet being one-third inland from Greenland Sea. Rasmussen (1912) made a more remarkable journey from Inglefield Gulf to Danmark Fiord, thence via Independence Bay to Navy Cliff and back to Wolstenholme Sound, the crest of the inland ice being 7200 feet. Lastly, Koch (1913) crossed the widest and most remote part of Greenland, from Queen Louise Land to Proven, south of Upernivik, finding the crest at about 9850 feet elevation, in 74° 30' N., nearer the western than the eastern sea. No part of the ice sheet of Greenland is 200 miles distant from parts explored. These journeys confirm the latest opinion that 95 per cent of the area of Greenland is ice-covered, and that no ice-free fertile interior valleys exist, as forecast by Nordenskiöld, and such as Greely discovered in the interior of Grinnell Land. In general, the crest of the inland ice is comparatively near the Greenland

Sea, though it bends westward between 70° and 75° N.

West Greenland Waterways (Smith Sound Route). In the first of his three voyages (1585) John Davis discovered Davis Strait, and after failure in 1586 in his third voyage of hazardous daring reached (1588) Sanderson's Hope, about 72° 12' N., and, turning his tiny sailing craft westward through the Middle pack, dreaded even to-day, reached the American coast. His discoveries included Greenland from Cape Farewell to Sanderson's Hope, and the American coast from Cumberland Gulf southward to Labrador. His successor, William Baffin, another great English sailor, in the *Discovery* of 55 tons, pushed yet farther north. Crossing Baffin Bay by the Middle Passage, he passed Cape York (1616), sailed north of Hakluyt Island, discovered Smith Sound, and turned back in sight of Cape Alexander. His latitude of 77° 45' N. was unequaled in these waters for 236 years. Baffin added to geographical knowledge the lands of Ellesmere and Prudhoe and the sounds of Jones, Lancaster, and Smith. In 1818, when English maps bore legends discrediting Baffin's discoveries, Capt. John Ross with two exploring ships turned homeward declaring that the sounds of Lancaster and Smith were closed bays. Inglefield (1859) reached 78° 28' N., off Cape Sabine, opened up Smith Sound, and penetrating Jones Sound charted 600 miles of unknown coasts. Kane (1853-55) pushed the *Advance* into Kane Sea to Rensselaer Harbor, 78° 03' N., 71° W., where the ship was abandoned, the party retreating by boat to Upernivik. Kane's discoveries covered the east coast of Grinnell Land to Cape Frazer, 79° 43' N., and along the Greenland shore to Cape Constitution, 80° 35' N., whence Kennedy Channel was visible. Hayes (1860-61), wintering the *United States* in Foulke Fiord, Smith Sound, penetrated the inland ice 50 miles. By sledge he followed the coast of Grinnell Land to the vicinity of Cape Goode, 80° 11' N. Hall in the *Polaris* (1871), opening up and navigating Kennedy and Robeson channels, was the first to enter the Arctic Ocean by this route, attaining 82° 11' N. Forced southward by ice, the *Polaris* wintered in Robeson Channel, on the Greenland coast under lee of a huge iceberg. He explored adjacent regions and charted Grinnell Land to its northern extremity, beyond the eighty-third parallel. Hall died (1871), and the *Polaris* was wrecked on its return voyage. Part of the crew, under Tyson (q.v.), drifted 1500 miles on ice fields and were rescued by the sealer *Tigress* off Labrador. Others of the crew, wintering at Polaris House, near Foulke Fiord, were rescued (1873) by a whaler near Cape York. Besides opening a route to the Arctic Ocean and to the North Pole, Hall discovered the termination of the inland ice at Petermann Fiord and the existence of several thousand miles of ice-free land to the north of the eighty-first parallel. Nares (1875) stationed one ship, the *Discovery*, in Lady Franklin Bay, while he pushed the *Alert* into the Arctic Ocean and wintered at Floeberg Beach, 82° 25' N., on the exposed coast of northeast Grinnell Land. Notable sled journeys were made: A. H. Markham on the Frozen Sea attained 83° 20' N., a world's record; P. Aldrich traced Grinnell Land to its northern cape (Columbia) in 83° 07' N. and thence followed westward to Cape Alfred Ernest, adding 220 miles of unknown coasts. From the

Discovery Archer explored Archer Fiord, and Beaumont, crossing Robeson Channel, extended the coasts of Greenland from Cape Bryant to Cape Britannia.

The United States sent the next expedition (1881-83), establishing under Lieut. (now Maj. Gen.) A. W. Greely an international polar station at Lady Franklin Bay, 81° 44' N. Its primary object was a series of simultaneous scientific observations covering the physical sciences—magnetic, tidal, pendulum, etc. Incidentally field explorations were made. The commander discovered and explored the ice-free interior of Grinnell Land, finding fertile valleys, plentiful animal life, and a glacier-fed lake (Hazen), and from the summit of Mount Arthur saw the western coast and possibly had a glimpse of Heiberg Land of Sverdrup (1901). Later Brainard and Lockwood, crossing Grinnell Land, traced the edge of the inland ice to the south, reached the sea on Greely Fiord, and discovered land to the westward to about 80° N., 83° W. In 1882 Lockwood and Brainard crossed Robeson Channel and by a long successful journey across the frozen sea extended Greenland to 83° 24' N., 40° 46' W., a world record, making known the most northerly land of the world. From the summit of the mountain near Cape Washington the landless, ice-clad sea was seen to the north of the eighty-fourth parallel. It was a world's record of nothing, and Peary's later journey shows that Greenland ends 14 miles farther north. During the retreat of the expedition, while wintering at Cape Sabine (1883-84), one of the party, F. Long, discovered Schley Land to the west, which indicated the probability of Hayes Sound being a closed bay—as it is. The geographic discoveries under Greely extended one-eighth of the way around the world north of the eightieth parallel and disclosed the fact that the Lake Hazen region was once permanently inhabited. The scientific work determined the secular variation of the magnetic declination for the Smith Sound region, determined climatic conditions, disclosed the unknown fact that the diurnal inequality of the tidal wave there conforms to the sidereal day, and made "a singularly successful determination of gravity." Sverdrup, failing in the *Fram* (1898-99) to circumnavigate Greenland, transferred his base to Jones Sound (1899-1902) and made extensive and important discoveries. He traced the shores northwestward to Svartevåg (renamed by Peary Cape Hubbard), within 60 miles of Aldrich's farthest (1876). Sverdrup also traced and explored the shores of three islands—Heiberg Land, extending from 79° to 83° W., and the Ringnes Islands, between 78° and 80° N., 92° and 106° W.

For a discussion of the discovery of the North Pole and other accomplishments of Peary, see PEARY, ROBERT EDWIN.

MacMillan's expedition (1913-15) planned the exploration of Crocker Land. From his base at Etah MacMillan crossed Grinnell Land by a new route and made an extended sledge journey to the northwest of Alex Heiberg Land. He extended about 50 miles our knowledge of the unknown Arctic Ocean, but it proved to be all sea. He crossed the site of the charted Crocker Land, reaching about long. 105° W., 83° 30' N., but no land was anywhere visible.

Lancaster Sound. This waterway, famous in connection with the Northwest Passage (q.v.), was discovered by Baffin (1616) and extended

westerly to the Arctic Ocean by Parry (1819) through Barrow Strait, Melville Sound, and Banks Strait. Wintering at Melville Island, Parry won the £5000 reward for passing the one hundred and tenth meridian, reaching 113° 48' W. This voyage was notable also as being the first made to the north of the magnetic pole, so that at one point the compass needle pointed due south. The loss of Franklin's squadron (1847) led to search expeditions through Lancaster Sound, with resultant discoveries of minor importance, the outlining of islands. Austin's squadron (1851) in journeys of 3340 miles, by Aldrich, W. H. Browne, Bradford, McClintock, Ommaney, and Osborn, added 670 miles of unknown coasts. Belcher's squadron (1852-53) made sledge journeys of 5900 miles, in which McClintock and Meham were leaders, with respective records of 1401 and 1163 miles. The most notable discoveries were those made by Collinson, McClintock, and McClure, the explorations of McClure adding Banks Land and Prince Albert Land, while McClintock's journeys covered Melville and Prince Patrick islands. Collinson, in his remarkable voyage (1851-54) along the northern coasts of America, explored the southern shores of Prince Albert, Wollaston, and Victoria lands.

Arctic America. The first land journey to the Arctic Ocean was that of Hearne (1771), who, joining an Indian war party, reached the mouth of the Coppermine, 67° 48' N. Alexander Mackenzie (1798), setting out to trace the waters of Slave Lake to the sea, with Indian guides reached, July 14, Whale Island, 69° 14' N., at the mouth of the great river that bears his name. The most notable man associated with the exploration of Arctic America is Franklin, who, cooperating on land with Parry at sea, pushed his advance base by winter journeys (1819-20) to Fort Enterprise, 64° 28' N, 113° W. Accumulating supplies on the Coppermine (1821), he reached the mouth of that river and explored the seacoast to the eastward to Point Turnagain, 68° 18' N, 109° W., turning back the same day that Parry sailed out of Repulse Bay, 539 miles to the east. Acting in concert with Beechy in Bering Strait and with Parry in Lancaster Sound, Franklin established his base (1825) at Fort Franklin on Great Bear Lake. Reaching the mouth of the Mackenzie, Franklin (1826) skirted the coast to the west and Richardson to the east. Franklin turned back at Return Reef, 70° 26' N, within 160 miles of Point Barrow. Richardson in a successful journey rounded Cape Bathurst, discovered Wollaston Land, and reached Cape Hope, 68° 58' N. He traced the continental coasts through 20 degrees of longitude and two of latitude, discovered a new land, determined tidal conditions, and made valuable physical observations.

Capt. George Back from his winter base (1833-34) at Fort Reliance, Great Slave Lake, discovered Great Fish (Back) River and explored the coast to the east of its mouth as far as the entrance to Simpson Strait. Dease and Simpson, operating from Fort Chipewyan (1837), reached Point Barrow to the west. Wintering at Fort Confidence (1838-39), they explored the continental coast to the eastward, discovering Simpson Strait and exploring the south shores of King William Land to Cape Herschel, 68° 41' N., 89° W. From Repulse Bay as a base, Rae virtually completed the coast

line of Arctic America by proving that Boothia Felix was a peninsular extension of the continent. A portion of the west coast of Melville Peninsula remained unknown, between the farthest of Rae (1846) and of Parry (1827), which was traced by C. F. Hall (1868) in his Franklin search. The northern coasts of America were searched by Richardson and Rae (1848-49) for news of Franklin, when Rae explored parts of Wollaston Land. Wintering at Repulse Bay, Rae in April, 1854, fell in with Eskimo, who gave the first news of the Franklin disaster, confirming their story of the retreat on King William Land by showing silver with the crest of Franklin and other officers. Schwatka and Gilder (1878-79) exhaustively searched King William Land, where new graves, skeletons, and relics of the Franklin expedition were found.

V. Stefánsson (q.v.), with Dr. R. M. Anderson (1908-12), under the auspices of the American Museum of Natural History, undertook the ethnological exploration of western Arctic America. From a base on Coronation Gulf Stefánsson traveled (living with the Eskimo) 1900 miles; 700 miles were through Victoria Land and adjacent regions unknown to white men. He found a tribe of so-called blond Eskimo, who never before had seen a white man; they lived in summer on Victoria Land and in winter on the ice of adjacent waterways, where seal were plentiful. Anderson's collections added much to a knowledge of the fauna and flora of these regions. Later (1913-14) Stefánsson commanded an expedition sent by the Canadian government to explore the Arctic lands to the north of the Dominion, with three ships and a body of scientists. Bad ice conditions prevented the *Alaska* and the *Mary Sachs* from proceeding farther to the east than Collinson Point, where Stefánsson and Anderson wintered. The besetment of the *Karluk* caused the failure of the main purpose of the expedition—to explore the regions to the west of the Parry Islands. Beset in 70° 47' N., 150° W., the *Karluk* drifted from Sept. 22, 1913, to the northwest in 73° N., 162° W., having crossed a section of deep water, about 1200 fathoms. She turned to the southwest and, crushed by the ice, sank on Jan. 11, 1914, in about 71° 30' N., 175° W., some 60 miles N. by E. of Herald Island. Two parties of four men disappeared in making their way to Herald Island, but the remainder, under Captain Bartlett, reached Wrangell Island with supplies February 18. Late in March Bartlett, with one Eskimo, crossed Long Strait to Asia and through the aid of a Russian official, Baron Kleist, reached Providence Bay, Siberia. Two men died on Wrangell Island, but the survivors were rescued by Swenson, in the *King and Wing*, on September 7.

Undaunted by the loss of the *Karluk*, Stefánsson with a small supporting party left Martin Point, Alaska, in April, 1914, on his forlorn sledge journey over the frozen Arctic Ocean, here known as Beaufort Sea. He had the double purpose of locating the continental shelf north of Alaska and of exploring the vast region of unknown lands. When his supporting sledge turned back, about 75 miles from the coast, the soundings indicated the edge of the continental shelf, the sea deepening from 34 to 70 and then to 180 fathoms. Prudence would have dictated Stefánsson's return also, but his previous successful experiences caused him to rely

on the supplementing of his scanty food supplies by sea game until land was reached. He took two men, one sledge (with canvas cover for crossing water leads), two months' provisions, and ample ammunition. Thus equipped, he started north in search of the land—forecast by Greely as the birthplace of Arctic floebergs and by Harris as the causation of abnormal tides in the Arctic Ocean.

Stefánsson's journey and successes are among the marvels of polar exploration. From April, 1914, till June, 1915, he lived on the pack, obtaining much sea game. From Prince Patrick Island, the northwest point of Parry Archipelago, he traveled north on the ice and on June 18, 1915, discovered a rugged unknown land in lat. 78° N., long. 117° W., and observed 100 miles of its coasts—thus indicating an area of considerable extent. The portion of the new land seen is directly north of Prince Patrick Island, some 40 miles from McClintock's farthest (1852) and about 100 miles due west of Ringnes Land discovered by Isachen under Sverdrup (1901). The new land of Stefánsson is a westerly extension of the great Arctic Archipelago, of which Grinnell Land is the most northeasterly and most important known land. Probably its western extension will end in an equally large land area. Stefánsson continues his explorations, departing from Herschel Island Aug. 23, 1915.

Bering Strait. Last and least important of north-polar routes is that through Bering Strait. Doubts have been expressed as to the alleged voyage (1648) of Deshneff from Kolima, on the north coast of Asia, through Bering Strait. Bering (1728) added nothing as to northern Alaska, which was visited by Gwosdef (1731). The great English sailor, Cook, reached (1778) Icy Cape, 70° 44' N., and Kotzebue discovered (1826) Kotzebue Sound, not seen by Cook. Though Beechey's ship turned back (1826) from the seventy-first parallel, his boats under Elson reached Point Barrow, the most northerly land of that region. Collinson, Kellett, and McClure are mentioned under the Northwest Passage (q.v.). Rodgers made a record (1855) for latitude in that sea by reaching 72° 05' N., 164° W., since surpassed by the *Karluk*. American whalers have actively navigated these waters, and De Long (1867) first sailed along the land reported by and named after Wrangell. De Long's north-polar expedition (1879-81) added much to a knowledge of these regions. Beset in the pack, his ship, the *Jeannette*, drifted westward off the north coast of Wrangell Land, disproving the theory that it was a continent reaching to the pole. Drifting west by north, the De Long Islands, a northeast extension of the New Siberian Archipelago, were discovered and visited by Melville (1881). After the *Jeannette* was crushed the drift carried De Long, while retreating to the Siberian shore, as far northward as 77° 36' N., 155° E., the most northerly point ever reached in the Siberian Ocean from Bering Strait. Nansen's successful continuation of the drift project of De Long is noted under the Northeast Passage (q.v.).

ANTARCTIC EXPLORATIONS

The continent of Antarctica, ice clad, uninhabited, devoid of land fauna, and desolate, has in late years been the centre of exploring activities. This continent existed hypothetically

for many centuries, until James Cook (1773-74) eliminated it from the maps. Entering the Antarctic circle at four widely separated points, his southernmost position was $71^{\circ} 10' S.$, $107^{\circ} W.$, but he found only ice-strewn seas and no land. For convenience the southern regions are divided into four quadrants, named from the three continents and the ocean directly to their north—Africa, America, Australia, and Pacific. Early reconnaissance maps of these lands are being gradually replaced by more accurate documents. Scott's and Mawson's expeditions both yielded noteworthy cartographic results, based on the use of the theodolite and plane table.

Continent of Antarctica. This land is distinctive from all other continents in several respects. Its area is estimated at over 5,000,000 square miles. It has the highest elevation, and its climate is exceedingly harsh; it has no land fauna and practically no flora; it exhibits no remains of previous human life; it is the relic of the great Ice age on an extended scale and is fringed by a succession of great oceanic ice caps, not found elsewhere. Omitting minor indentations, but not including the seaward boundary of fast ice, its coast line is not less than 14,000 miles long. Its average elevation exceeds 2000 feet as against 800 feet for Asia. The central south-polar plateau, more than 10,000 feet above the sea, is bounded by mountain ranges with summits rising to 15,000 feet or more. Only rare mountain peaks and occasional shore cliffs are snow-free. The continental ice sheet is of unknown thickness, but it is thought to reach 2000 feet in places, while in ages past it must have been more than 1000 feet thicker. Including the ice cap, the mean altitude of Antarctica is estimated at 3000 feet. At Commonwealth Bay, Adellie Land, the average wind velocity for an entire year was 50 miles an hour and for days exceeded 100 miles hourly. The mean temperature of the south-polar plateau has been estimated as approaching -40° . The very steep gradients along the coasts accelerate the downward flow of the glacial streams, which thus extend in unbroken form over great areas of the sea, the oceanic surfaces thus covered ranging from hundreds to tens of thousands of square miles in extent. Antarctic geology is in a stage of evolution, and the beacon sandstone series of the Australian quadrant, with the fossil contents, is most important. Scott's and Mawson's collections of fossils in that quadrant, and Nordenskiöld's from the American quadrant, should throw much light on the two important geological problems of the Antarctic—the climate of past ages and the former distribution of sea and land, especially as to the former connection of Antarctica with continents to the northward.

African Quadrant (from long. 0° to $90^{\circ} E.$). This might well be called the unknown region, as no one has reached a latitude of $70^{\circ} S.$ and no land of extent has been therein seen. Cook (1772) barely crossed the circle, to $67^{\circ} 15' S.$, $38^{\circ} E.$ Bellingshausen (1820) followed virtually the circle across the whole quadrant and, sailing 16 degrees of longitude within it, reached $69^{\circ} 21' S.$ in $2^{\circ} 14' E.$, $66^{\circ} 53' S.$ in $41^{\circ} E.$ and $69^{\circ} 06' S.$ in $10^{\circ} 43' E.$ Morrell (1823), whose positions are questioned, reached $69^{\circ} 11' S.$, $48^{\circ} 15' E.$; doubtless his longitudes are incorrect, as were those of many contemporaries. Biscoe (1831) sailed to $69^{\circ} S.$, $11^{\circ} E.$, and discovered Enderby Land in about 66°

$25' S.$, $49^{\circ} E.$ Kemp (1833) discovered land, named after him, in $66^{\circ} S.$, $59^{\circ} E.$ Moore (1844) claims land in $64^{\circ} S.$, $49^{\circ} E.$ Nares in the *Challenger* (1874) barely crossed the circle in $78^{\circ} 22' E.$, but saw no land. His dredge nets, however, gathered such wealth of widely dispersed, continental rock fragments as enabled Murray definitely to forecast the existence of the continent of Antarctica. Drygalski's (1902) Kaiser Wilhelm Land, $87^{\circ} E.$ to $94^{\circ} E.$, being partly in the Australian quadrant, is treated therewith.

American Quadrant (from long. 0° to $90^{\circ} W.$). The continent of Antarctica has its most northerly extremity in this quadrant. Its discovery was credited to Nathaniel B. Palmer, an American sealing captain from Stonington, Conn., who from the home station on the South Shetlands sailed southward (1820) to the new land, 60 miles to the south. This discovery was charted on the Powell map (1822) as Palmer Land, but the name was unwarrantably changed 10 years later to Graham Land by the British Admiralty. Bellingshausen (1819-21) discovered two islands (January, 1821), Peter I and Alexander I. Through other explorers Palmer Land has grown into continental dimensions, so that its extreme limits as now known extend from lat. 63° to $70^{\circ} S.$ and long. 52° to $77^{\circ} W.$ Biscoe (1831), reaching $67^{\circ} S.$, $72^{\circ} W.$, discovered Biscoe Islands. D'Urville (1838) renamed parts of the region as Joinville and Louis Philippe Land, and Ross (1843) added Cockburn Island. Explorations long ceased, but the whaler Dallmann (1873) entered Bismarck Sound, later proved to be a bay, in $64^{\circ} 45' S.$ Robertson (1892) added Dundee Island. Larsen (1893) found sedimentary fossils on Seymour Island and extended the east coast of Palmer Land to $68^{\circ} 10' S.$, under the name of King Oscar Land. De Gerlache (1897), through a drift of 14 months from $80^{\circ} W.$ to $102^{\circ} W.$, reached $71^{\circ} 31' S.$, where a sounding of 210 fathoms indicated that the ship was on the continental shelf. Gerlache Strait and Danco Land were discovered, and the drift was south of Peter I Island. Evensen (1893) reached $69^{\circ} 10' S.$, $76^{\circ} 12' W.$, approaching very near to Alexander Island, and skirting the glacier-covered coasts of West Palmer Land. Norden-skiöld (1902-03) discovered on Seymour Island two floras, Jurassic and Tertiary, and explored the east coast of Palmer Land to $66^{\circ} S.$ Charcot (1903, 1910) in two voyages extended Palmer Land to the southwestward. He discovered two new regions, Loubet Land and Charcot Land—the latter in $70^{\circ} S.$, $77^{\circ} W.$ He navigated the *Pourquoi Pas?* also from 60° to $124^{\circ} W.$, his course being mostly between lat. 69° and $70^{\circ} S.$ and through much sea that was unknown. Most important, he proved conclusively the continuity of Palmer Land, which some geographers had believed to be bisected by straits. It may be added that the fisheries of this region have so greatly developed lately as to involve millions of dollars of values annually, and that Great Britain has assumed control, by proclamation, of the regions south of the fiftieth parallel and between long. 30° and $80^{\circ} W.$

The southward extension of a great bight (Weddell Sea) was discovered by Weddell (1823) to reach to $74^{\circ} 15' S.$, $34^{\circ} 17' W.$, 185 miles south of Cook. It was extended in area by Ross (1843) and by Bruce (1903), who reached $70^{\circ} 25' S.$ Later Bruce (1904)

navigated the sea to the southeast, reaching 74° 01' S., 22° W., and discovered unknown territory, Coats Land, which extends from 72° to 74° S. and between 17° and 23° W. Further extensions were made by Filchner (1912), who discovered new land, named Prince Luitpold, in 78° S., between 33° and 38° W. It is this last-named land that is serving as the home (starting) base of Shackleton, who, after there wintering (1915) and exploring adjacent lands, begins his transantarctic journey to the shores of Ross Sea in the Australian quadrant. Such a journey will definitely settle the moot point as to the continuity of Antarctica, which a very few geographers believe to be bisected by a strait.

Australian Quadrant (from 90° E. to 180° E.). As the easiest route to the pole and as presenting the most interesting and extended portions of Antarctica, the Australian quadrant is of special importance. Yet it was the last to be explored, as neither of the great navigators, Cook and Bellingshausen, entered the circle herein. Balleny (1839) discovered in about 165° E., 67° S., a group of five islands to which his name is attached. His Sabrina Land, reported as in 65° S., 121° E., does not exist. The earliest voyage of importance in these seas was that of the United States squadron under Charles Wilkes, which (1840) virtually followed the Antarctic circle through ice-filled seas about 50 degrees of longitude, from 155° E., 66° 20' S., to 106° E. At various points land was seen—the first on Jan. 19, 1840, though there was much uncertainty as to whether later certain earth-stained oceanic ice caps were not mistakenly viewed as ice-covered land. Wilkes skirted 1600 miles of this glacier-faced region, the ice cliffs rising from 50 to 200 feet high along the continental shelf, which his soundings clearly indicated. Probably his longitudes were somewhat in error, but Mawson's discoveries show the continent that Wilkes first reported is in existence. Simultaneously D'Urville with a French squadron explored (1839-40) these seas and on Jan. 20, 1840, discovered Adélie Land, about 700 miles distant from Wilkes at the time. D'Urville's Côte Clarie proves to have been a projecting glacier, or oceanic ice cap, which had disappeared before Davis (1912) explored this region. Wilkes's discoveries were discredited for 60 years, when Drygalski (1902), wintering in the Antarctic pack off Gaussberg, discovered Kaiser Wilhelm Land, on the Antarctic circle between long. 87° and 93° W., a westerly extension of the continent of Wilkes. Later Shackleton (1909) extended the north coast of Victoria Land to a point 45 miles west of Cape North. Scott's last expedition (1912) discovered Oates Land, a westerly extension of Victoria Land, in 70° S., between 162° and 158° E.

It remained for an Australasian expedition, under Douglas Mawson (q.v.), to explore (1911-14) the debatable region between 93° E. and 158° E. Mawson established his base at Commonwealth Bay, Adélie Land, 67° S., 143° E., and his comrade Wild occupied another in 66.7° S., 97° E., on the Shackleton Oceanic Ice Cap. Mawson discovered and explored King George V Land as far south as lat. 70° 30' S. and between long. 138° and 152° E. Wild explored the new Queen Mary Land between 101° 30' E. and Gaussberg in 88° 45' E. By ship Davis traced the continental shelf and discovered un-

known land between Mawson and Wild. Altogether the northern coasts were traced through 55 degrees of longitude and Wilkes's continent placed beyond dispute. Indeed, it is quite unquestioned that Antarctica is a continuous land between Kaiser Wilhelm Land of Drygalski in 86° E. and Carmel Land of Amundsen in 158° W., a stretch of 116 degrees of longitude. The new lands of Mawson, save rare peaks and cliffs, are entirely covered with glacial ice sheets of great thickness, which move constantly seaward. At various points glaciers push unbroken into the sea, forming true oceanic ice caps. The Mertz and Ninnis glaciers of King George Land each cover more than 1000 square miles of ocean. Most remarkable is the Shackleton Ice Cap, which covers 36,000 square miles of the Antarctic Ocean, being 180 miles north and south by 200 miles east and west, its average thickness was about 600 feet. Most marvelous of all these ice caps is that known as Ross's Barrier, situated in the light between the lands of Victoria and Edward VII. While Scott tentatively estimates its surface area at 120,000 square miles, it probably does not fall below 100,000 square miles, a surface area greater than that of the two States of New York and Pennsylvania.

The discovery most prolific in the extension of Antarctic lands was that of J. C. Ross (1841). He carried Victoria Land from Cape North, about 70° 30' S., to 78° S. and added that wonderful remnant of the Ice age, the Ross Oceanic Ice Cap, which he called the Barrier, and where he reached lat. 78° 10' S., long. 161° 27' E., a southing 235 miles beyond that of Weddell. The Ross Ice Cap presented an unbroken series of ice cliffs 350 miles in sea front and rising from 100 to 200 feet above the sea. Borchgrevink (1900) reached 78° 50' S., 164° E., after wintering at Cape Adare—the first winter passed by man within the Antarctic circle. Then followed three historic British expeditions, whose advances were most brilliant and whose valuable scientific contributions are by far the most important in Antarctic records.

Scott (1901-03) (q.v.) eliminated the Parry Mountains of Ross, and sailing along the Ross Ice Cap discovered to the east of it King Edward VII Land, trending northeast between long. 152° and 153° W. In an attempt to reach the pole Scott made (1902) a record southing in 82° 17' S. This was on Ross Ice Cap, which was unchanged in appearance and in elevation 380 miles southward of his ship. A journey of 300 miles to the interior of Victoria Land disclosed unbroken glacial regions, increasing in elevation to the south. Shackleton (1909), from his base at the west end of the Ross Ice Cap, made an extraordinary sled journey, in which he reached 88° 23' S., about 162° E. His farthest was within 97 miles of the South Pole, 366 miles beyond the record—the greatest advance made by any man within the Antarctic circle. Finding a mountain range in 83° S. barring his progress, he ascended Beardmore Glacier—a rise of 6000 feet in 100 miles—and emerged on the great ice-clad south-polar plateau which is about 11,000 feet above the sea. His assistants, David, Mawson, and Mackay, located approximately, through a journey of 200 miles inland, the south magnetic pole in 72° 25' S., 155° 16' E. The geological collections show a former milder climate, with exten-

sive vegetation near the pole, and should reveal information as to the structure of Antarctica. Scott's last expedition (1911-13) had a tragic ending in the death of Scott and four others on their return from a successful sledge journey to the South Pole. The ill-fated expedition attained its goal on Jan. 18, 1912, only to find by the records left by Amundsen (q.v.) that he had preceded them by 35 days. The discoverer had written a letter directed to whoever should reach the pole after him, giving proof of his priority in the achievement. The missive was left in a tent which Scott duly photographed, after making note of the contents of the message that it sheltered. Scott's polar trip was not unproductive, for the fossils gathered by his party and dragged on to the end, at an eventual cost of their lives, should do much under expert discussion to determine the past geological history of Antarctica. Scientific data gathered elsewhere by the expedition promise important conclusions in other branches of knowledge.

Amundsen's journey (1911-12), frankly acknowledged to have been made only for the attainment of the pole, was carried out with magnificent precision. In a sledge trip from the edge of the Ross Oceanic Ice Cap, where he had wintered, Amundsen reached the South Pole, after a journey of 870 miles, Dec. 14, 1911. The pole is on a plateau 10,500 feet in elevation, with no mountains near. Amundsen crossed two mountain ranges, Dominion and Queen Maud. His most important discovery is the southerly termination of the Ross Oceanic Ice Cap, in 85° S., 164° W., thus proving the probable continuity of Antarctica by joining Victoria Land and Edward VII Land. His assistant Prestrud explored parts of the last-named region and gives to his discoveries the name of Carmel Land, in about 82° S., 150° W. Edward VII Land was visited by a Japanese expedition (1910-11) under Shirase, who succeeded in penetrating the land to some distance.

Pacific Quadrant (from 90° W. to 180° W.). In this great southerly extension of the Pacific Ocean there is no known land in the Antarctic regions between 90° W. and 150° W., although several explorers have entered the quadrant. Cook (1774) entered the circle at 147° W. and in 106° 54' W. reached 71° 10' S. Bellingshausen here excelled, reaching (1820-21) 67° S. in 164° 34' W., 67° 30' S. in 120° W., and 60° 53' S. in 92° 19' W. Walker (1839) reached 70° S. in 105° W. Ross (1841) attained 67° 29' S. in 159° W. Charcot's southing and Gerlache's drift appear under the section *American Quadrant*, and King Edward VII Land, being a continuation of Victoria Land, has been treated under the section *Australian Quadrant*.

POLAR WHALE. The Greenland or "right" whale. See **WHALE**.

POL DE MONT, pól de món (properly KAREL MARIE POLYDOOR DE MONT) (1857-). A Flemish poet and critic, born at Wambeke, Brabant. He was educated at the University of Louvain and became professor of the Dutch language and literature in the Athenæum at Tournai and (1882) at Antwerp. After 1886 he was also professor of the history of literature at the Académie des Beaux-Arts, Antwerp, and after 1904 curator of the museum. His chief works are: *Waarheid en Leven* (1877); *De eerste mensch* (1879); *Lentesotternijen* (1881); *Loreley* (1882); *Fladderende Vlinders* (1885); *Claribella* (1893); *Iris* (1894); *De Amman van Antwerp* (1901); *Vier Vlaamsche Legendes* (1904); also biographies of Hendrik Conscience (1883) and of Jan van Beers (1886).

POLDER, pól'dér (Dutch, morass). A name given in the Netherlands to that portion of dry land which was formerly below the level of the sea or the nearest river and has been reclaimed by building a dike, called a ringvaart, around the region to be drained and brought under cultivation. On such an embankment machinery for lifting water is placed and worked by wind or steam power. Successive embankments and canals are built as the work proceeds. In North Holland in the Schermer polder four such embankments and intermediate canals were necessary in order to reclaim the lowest part of the polder. A large portion of the cultivated land of the Netherlands has thus been reclaimed from the ocean. The largest of the finished polders is that which occupies the former site of the Haarlem Lake and covers about 50,000 acres, or about 80 square miles. At present still larger polders are in the course of being drained.

POLE. In geography, one of the two extremities of the axis round which the earth revolves. They are therefore situated the one on the north and the other on the south side of the equator, and equidistant from all parts of it, or in lat. 90° north and lat. 90° south, respectively. They are called the north and south poles of the earth. In astronomy, the poles, which, for distinction's sake, are denominated celestial poles, are those points in the heavens to which the earth's axis is directed and round which the heavens seem to revolve. The celestial poles are valuable points of reference to astronomers and geographers, so that the determination of their position in the heavens is a matter of the greatest importance. Unfortunately, no stars mark their exact situation (see POLESTAR), though there are minute telescopic stars only a few seconds from the north pole. The position of the polar point is determined as follows: a bright star (usually the polestar) is selected, and its position in its upper and its lower culminations (q.v.) is accurately noted, with the meridian circle (q.v.); the point midway between these two positions of the star is the pole of the heavens. The observation of the two positions of the star must be corrected for refraction, and it is for this reason that the polestar is selected, since the effect of refraction is much the same in both positions of the star. The term "pole" has, however, a wider application in astronomy, as in spherical geometry, denoting the extremities of a line passing through the centre of a great circle perpendicular to its plane; thus, we have the poles of the horizon (zenith and nadir), the poles of the ecliptic, the poles of a meridian. Pole in physics denotes those points of a body at which

its attractive or repulsive energy is concentrated. See TERRESTRIAL MAGNETISM.

POLE, MATTHEW. See POOLE, MATTHEW.

POLE, OF A MAGNET. See MAGNETISM.

POLE, REGINALD (1500-58). Cardinal, Papal Legate, and Archbishop of Canterbury. He was born at Stourton Castle, Staffordshire, in March, 1500, the son of Sir Richard Pole, by Margaret, Countess of Salisbury, daughter of the Duke of Clarence, the brother of Edward IV. His early education was received from the Carthusians at Sheen, whence, being liberally provided for by Henry VIII, he passed to Magdalen College, Oxford, and, although still a layman, received several valuable preferments through the favor of the King. For the further prosecution of his studies he went, in 1521, to the University of Paris, and thence to Padua, where he formed the friendship of a distinguished group of scholars and others, all of whom subsequently took a leading part in public affairs—Contarini, Bembo, Sadoleto, and others. In 1527 he returned to England, where the highest ecclesiastical dignities awaited his acceptance. In 1529-30 he was in Paris, where, reluctantly obeying royal orders, he collected opinions favorable to Henry VIII's divorce from Catharine of Aragon, but on his return he courageously endeavored to dissuade the King. In 1532 Pole was again on the Continent, whence he issued his *Pro Ecclesiasticæ Unitatis Defensione* (1536), taking strong grounds against the divorce. At the end of 1536 he went to Rome, where he was ordained deacon and made Cardinal. In February, 1537, he was appointed Papal Legate to England, but his commission was not then discharged. His position had greatly enraged Henry, whose resentment fell upon Pole's elder brother and upon his aged mother, the Countess of Salisbury. During the rest of Henry's reign Pole remained in exile. The papacy, for the maintenance of whose authority in the cause of the injured Catharine Pole was regarded as a martyr, treated him with distinguished favor. He was employed in many affairs of the highest importance, being sent as Legate, in 1537, to France and the Low Countries, from both which states Henry VIII in vain demanded his extradition. He also took an active part in the discussion on the Interim, and when the Council of Trent was opened he was appointed one of the three legate presidents who acted in the name of the Pope, Paul III. He was influential in molding the decrees, especially those on sin and justification. On the death of Paul, in 1549, Pole was all but elected to succeed. For some time after this he resided chiefly in a monastery, near Verona, in comparative retirement, until the accession of Mary called him back to active life as the main instrument of the reconciliation of England with the papacy. On Nov. 24, 1554, Pole solemnly entered London as Legate, possessing in equal degree the confidence of the Queen. In the arduous charge thus intrusted to him he acquitted himself with much prudence and, considering the circumstances of the time, with singular moderation. In the severities which marked the later history of Mary's reign it is all but certain that Pole had no share. He was ordained priest March 20, 1557, and consecrated Archbishop of Canterbury two days after, and later made chancellor of the universities of Oxford and Cambridge. On the difficult and critical question of the disposal of the Church property confiscated by Henry VIII, Pole, who saw the necessity of moderation, was

or a time at issue with the Pope; but his representations were successful in producing a more moderate policy, and the work of reunion appeared to proceed with every prospect of a complete and permanent issue, when it was interrupted by the death of the Queen, Nov. 17, 1558. Pole died within 12 hours after. Besides the treatise *De Unitate*, already mentioned, he is also the author of a book *De Concilio* and of other treatises on the authority of the Roman Pontiff and the Reformation of England, and of many important letters, full of interest for the history of the time, edited by Quirini (5 vols., Brescia, 1744-57).

Bibliography. T. Phillips, *History of the Life of Reginald Pole* (2 vols., Oxford, 1764), the earliest English life and still valuable; A. M. Stewart, *Life of Cardinal Pole* (London, 1882); F. G. Lee, *Reginald Pole, Cardinal Archbishop of Canterbury. An Historical Sketch* (ib., 1888); Athanasius Zimmermann, *Kardinal Pole: sein Leben und seine Schriften* (Regensburg, 1893); James Gairdner, *The English Church in the Sixteenth Century* (London, 1903); Martin Haile, *Life of Reginald Pole* (New York, 1910).

POLE, RICHARD DE LA (?-1525). A pretender to the English crown, the fifth son of John de la Pole, second Duke of Suffolk, and of Elizabeth, the sister of Edward IV. In 1501 he escaped to the Continent with his brother, Sir Edmund, was attainted in 1504 by Parliament, was recognized as King of England by Louis XII in 1512, and fought for France in Spain and the Netherlands. He was excepted from the general pardon of Henry VIII on his accession in 1509. After France and England made peace in 1514 he resided for five years at Metz. In 1523 he made plans to invade England with the aid of the Scots. He was killed in the battle of Pavia at the side of Francis I.

POLE, WILLIAM (1814-1900). An English engineer, musician, and writer on whist. He was born at Birmingham, studied engineering there, became professor of engineering at Elphinstone College, Bombay (1844), and in 1850 was employed in calculations for the Menai Straits Bridge. After acting as assistant to James Meadows Rendel and to Sir John Fowler (q.v.) he entered business independently in 1858, and in 1871 was made consulting engineer of the Japanese government. He was a prominent musician, being musical examiner in London University from 1878 to 1891, and as an authority on whist ranks with Henry Jones. He was the father of a dramatist who changed his name from William Pole, Jr., to William Poel (q.v.). Pole's works are: *On the Strength and Defects of Beams* (1850); *The Theory of Modern Scientific Games of Whist* (1865 and often); *Iron as a Material of Construction* (1872); *The Philosophy of Music* (1877; 4th ed., 1895); *Mozart's Requiem* (1879); *The Philosophy of Whist* (1883 and often); *Life of Siemens* (1888); *The Evolution of Whist* (1895).

POLE, WILLIAM, JR. See POEL, WILLIAM.

POLE AND POLAR. The secant drawn through the points of contact of two intersecting tangents to a conic is called the polar of the point of intersection with respect to the conic, and the point is called the pole of the secant. Any secant of a conic through a given point O is cut harmonically by the curve and the polar of O . Two points are said to be conjugate with respect to a conic when each lies on the polar of the other. Two straight lines are said to be

conjugate with respect to a conic when each passes through the pole of the other. Thus, conjugate diameters are conjugate lines through the centre. When the pole is inside the conic the tangents are imaginary and the polar line fails to cut the conic in real points. In this case the locus of the harmonic conjugate of the pole serves as a more suggestive definition of the polar. If the pole is on the conic the polar becomes a tangent at the pole. The polar of the focus is the directrix in the ellipse, hyperbola, and parabola (qq.v.).

A few of the relations which give remarkable power to the theory of polars in the domain of geometry are: 1. The polars of collinear points with respect to a conic are a pencil of lines passing through the pole of the line, and conversely. 2. If the vertices of a triangle are the poles of the sides of another triangle, the vertices of the latter are the poles of the sides of the former. Such triangles are said to be conjugate to each other with respect to the conic. 3. If the sides of a triangle are the polars of its own vertices, the triangle is called a self-conjugate triangle. 4. The poles and polars of the lines and points of rectilinear plane figures with respect to a coplanar conic form a rectilinear figure called the polar reciprocal of the given figure with respect to the auxiliary conic. The method of reciprocal polars obtains from any given theorem concerning the positions of points and lines another theorem in which straight lines take the place of points and points of straight lines. (See DUALITY.) Thus, a line joining two points in one figure corresponds to a point determined by two intersecting lines in the reciprocal figure. Since the pole of any line through the centre of the auxiliary conic is at infinity, the points at infinity on the reciprocal curve correspond to the tangents to the original curve from the centre of the auxiliary conic. Hence the reciprocal of a conic is a hyperbola, parabola, or ellipse, according as the tangents to it through the centre of the auxiliary conic are real, coincident, or imaginary. Pascal's and Brianchon's theorems are reciprocals (See CONCURRENCE AND COLLINEARITY.) Conjugate lines or conjugate points project into conjugate lines or conjugate points (see PROJECTION), hence the relations of pole and polar are unaltered by projection.

The relations between pole and polar were known to the ancients, but Desargues (1639) was the first to develop the theory. To Servois (1810) is due the name "pole" (in this sense), and to Gergonne (1812) the name "polar." Steiner (1848) also treated the subject exhaustively. Hesse (1837, 1842) introduced the notion of polar triangles, polar tetrahedrons, and systems of conjugate points as the geometric expressions of analytic relations.

The terms "pole" and "polar" have other meanings in mathematics than those already mentioned. The centre from which radii vectores are drawn in a system of polar coordinates (see COORDINATES) is called the pole. The extremities of the diameter of a sphere, perpendicular to one of its circles, are called poles of the circle. If the sides of a spherical triangle are arcs of circles whose poles are the vertices of another triangle, the latter is called the polar triangle of the first. It is shown in geometry that if one triangle is the polar of another, the second is a polar of the first. Consult: for the bibliography of the subject of polars of various orders, Joa-

chimisthal, in *Nouvelles Annales de Mathématiques* (Paris, 1850); for the theory of the subject, Salmon, *Higher Plane Curves* (Dublin, 1852); Reye, *Geometrie der Lage* (2d ed., Leipzig, 1882-86; Eng. ed., New York, 1898); also: Gibson and Pinkerton, *Elements of Analytical Geometry* (New York, 1911); Smith and Gale, *New Analytic Geometry* (Boston, 1912); George Salmon, *Treatise on the Analytic Geometry of Three Dimensions* (5th ed., 2 vols., New York, 1912-15); Dowling and Turneure, *Analytic Geometry* (ib., 1914).

POLE'BURN'. A disease of tobacco (q.v.).

POLE'CAT' (probably from Fr. *poule*, hen + Eng. *cat*; hardly from *Pole* + *cat* or from OF. *pulent*, stinking + Eng. *cat*), or FITCHET. The largest of European martens (*Putorius fectidus*, or more correctly *Mustela putorius putorius*), the length of the head and body being about 18 inches, the length of the tail more than 5 inches, and the form stouter than that of the weasel. Its color is a deep blackish brown; the head, tail, and feet almost black, the under parts yellowish, the ears edged with white, and a whitish space around the muzzle. The hair is of two kinds—a short, woolly fur, which is pale yellow or somewhat tawny, and long, shining, darker hairs. (See Plate of FUR-BEARING ANIMALS.) There is a pouch or follicle under the tail, which exudes a yellowish, creamish substance with a fetid odor; and this odor is particularly strong when the animal is irritated or alarmed. Hence its name fouchart (foul marten), which, with various provincial modifications, is prevalent in most parts of Great Britain.

The polecat was much more common in Great Britain in former times than now, and is almost extirpated from some districts through the constant war waged against it. It eats everything that the gamekeeper wishes to preserve and is extremely destructive in the poultry yard. The ferret, however, is only a semidomesticated race of this species, its natural energies controlled for the pursuit of vermin. The skin of the polecat is used as a fur under the name of fitch, and is similar but inferior to that of the marten. The long hairs, pulled out by the furrier, are utilized for making artists' brushes.

The polecat of North America is the skunk, and that of South Africa is a badger (q.v.).

POLE FLOUNDER. An elongated species of flounder (q.v.), called in Great Britain craig fluke, which is found in rather deep water on both coasts of the Atlantic as far south as France and Cape Cod. It is occasionally taken in great numbers in beam trawls off the coast of New England, and is highly valued as delicate food, perhaps equal to the sole. Its Linnæan name is *Glyptocephalus cynoglossus*. A nearly related species on the Pacific coast is small, thin, and unappetizing.

POLE'EMON (Lat., from Gk. Πόλεμων) A Greek geographer of the second century B.C., surnamed the Periegete. He was born in the district of Troas, but afterward removed to Athens, where he obtained citizenship about 200 B.C. After traveling through Greece he wrote several geographical works, which were almost the first to contain special references to inscriptions, dedications, famous paintings, and public monuments of all kinds. His works are frequently quoted by later writers, including Athenæus and Pausanias. The few extant fragments have been collected by Müller in his *Fragmenta Historicorum Græcorum* (Paris, 1841) and by Preller

(Leipzig, 1838). Consult H. F. Tozer, *A History of Ancient Geography* (Cambridge, 1897), and Christ-Schmid, *Geschichte der griechischen Literatur*, vol. ii, part i (5th ed., Munich, 1911).

POL'EMONIA'CEÆ (Neo-Lat. nom. pl., from Gk. πολεμώνιον, *polemōnion*, a plant, probably valerian, or perhaps named in honor of the Athenian philosopher Polemon or of a king of Pontus of the same name, popularly derived from πόλεμος, *polemos*, war, being alleged to have been the cause of war between two kings), **THE POLEMONIUM FAMILY.** A family of herbaceous dicotyledons containing more than 200 species in about 20 genera and most abundant in western North America. The most familiar genus is *Phlœa*, with about 40 species, many of which are cultivated for their ornamental flowers. The largest genus is *Gilia*, with about 100 species, all of them natives of North America and most of them in western North America. The genus which gives name to the family is *Polemonium*, with about 15 species, one of which is the Greek valerian or bluebell (*P. reptans*). Another conspicuous western genus is *Collomia*, with about 15 species.

POLESIANS, pò-lě'shanz. A brachycephalic people between White and Little Russia, bounded on the north by Grodno and Minsk, on the south by Volhynia, and on the west by Poland. They are isolated in the marshes of Pinsk and along the swamps of the Pripet River and have a cephalic index of 85. The Polesians are supposed to have an infusion of Polish blood, which accounts for their broad heads.

POLE'STAR, or POLARIS. The nearest conspicuous star to the north pole of the heavens. The second-magnitude star which at present goes under the name of polestar is the star α in the constellation of Ursa Minor. By examining attentively the movements of the stars throughout a clear night we observe that they describe circles which are largest for stars near the celestial equator and become smaller and smaller as we approach a certain point (the north pole), close to which is the star above mentioned. The polestar is, however, a little less than $1\frac{1}{2}^\circ$ from the pole, and has a small but perceptible motion around it. (See POLE.) Owing to the motion of the pole of the heavens around the pole of the ecliptic (see PRECESSION), this star will in course of time (about 2100) approach to within 28' from the north pole and will then recede from it. At the time of Hipparchus (156 B.C.) it was 12° and, in 1785, 2° from the north pole. Its place can easily be found in the heavens, for a line drawn between the stars α and β (called the two pointers, from this peculiarity) of the constellation Ursa Major, or the Great Bear, and produced northward for about $4\frac{1}{2}$ times its own length, will almost touch the polestar. Two thousand years ago the star β of Ursa Minor was the polestar; and about 2300 years before the Christian era the star α in the constellation of the Dragon was not more than $10'$ from the north pole, and about 12,000 years from now the bright star Vega in Lyra will be within 5° of it.

The south pole of the heavens is not similarly marked by the neighborhood of a bright star, though there is a small telescopic star very close to it.

POLE VAULTING. See FIELD SPORTS, and Plate of ATHLETICS.

POLHEM, pól'hém, CHRISTOPHER (1661-1751). A Swedish engineer and inventor, called the

Father of Swedish Mechanics. He was born at Visby and studied at Upsala. His invention of an ore-hoisting mechanism caused the King to appoint him director of mine mechanics. During travels in England, Holland, France, and Germany (1694-97) he studied the progress of inventions in those countries. Subsequently he devised many machines for use in transportation, agriculture, mining, and manufacturing. He built docks also, and Charles XII appointed him to construct a canal between the Baltic Sea and Cattegat. For George I of Hanover and England he invented a minting machine to be used at Kassel, and directed improvements in mining methods. Czar Peter I of Russia also sought his services; but most of his work was done for his fatherland. Polhem was knighted by the Swedish King.

POLICE, *pó-lēs'* (from Lat. *politia*, from Gk. *πολιτεία*, *politeia*, government, citizenship, from *πολίτης*, *politēs*, citizen, from *πόλις*, *polis*, city). In its broader significance, the whole internal administration of a state less the judicial power. In a more restricted sense the term "police" denotes that sphere of governmental activity which has to do with the maintenance of the public peace, order, and security, and the protection of the public health and morals. (See **POLICE POWER**.) In this article the use of the term is still further restricted to that part of the state administration which is concerned primarily with the preservation of the peace and the prevention and detection of crime in urban communities. The first instance of the separation of the police magistracy from the judicial magistracy seems to have occurred in France in the fourteenth century. About the same time a military police was organized which eventually became the basis of the present French *gendarmérie*. In Paris a systematic police force soon came to be organized and before the close of the eighteenth century consisted of between 700 and 800 men. In England the police administration was in the hands of the justices of the peace, who had under their control a small number of parish constables. During the eighteenth century several attempts were made to improve the system of London police, but it was not until 1828 that the passage of the celebrated Peel Act established a constabulary force for the city under commissioners appointed by the crown. This has been described as the first modern police force in the world. The act provided for a thoroughly organized and disciplined corps of trained men, a regular day and night patrol, and a force of reserves to be stationed at police headquarters. Although bitterly attacked at the time, the Peel system in its main features was adopted in other cities in England. In New York City, in 1841, the police force consisted of two constables in each of the 17 wards, 100 marshals, 300 night watchmen, 100 wardens, bell ringers, inspectors, and so on. At the same time Boston had 22 day policemen and 200 night watchmen; Philadelphia had 24 day patrolmen and 120 night watchmen. During the first half of the century the control of the police was everywhere in the hands of the local authorities, but beginning with the year 1857 State boards of police commissioners were created for the management of the police in several of the larger cities.

The system of organization of the police force varies widely with different cities. The supreme authority is usually either a single superintendent

ent or a board. In continental Europe the single-headed authority is most common, the *maire* or the *burgomaster* being commonly vested with the immediate control of police affairs. In the United States the same system prevails in most of the smaller cities and in many of the larger ones. In Great Britain the statutes usually require that such boards shall be bipartisan, chiefly on account of the control which the police exercise over the machinery of elections. The superintendent, commissioner, or chief, whatever title he may bear, is the executive head of the police administration and in general is responsible for the character of the police service. For the purposes of police administration a city is usually divided into a number of police districts or precincts. Each precinct has a detachment of police, at the head of which is a captain, who is responsible for the execution of the orders of the chief, and who in turn may issue instructions to those under his command. In the larger cities officers intermediate between captains and superintendents, called inspectors, are frequently provided, and these have control of a certain number of precincts. Next below the captains in the organization are the lieutenants, or, more frequently, the sergeants. Below the sergeants are the roundsmen, who are charged with the duty of seeing that the patrolmen perform their duties. The lowest officer of the police force is the patrolman, whose general duty it is to patrol a given district of territory. In addition to the patrolmen on active duty a number of reserves are usually kept at each station for use in case of emergency. Frequently, as in the public parks and in parts of the city where the posts are unusually long, mounted police are provided, and in the principal ports, as in the case of New York City, there are special harbor police. A frequent and important branch of the police service is the detective bureau, consisting of a force of men employed for their shrewdness and ability to detect crime as well as their knowledge of noted criminals. Unlike the regular patrolmen, they do not wear uniforms. Occasionally, as in the city of New York, there are also special detachments of sanitary police and bicycle squads.

From the standpoint of the relation of the police to the central government considerable variety in principle is to be seen. Thus, in Ireland, Egypt, India, and Australia the police is subject to the strict control of the central government. In Ireland the police force is the Irish constabulary, organized in 1836, consisting of military forces under the immediate control of the central government at Dublin. In Russia the system is thoroughly centralized. Elsewhere in continental Europe the police administration is either directly or indirectly under central control. It is a general practice in Europe for the central government to defray a part of the cost of administering the police. In Berlin the amount granted by the central government is four-fifths of the cost; in London and Paris, one-third. The borough and county police of England receive a parliamentary grant, amounting to one-half of the cost of maintenance, provided a given standard of efficiency is maintained. In American cities the entire cost of its police is defrayed by the municipal government.

In most of the European countries a state police is maintained and is under the immediate control of the central government. It is gen-

erally modeled after the French *gendarmerie*, which is a part of the regular army. In Russia the secret police is largely concerned with the suppression of political agitation. Although locally selected, police officers in the United States are regarded by the courts as State agents and not agents of the municipalities, and the municipalities cannot be held liable for the tortious acts of its police officers.

Fosdick, *European Police Systems* (ib., 1915).

POLICE, MILITARY. See MILITARY POLICE.

POLICE COURT. An inferior court of criminal jurisdiction, usually established in a borough, city, or large town by legislative authority, for taking the statements of persons arrested for crime and for the summary disposition of petty offenses. The judge of a police court usually has the powers of an examining and committing magistrate. In the United States such courts are often known as magistrates' courts or municipal or justices' courts. See COURT; JUSTICE OF THE PEACE; MAGISTRATE.

POLICE MAGISTRATE. See MAGISTRATE.

POLICE MATRONS. Women who have charge of women and children in police stations, jails, and other places where they are detained. Elizabeth Fry (q.v.) first called attention to the deplorable condition of women in prisons and insisted upon the principle that none but women should be employed in the superintendence of women. The Society for the Improvement of Prison Discipline demanded police matrons in 1823, and the National Prison Congress cited their appointment as a requirement of prison reform in 1886. The impropriety of allowing men to search women and to care for their physical wants has only recently been recognized in the United States. The reform has been instituted entirely by women, usually Woman's Christian Temperance Union workers. In Portland (Me.) and Indianapolis associations of women provided for police matrons at their own expense before the office was established by law. Portland (Me.) first established the position of police matron in 1876. Chicago, Baltimore, Cincinnati, and Philadelphia employed them at a later date. They are now required for the larger cities in a number of States. The movement has made marked advance since 1890.

POLICE POWER. The inherent power of a government to take such action and to pass such laws as may be deemed necessary for its own protection and to secure the safety, comfort, and general welfare of its citizens. It is difficult to define the precise limits of the police power of a government, and probably there are no absolute limits except that it shall only be exercised for the purposes above mentioned and under such restrictions as may be imposed by a fundamental law or constitution. Chief Justice Shaw of Massachusetts defined it as "the power vested in the Legislature by the Constitu-

tion to make, ordain, and establish all manner of wholesome and reasonable laws, statutes, and ordinances, either with penalties or without, not repugnant to the Constitution, as they shall judge to be for the good and welfare of the commonwealth and of the subjects of the same." While governments have always assumed to exercise the powers above mentioned, the law and theory of the police power as a justification and authority for otherwise arbitrary and despotic acts have been a growth of the nineteenth century in the United States. In some respects the police power is more arbitrary than that of eminent domain. By virtue of the latter a government may take private property only upon making proper compensation therefor, whereas if property is confiscated or destroyed for the public good under the police power no reimbursement need be made to the owner. This distinction exists in practice even in England, where the police power may be exercised by Parliament without the constitutional restrictions by which it is limited in the United States. It is only in this country and to a lesser extent in the self-governing colonies of Great Britain that the judicial definitions of the police power constitute a part of the law of the Constitution.

In the United States the police power of the national government rests upon the general and specific grants of authority vested by the Constitution in the several departments of the government, especially in the Congress. The more general grants of power, as the power of Congress to provide for the general welfare of the United States, are restricted by various provisions drawn from the English Bill of Rights (q.v.) or from the political experience of the English and American peoples. In the several States, on the other hand, the police power rests upon the general legislative authority, which is unlimited except as restrained by express provisions contained in the Federal Constitution or in that of the State whose power is in question.

As the police power of the national government and of the several States lies between these limits of general governmental authority and specific constitutional restrictions, it follows that the law of the subject rests upon the legislation in which the scope and meaning of the restrictive provisions have been tested and on the judicial decisions of the Federal and State courts in which they have been examined and defined. There can evidently be no law of the police power in a country like England, where the governmental, and especially the legislative, authority is entirely unrestrained by a fundamental law.

As above defined, the police power is practically identical with governmental power. In recent practice, however, the term has come to be restricted to a limited area of the power of government, and especially to the following classes of cases: (1) legislation designed to promote the social welfare, i.e., the public health, public morals, public safety, and public order and comfort; (2) legislation designed to promote the economic interests of the community, as in the protection against fraud, protection against oppression, and the like; and (3) administrative measures designed to secure these ends.

Among the numerous laws and regulations of the various States which have been held to be within the legitimate exercise of the police power are acts requiring railways to fence in their tracks; requiring signboards at crossings; regu-

lating the speed of trains; regulating the charges of persons in quasi-public occupations, as warehousemen, cab drivers, ferry owners, etc.; regulating the storage of explosives and the sale of poisons and of liquor; prohibiting the adulteration of foods; regulating the hours and conditions of employment of women and children; providing for compensation to employees for injuries sustained in the course of their employment; requiring the quarantine of infectious diseases and the destruction of infected houses and property; and the licensing of physicians, druggists, engineers, etc. Laws prohibiting labor and enforcing quiet on Sunday have been held not to encroach on the religious liberty of individuals, but to be a valid exercise of the police power for the general welfare of the community. The tendency of recent decisions in the State as well as in the Federal courts has been to give an enlarged construction to the police power, whether exercised by Congress or by State Legislatures, and where the courts have, as in some recent instances, retarded this process, it has been aided by constitutional amendment.

POLICY (Fr. *police*, It. *polizza*, from ML. *politicum*, *poletum*, *poleticum*, *polyptycum*, register, from Gk. *πολύπτυχον*, neut. sing. of *πολύπτυχος*, *polyptychos*, having many folds or leaves, from *πολύς*, *polys*, much, many + *πτύξ*, *ptyx*, fold, leaf, from *πτύσσειν*, *ptyssein*, to fold). 1. A method of gambling resembling the ordinary lottery in that slips, on which are printed numbers and usually some name or device for identification, are given out to the players and corresponding numbers on slips are intermingled in some receptacle and drawn out by a blindfolded person. The players usually make bets upon the order in which numbers in a certain sequence will appear. Although the odds given the players are very alluring, the chances of winning are actually very much against them. Usually very small bets will be received, and for this reason this method of gambling has spread among the poorer classes, especially in the larger cities. Gambling of this form is prohibited in nearly all of the United States, either under the specific name of policy or under the more general term of lottery. The United States postal laws prohibit the mailing of advertisements or tickets of policy shops, and for this reason most establishments of this sort operate in a limited locality and with some attempts at secrecy. See GAMBLING; LOTTERY.

2. The written contract by which a person undertakes to insure another against the happening of any event, or to pay him a certain sum upon a certain contingency, is called a policy. The policy is frequently designated by some qualifying word, as "tontine," "endowment," or the like, according to the nature of the insurance undertaken. See INSURANCE.

POLIDORO (CALDARA) DA CARAVAGGIO, pò'lè-dò'rò dà kà'rà-và'jò (c.1495-1543). An Italian painter and decorator of the High Renaissance. His real name was Caldara and he was born at Caravaggio, near Milan. Coming to Rome as a youth, he obtained employment as a mason upon the Vatican constructions in progress under the direction of Raphael. He received instruction in painting from Maturino, a Florentine, in conjunction with whom he executed a great number of decorations in *sggraffito* (q.v.) upon the façades of Roman palaces, which have mostly perished, but which are well known from engravings. The sack of Rome in 1527 and the death of Maturino drove Polidoro to Naples, where he developed a realistic but florid and coarse style, which exercised great influence on the character of the Neapolitan school. The picture most typical of his last phase of his art is "Christ Bearing the Cross" (1534), in the Museum of Naples. He afterward went to Messina and acquired high standing and wealth, but was assassinated there in 1543. Consult Bertolotti, *Artisti lombardi a Roma* (Milan, 1881).

POLIESSIE, pò-lyé'syé (Russ., wooded region). A marshy region in the west of Russia, comprising the larger part of the Government of Minsk, the northern part of Volhynia, the eastern part of Grodno, as well as portions of the governments of Mohilev and Kiev. It is thickly wooded and is noted for its unhealthy climate. A considerable area has been drained by the government since 1873, and the reclaimed regions yield good crops of hay.

POLIGNAC, pò'lè'nyák'. An ancient French family, several of whose members played a prominent part at court after the time of Louis XIV.—MELCHIOR DE POLIGNAC (1661-1742) was born at Puy-en-Velay in the Department of Haute-Loire. He was destined by his parents for an ecclesiastical career and received an excellent education. In 1693 he was sent to Poland as Ambassador, and intrigued so successfully in favor of the Prince de Conti (q.v.) that the latter was actually elected John Sobieski's (q.v.) successor in 1697. Augustus the Strong, however, proved the successful aspirant to the throne, and both Conti and Polignac had to leave Poland, in consequence of which the latter retired to his abbey at Bonport. In 1702 he was recalled to Versailles, and rose higher than ever in the royal favor. In 1712 he was appointed French Plenipotentiary at the Congress of Utrecht, and after his return obtained the abbeys of Corbie and Anchin. During the regency Polignac took part in the conspiracy of Cellamare and was banished to his abbey of Anchin. In 1725 he was sent to Rome, charged with the conduct of French affairs, and signalized his mission by healing the quarrel that was dividing the Gallican church on the subject of the famous bull *Unigenitus*. (See JANSENISM.) In 1725 the King raised him to the archbishopric of Auch, and on his return to France he spent the remainder of his days in retirement. Polignac succeeded Bossuet at the Académie Française in 1704, and was also a member of the Académie des Sciences and of the Académie des Belles-Lettres.

The other members of the Polignac family who deserve mention are connected with the last phases of the Bourbon monarchy in France. In the reign of Louis XVI Yolande Martine Gabrielle de Polastron, Duchess de Polignac (1749-

93), and her husband, Jules, Duke de Polignac (died 1817), were among the most intimate and favored advisers of Marie Antoinette. They obtained vast sums of the public money from their connection with the court, and were largely if not mainly responsible for the extravagance which marked the eve of the Revolution. The Polignacs, knowing the deep hatred felt towards them by the French people, were the first of the noblesse to emigrate (July 16, 1789). From the Empress Catharine II of Russia, the duke received an estate in the Ukraine, and did not return to France at the Restoration. He left three sons, of whom only one deserves notice—JULES AUGUSTE ARMAND MARIE, Prince de Polignac, born at Versailles, May 14, 1780. In 1804 he entered with his brother into a conspiracy against Napoleon, and both were imprisoned, but escaped when the allies entered France in 1814. After his return to Paris Polignac became intimate with the Count d'Artois, afterward Charles X, showed an ardent attachment to the Roman Catholic church, and in consequence received from the Pope, in 1820, the title of a Roman prince. The King appointed him Ambassador at the English court in 1823, and finally, in 1829, he became head of the last Bourbon ministry, in which capacity he promulgated the fatal ordinances of July, 1830, that called France to arms and drove Charles X from the throne. (See JULY REVOLUTION.) He then attempted to flee the country, but was captured at Granville, tried, and condemned to imprisonment for life in the fortress of Ham, but was afterward set at liberty by the amnesty of Nov. 29, 1836. During his captivity he wrote *Considérations politiques*. He later took up his residence in England. He died at Saint-Germain, March 2, 1847.

Consult, for Melchior de Polignac, Faucher, *M. de Polignac* (Paris, 1777), for Jules de Polignac and Yolande de Polastron, W. Schléssinger, *Les femmes du XVIII^e siècle: La duchesse de Polignac et son temps* (ib., 1889).

POLILLO, pō-lē'lyō A group of islands in the Philippines, lying about 30 miles east of the Province of Infanta, Luzon, and connected for administrative purposes with the Province of Tayabas (Map: Philippine Islands, D 3). The area of the group is 421 square miles and that of the chief island (Polillo) is 333 square miles. The latter had in 1903 a population of 2224, nearly all of it in the town bearing the name of the island.

POLIOMYELITIS, pōl'i-ō-mī'ē-lī'tīs (med. term, from Gk. *πολιός*, *polios*, gray + *μυελός*, *myelos*, marrow + *-itis*), INFANTILE SPINAL PARALYSIS. An inflammation of the gray matter of the spinal cord. (See NERVOUS SYSTEM AND BRAIN.) Acute anterior poliomyelitis is an inflammation of the anterior horns of the spinal cord, rarely found in adults, but oftener in children, and followed by a flaccid paralysis, later by atrophy of one or more muscular groups. When occurring in children it is known also as infantile paralysis.

History. Attention was called to this disease first by an epidemic of it in Norway in 1868 and again by one in Sweden in 1905. Since then epidemics have appeared in Europe as well as in North and South America (United States, Canada, and Brazil). The disease seems to be universal, and medical research has been called upon to eradicate the malady and to educate the physician to diagnose and treat it correctly.

To this movement the increasing number of reported cases may be attributed rather than to a general spread of poliomyelitis. The Rockefeller Institute in New York has led the medical profession in the study of this disease, with these investigators: Simon Flexner, Lewis, Noguchi, and Amoss. Other important names are: Von Behring, Popper, Levaditi, Kling, Wernstedt, Petterson, Römer, and Pierson.

Etiology. It is only since 1909 that we have known that acute anterior poliomyelitis is an infectious disease. It has been found that the virus belongs to the class of filterable organisms, but up to the present it has not been rendered certainly visible. The virus has been demonstrated in the spinal cord, bulb, brain, spleen, bone marrow, blood, and cerebrospinal fluid, and also in the mucous membrane of the nasopharynx and its secretion, in dust, on handkerchiefs, etc. The mode of entrance into the human body is still under discussion. As the disease can be produced in the monkey (from man or from monkey), guinea pig, rabbit, and dog, the suspicion has gained ground that it could be transferred from a domestic animal to man by blood-sucking insects or by nasal and oral secretion. Bedside observations seem to support this idea, especially in the case of the epidemic among the Indians of Central Alaska, near the Yukon River, in 1913. Laboratory experiments do not corroborate this view. The great difficulty of infecting monkeys by direct introduction of the virus into the blood seems to have brought about a change of opinion. The infection, even from very large doses of virus injected directly into the blood circulation, is much delayed. The virus is promptly deposited in the spleen and bone marrow, but not in the kidneys, spinal cord, or brain. It is not taken up from the blood by the spinal cord and brain until the choroid plexus and the walls of the blood vessels have suffered injury. Infection is quickly produced by direct introduction of the virus into the brain, subarachnoid spaces, or peripheral nerves. The accepted theory, therefore, seems to be that the poliomyelitic virus enters the body through the upper respiratory passages, especially through the nasopharyngeal tissues, whence it may pass through the lymphatic channels surrounding the filaments of the olfactory nerve to the leptomeninges, and thus reaches the cerebrospinal fluid. Finally, experiments to produce poliomyelitis through transmission of the virus by bloodsucking insects have not so far been successful.

Attack. The prodromal stage of the attack varies from 1 to 10 days. The attack usually begins with a coryza, followed by bronchitis and gastrointestinal disturbances, sometimes with fever and a profuse perspiration, with severe pains in the limbs, leaving a paralysis which may, especially with proper attention, in the most favorable cases, be somewhat relieved, after perhaps years of treatment; but in other cases the paralysis will be followed by atrophy and retarded growth of the limb. Death occurs from paralysis of the muscles of respiration or of the alimentary canal.

Treatment. The patient is kept quietly in bed for a considerable time, but careful movement of the affected limb is soon instituted; the treatment proper consists of lumbar puncture, withdrawal of the cerebrospinal fluid, and injection of virus serum in smaller quantity than the amount of fluid withdrawn. The after treat-

ment consists of fresh air, electricity, massage, exercise, correction of muscle action, etc.

Prophylaxis. Prophylaxis must pay special attention to cleanliness and disinfection by nasal and mouth and throat sprays, destruction of secretion, and isolation.

Epidemic. As to the occurrence of an epidemic of poliomyelitis, the reports from physicians and health boards come nearly all to the same conclusion. An infection that may have been latent for years flares up suddenly, independent of weather conditions, without discoverable specific cause, attacking about one in 1500 of the population, mostly children.

Statistics. Thirty-two States require that the health authorities be notified of cases of infantile paralysis.

DEATHS FROM POLIOMYELITIS WITHIN THE
REGISTRATION AREA IN THE UNITED
STATES

YEAR	Number of deaths	Death rate for 100,000 inhabitants
1909	569	1.1
1910	1459	2.7
1911	1060	1.8
1912	1136	1.9

Of the 1136 deaths in 1912 there were 737 of children under 5 years, 164 of children between 5 and 9 years, 71 of children between 10 and 14 years, 43 of patients between 15 and 20 years, and 121 of patients over 20. In 1909 were reported 2500 cases with 569 deaths and, in 1910, 7095 cases with 1459 deaths. The mortality from infantile paralysis is variously stated. Krause, of Germany, gives the following percentages for 1911: New York, 5; Norway, 14.56; Sweden, 16.7; Austria, 22.3. Potpeschnigg, of Austria, found in 1909 in Styria (in a population of about 1,750,000) 600 cases of infantile paralysis, with a mortality of 7.51 per cent of children under 14 years and 24.25 per cent of patients over 14. In Pennsylvania were reported, in 1911, 773 cases—437 males (2 colored), 336 females (1 colored). Forty-four cases developed in families where another member had been first attacked; 18.4 per cent (142 patients) recovered without paralysis; 71.6 per cent (294) suffered from after effects. Hold, in 1911, observed 300 children under 3 years, and found that 70 per cent of the patients, apart from an epidemic, were tuberculous.

The acute form in adults runs much the same course, but the cases are more severe and more often end fatally. Chronic anterior poliomyelitis is found mostly in adults, very rarely in children. It shows a slowly developing atrophy, with long periods of quiescence and even apparent improvement. Treatment is the same as in infantile paralysis—electricity, massage, exercise, carefully and properly applied. But the prognosis is not so good, and death usually takes place from atrophy of the muscles of respiration. Consult: Peabody, Draper, and Dochez, *Monograph No. 4, Rockefeller Institute for Medical Research* (New York, 1912); Flexner, Clark, and Amoss, *A Contribution to the Pathology of Epidemic Poliomyelitis* (ib., 1914); Saunders, Meisenbach, and Wisdom, *The Causation and Prevention of Infantile Paralysis* (St. Louis, 1914); Frauenthal and Manning, *A Manual of Infantile Paralysis* (Philadelphia, 1914). See MUSCLE, DISEASES OF.

POLIORCETES, pól'i-ór-sé'téz. See DEMETRIUS I, Macedonian King.

POLISH CATHOLIC CHURCH IN THE UNITED STATES. See INDEPENDENT CATHOLIC CHURCH IN THE UNITED STATES (POLISH).

POLISH FOWL. A variety of poultry traceable as far back as the sixteenth century under many names. These fowls are bred in the United States mainly on account of their handsome plumage, the most striking feature of which is a great globular crest, or topknot, which envelops the entire head. See Colored Plate of FOWLS, accompanying article POULTRY.

POLISHING MATERIALS. See ABRA-SIVES.

POLISH LANGUAGE. A language belonging to the western group of Slavic languages (q.v.) and occupying the second place in importance in that family. It is spoken by about 15,000,000 persons in those parts of Russia, Austro-Hungary, and Prussia which constituted the former Kingdom of Poland and by more than 1,000,000 persons in America. Of the many Polish dialects the following are the most important: Great Polish, in Posen and in portions of the governments of Kalisz and Plock; Little Polish—the most euphonic—in Galicia (Cracow and Lemberg being the centres); Masurian, or Masovian—in East Prussia and in the north-eastern part of the Polish Kingdom (Warsaw the centre); Lithuanian Polish, used by Mickiewicz and other writers; Prussian and Silesian Polish—full of Germanisms. The Kashubian and Slovincian, although sufficiently distinct from Polish proper, are sometimes considered as dialectal varieties of that language. The earliest literary monuments in Polish do not go further back than the fourteenth century. In its historical developments the Polish language underwent many outside influences. The introduction of Christianity (c.965) brought Latin to the front at the expense of the native tongue, while the numerous German settlers introduced German words for articles of everyday life. The Reformation brought the language of the country into Church use. For about two centuries the macaronic literature (a mixture of Latin and Polish) prevailed. The pseudo-classical period brought the mania for everything French and with it the adoption of numerous Gallicisms. It was reserved for the Romantics to purify the Polish language; and their traditions are still kept up by many purists in a struggle against the inroads of Russian technical terms and of Germanisms.

Although the combinations of sibilants in Polish look formidable on paper, they are soft in pronunciation: *sz* = *sh*, *cz* = *ch*, *rz* = *zh*, or *sh* after consonants. Besides the phonologic characteristics mentioned in the article SLAVIC LANGUAGES the following features of the Polish language may be mentioned: 1. Seven cases in nouns—nominative, genitive, dative, accusative, vocative, instrumental (ablative), and locative (prepositional). 2. Loss of the dual (in nouns and verbs), of which traces are still to be found, however, in various dialects. 3. All futures are compound; the simple preterites have all been lost, and periphrastic forms now take their place. 4. Invariable accentuation on the penult, which is a later substitution for the original Slavic free accent. In power and variety of expression the Polish language fairly rivals Russian.

Bibliography. **DICTIONARIES.** In Polish:

Linde, *Dictionary of the Polish Language* (8 vols., 2d ed., Lemberg, 1854-60); *Dictionary of the Polish Language*, edited by seven Polish scholars (2 vols., Vilna, 1856-61), fuller than the preceding but not so scientific; and the great dictionary of Karłowicz, Kryński, and Niedzwiedzki, published at Warsaw (1900-). In other languages: A. E. B. Chodzko, *Complete English-Polish and Polish-English Dictionary*; Friedrich Boock-Arkossy, *Neues Vollständiges polnisch-deutsches und deutsch-polnisches Wörterbuch* (6th ed., 2 vols., Leipzig, 1893); id., *Polnisch-deutsches und deutsch-polnisches Wörterbuch* (8th ed., ib., 1899); Kierst and Callier, *Pocket Dictionary of English and Polish* (2d ed., ib., 1906).

GRAMMARS. In Polish: Malecki, *Grammar of the Polish Language* (Lemberg, 1863), excellent; id., *Comparative Historical Grammar of the Polish Language* (ib., 1879), superseded by that of Kryński (3d ed., Warsaw, 1903); id., *Grammar of the Polish Language, Briefer Course* (ib., 6th ed., 1882); Malinowski, *Comparative Critical Grammar of the Polish Language* (Posen, 1870; and supplement, 1873); Kalina, *Grammatical Forms of the Polish Language to the End of the Eighteenth Century* (Lemberg, 1883, unfinished), most valuable. In Russian: Baudouin de Courtenay, *The Old Polish Language* (Leipzig, 1870). In other languages: Smith, *Polnische Grammatik* (2d ed., Berlin, 1863); W. R. Morfill, *A Simplified Grammar of the Polish Language* (London, 1884); Vymazal, *Grammatik der polnischen Sprache zunächst zum Selbstunterricht* (Brünn, 1884); Poplinski, *Elementarbuch der polnischen Sprache* (14th ed., Leipzig, 1893); Asmus Soerensen, *Polnische Grammatik* (ib., 1900).

POLISH LITERATURE. The "popular" literature of the Poles falls into two main divisions: (1) lyric and (2) epic. The first, although expressing the sadness of the race, oftener treats of themes of boundless merriment and the joy of life. The second group consists of tales, animal epics, apologues, religious legends, and finally a few historical tales. The moods are definite and calm, strong realism intermingled with humor being the rule. These are embodied in numerous adages, proverbs, and sayings—the whole philosophy of the nation. The best collections of material on this popular literature are *Adalberg's Book of Polish Proverbs* (Warsaw, 1894) and the monumental work of Oskar Kolberg, *The People: Its Customs, Manners, Language, Traditions, Proverbs, Usages, etc.* (Warsaw, 1865-98), of which 23 volumes have so far appeared.

Written Literature. Earliest Times. With Christianity (c.965) came also the rejection of everything national as reminiscent of heathenism. The indigenous letters were replaced by the Latin alphabet, and all studies in the schools had for their sole object the mastery of the Latin language. In the thirteenth century education was extended, and more than 120 different schools are known to have existed in the period of 1215-1364. But the Polish scholars writing in Latin are in no way representative of the Polish nation.

The literary remains of this period to the end of the fifteenth century fall into three groups: (a) *Scientific.* Annals and Chronicles of Martin Gallus (1110-35), quite fantastic in subject matter, but unaffected in style and humorous; Wikenty Kadlubek (1160-1223), in most arti-

ficial and labored mediæval Latin; the journeys of the Franciscan Carpini (Giovanni di Piano) and Benedict Polacus to the Tatar Khan Hayuk in the thirteenth century. The *Historia Poloniæ* of Jan Długosz (1415-80), Bishop of Lemberg, in 12 volumes, is a remarkable result of more than two decades of independent research, and is animated by strong patriotism and written in artistic style. (b) *Didactic.* Sermons, though delivered in Polish, were written in Latin, to give them a wider circulation abroad. They contain much anecdotic material, important for the history of literature, as well as accounts of current superstitions and ethical instruction valuable for the history of Polish morals. (c) *Poetic.* These are very few; most of the extant manuscripts contain mediæval translations of the classics. Of the Polish poems preserved in Gallus, Wikenty, and Długosz, many are poetic in spirit and feeling, though crude in form. Of these the earliest and most remarkable specimen is the famous "Battle Hymn to the Virgin" (*Bogurodzica*), ascribed by tradition to St. Wojciech (Adalbert) of the tenth century. Other specimens are: the *Psalter of Queen Margaret*, in a manuscript of the fourteenth century, also called *Florian Psalter*; a prayer book of the year 1375; a polish translation of the fiftieth Psalm; the Gnesen sermons; the Bible written for Queen Sophia (1455). Some Polish statutes and religious hymns belong to the fifteenth century.

During this period humanistic ideas gained ground. The number of schools increased rapidly to satisfy the great demand for study among the laity. The contest between scholastics and humanists, raging in other parts of Europe, was carried on also in Poland. Andrzej Halka's *Eulogy of Wiclif* proves that literature was becoming a means of religious propaganda.

In the sixteenth century the Polish language was gradually superseding Latin. The first book in Polish was printed in 1521 (*The Discourse of King Solomon*), and this is commonly taken as the beginning of the new golden period of Polish literature. A Protestant translation of the Bible appeared at Brześć (Brest-Litovsk) in 1553. The great names of this period are: Mikolaj Rej of Naglowice (1505-69), who gives in his poems vivid pictures of contemporary manners, typical studies in character, and fine descriptions of scenery; the fiery and eloquent Catholic Peter Skarga (1536-1612); and Jan Kochanowski (q.v.) (1530-84), best known by his *Psalms*. His *Laments* (on the death of his daughter Ursula) are characterized by depth and sincerity of feeling and perfection of form. His *Jests* are rollicking with fun or bitter with satire. His dramatic effort (*Departure of the Greek Envoy*) was the pioneer in Polish drama. The names most closely allied with his are those of Szarzyński, Grochowski, Peter Kochanowski, Szymonowicz, and Sebastian Klono-wicz (1545-1602), a keen satirist, but not a poet, and Stanislas Orzechowski (1515-66), who perfected the Polish language in his publicist writings.

The only poet of merit that the seventeenth century produced was Maciej Kazimierz Sarbiewski (1595-1640), a writer of Latin poems. The exhaustion of the poetic vein brought about the so-called macaronic period of Polish literature. The only valuable achievements were the increasing number of translations of European poets. A theatre was established by Ladislas IV, where English, French, and Italian actors

appeared. Native mysteries had been presented, such as Rej's *Joseph*. All were very poor, the best being those of Andrzej Morsztyn, but even he was more an imitator of French and Italian models than a creative poet; his translations of Corneille's *Cid* and Tasso's pastoral drama *Aminia*, however, were excellent. Wacław Potocki's *The War of Khotin*, discovered in manuscript in 1850, is a powerful realistic poem, more striking when contrasted with the general barrenness of the period. The first half of the eighteenth century served to emphasize the dangers arising from internal disorders. Martin Matuszewski (1714-65) gave vivid pictures of the moral depravity of the times. Warning voices were heard against the licentiousness of the nobility (Karwicky) and the *liberum veto* (Konarski).

Period of French Pseudoclassicism (1750-1822). The weak King Stanislas Poniatowski was a man of high culture and strong æsthetic leanings. A philosophical reaction succeeded Catholicism, and French ideas triumphed. The consciousness of social evils prompted the writers to expose them in satire and fable, while virtuosity of form was the chief object in this anxiety to imitate the French models. Trembecki (1723-1812), Wengerski (1755-87), and Krasicki (1735-1801) armed themselves against the reigning inertia, barbarous prejudices, and foolish imitation of foreign manners. Bishop Naruszewicz fell below these three in poetic gifts, but, being a historian, surpassed them in breadth of view; his satire was more bitter, he felt more keenly the demoralization of society. Comedy flourished, and the first political comedy in Polish, *The Envoy's Return*, by Niemcewicz, enjoyed great success. The greatest name in pseudoclassical drama is that of Alexander Fredro (1793-1876), who wrote much later, but really belonged to this period. His plays are among the gems of the Polish stage, owing to the beauty and purity of the language, the genuine wit, the live types, and the unflagging interest of the action. Along with this satirical current the sentimentalist movement found strong representatives in Krasicki, Karpiński, and Książnin, the first being especially popular. The final partition of Poland (1795) brought a wave of patriotism. Hence the success of Niemcewicz's *Historical Ballads* (1816). Dramas cropped up in answer to the same demand for and interest in everything historical.

Romanticism (1822-62). Romanticism, which placed feeling above reason, answered the condition of Poland. *The Ode to Youth* of Mickiewicz struck a responsive chord in the hearts of his countrymen. From such feelings proceeded the love for the miraculous (destined to develop into mysticism a little later) and national folklore abounding in it. The educational reforms of Czacki and Czartoryski brought more learning; the poets sought recognition from their people as a whole, and not from personal patrons. The lyceum at Krzemieniec, with its inspired historian Lelewel poetically reproducing the ancient times, turned out a score of students who became the disseminators of romanticism in their poetical and critical works, all of which aimed at creating a national poetry. Among the various factors in this literary movement the so-called Ukrainian (Little Russian) school was the most prominent. Among its representatives Malczewski (1793-1826) was the bard of the nobility; Zaleski (1802-86) glorified free

Cossackdom; Goszczynski (1803-76) sang with epic simplicity the customs and beliefs of the Haidamaks. Zaleski's poems, appearing in 1822, passed unnoticed. A few months later another collection of poems appeared, and from these the period of romanticism was dated. They were by Adam Mickiewicz (q.v.) (1798-1855), the greatest name in Polish literature. They exposed the author to attack from the adherents of pseudoclassicism, but soon these were either turned into romantics or were silenced. Before long the opposition to the romantic movement resulted in the exile of Mickiewicz and others, and almost all the poets then emigrated. Closely allied with Mickiewicz were poets of nearly equal power, as Krasinski (q.v.), who began with universal ideals (in his *Undivine Comedy*) and then narrowed down to pure nationalism (in *Irydion*, *Dawn*, and *Psalm of the Future*). Unlike him Slowacki had a definite purpose. Being a pronounced democrat, he endeavored to trace in a series of poetic works the democratic tendencies in the culture and political development of Poland. Around these three great poets gathered a number of lesser lights like Zan, Garczynski, Witwicki, Gorecki, Odyniec, and others. But soon the leaders became mystics. Slowacki's poems became so misty and involved that they were no longer understood. However, the clouds of mysticism passed away, and a more speculative and calm attitude towards reality set in among the workers. Wikenty Pol represented the past in an ideal light, Sigismund Kaczkowski and Rzewuski ably seconding him in his efforts. Ludwik Kondratowicz (1823-82; pseudonym Władysław Syrokomla), in his stories in verse, was the inspired singer of the aspirations of peasants and the small bourgeoisie. Lenartowicz (1822-93) took his themes from popular legends, preserving their simplicity in a delicate poetic form. After the apathy immediately following the revolution of 1830-31 wore away, a group of enthusiasts grew up, who wanted another revolution. Among the poets, who, with the exception of Pol and Kondratowicz, were all for revolution, Ujejski in his *Biblical Melodies* and *Jeremiah's Lament* described Poland under the name of Judæa, and his *Choral* became the national anthem. This period of storm and stress evolved two distinct currents of political and philosophical thought in Polish literature: one turbulent (poetry) tending towards revolution, the other calm (novel and romance), towards gradual evolution. The novel, which was originally purely sentimental, received its high state of perfection at the hands of Kraszewski (q.v.) (1812-87).

Modern Period (1862-1900). Kraszewski reflected in his writings all the various currents of thought, ever seeking the "golden mean." Josef Korzeniowski was a deeper psychologist and preached more progressive ideas, especially combating the prejudices of the nobility. Among those who idealized reality, Chodźko, Czajkowski, and the poetess Jadwiga Łuszczewska may be mentioned. Zygmunt Milkowski (pseudonym Jeż) was an energetic champion of democratic ideas even in his historical novels, and Zachariasiewicz with Plug (pseudonym of Pietkiewicz) followed closely in his steps. This period was in the beginning very similar to that subsequent to 1831, only the hope for restoration was weakened still more. The characteristic feature was the growth of the periodical

press, which soon took the lead in the spiritual life of Poland. Books were printed in cheap editions in great quantities, to supply the demand for them among the masses. Positivism, economic questions, the material and spiritual welfare of the country were now of paramount importance. The chief organs for spreading these views were the *Weekly Review* and *Truth*, of the monthlies, the *Athenæum*, representing the progressive elements, the *Warsaw Library* being the mouthpiece of the conservatives. About the middle of the seventies the strife between the two camps lost a good deal of its bitterness. In the three parts of the former Poland all efforts are directed towards the moral and intellectual uplifting of the masses, with the Warsaw weekly, the *Voice*, as champion of the people's rights. All these economic, political, and philosophical tendencies have found expression in literature, lyric poetry being least influenced by the various currents of thought. At the head of lyric poets stand Adam Asnyk (1838-97), master of form, and the passionate Tetmayer. Marya Konopnicka pleads the cause of the downtrodden and oppressed in her lyrics, and she is famous for her short stories. The two writers mentioned have distinguished themselves in the department of drama also. Wiktor Gomulicki is the poet of nature and feeling, possessing an unusually tender and expressive style. The comedy of the present day deals chiefly with social questions in a light, satirical way. It is lively and witty, the situations are natural, and the action is interesting and rapid. The most prominent writer of comedies is Fredro the younger. Historical dramas, written by Szujski and others, are not very numerous, and are not so well liked by the public as dramas of manners and social questions. Among the writers of modern dramas Aleksander Śwentochoński, Wacław Karzewski, and Rabski hold an important place. The chief characteristics of the modern novel are a highly perfected technic and great variety in the subjects, the characters depicted, and the tendencies of the authors. For these reasons the modern Polish novel is more fully representative of the epoch than is drama or poetry. Its brightest names are Sienkiewicz, Bolesław Prus, and Eliza Orzeszkowa. Of the latest writers Klemens Junosza has drawn in a plastic and humorous style the life of peasants, Jews, and the small nobility; Ignacy Maciejowski also depicts peasant life; Balucki lashes the shortcomings of the contemporary Polish nobility; Dygasinski deals with life in the country; Szymański and Sieroszewski (Sirko) depict Siberian life; Zeromski introduces us to the life of the *bohème*. Several rather unsuccessful attempts have been made to introduce novels in the style of the French naturalistic school (although some novelists, like Reymont, exhibit undeniable talent), while other writers try to keep up the traditions of Kraszewski. The periodical *Life*, founded in Cracow in 1897 by Ludwik Szczepański, is the organ of this so-called Young Poland, Stanisław Przybyszewski being the literary leader. Other notable poets are the symbolists Wyspiański and Przymycki (Niriām); some, like Rydel and Kasprzowicz, are also dramatists of great force.

Bibliography. In Polish: Wiszniewski, *History of Polish Literature* (10 vols., Cracow, 1840-57); Maciejowski, *Polish Literature* (3 vols., Warsaw, 1851-53) (both reach only to the middle of the seventeenth century); Kon-

dratowicz, *History of Literature in Poland* (Vilna, 1851-54); Zdanowicz-Sowiński, *Outline of the History of Polish Literature* (ib., 1874-78); Bartoszewicz, *History of Polish Literature* (Cracow, 1877); Dubiecki, *History of Polish Literature* (Warsaw, 1889); Biegeleisen, *Illustrated History of Polish Literature* (Vienna, 1898-1913); Chmielowski, *History of Polish Literature* (6 vols., Warsaw, 1900); id., *Modern Polish Drama* (ib., 1902); Tarnowski, *History of Polish Literature* (Cracow, 1900-05); and many others. The exhaustive *Polish Bibliography* of Karl Estreicher (Cracow, 1880 et seq.) is very important for the period from 1500 to 1800. In German: Lipnicki, *Geschichte der polnischen National-Litteratur* (Mainz, 1873), a short survey; Heinrich Nitschmann, *Geschichte der polnischen Litteratur* (2d ed., Leipzig, 1888); Alexander Brückner, *Geschichte der polnischen Literatur* (ib., 1901); id., in *Die osteuropäischen Literaturen* (Berlin, 1908). A good work in Russian is the second volume of Pypin and Spasovitch, *History of Slavic Literatures* (2d ed., St. Petersburg, 1879-80), which exists in a German translation by Pech, *Geschichte der slawischen Litteraturen* (Leipzig, 1880-84). Consult also G. M. C. Brandes, *Poland: A study of the Land, People, and Literature* (London, 1903).

POLITIAN, pò-lîsh't-an, or POLITIANUS, pò-lîsh't-ā'nūs. A celebrated Italian humanist. See POLIZIANO.

POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF. A learned society organized in Philadelphia, Dec. 14, 1889, and incorporated Feb. 14, 1891. Its membership has grown rapidly and in 1915 was more than 6300, distributed through the United States and more than 30 foreign countries. Its general advisory committee is composed of representatives of the faculties of the leading American and several foreign universities, the presidents and the secretary are connected with the University of Pennsylvania. Its object is the promoting of political and social science by publishing papers and reports and by the holding of scientific sessions. The annual meeting, consisting of six sessions, is held in Philadelphia in April. Its publication is the *Annals of the American Academy*, a bimonthly volume, each issue of which is devoted to a question of national or international importance along the lines of the political and social sciences. The first issue appeared in July, 1890, and in addition supplements have appeared containing translations of foreign works, and important monographs. There is a series of pamphlets also, containing the principal papers submitted to the Academy, of which more than 900 numbers have been issued.

POLITICAL ECONOMY. The term "economics," derived from the Greek words *oikos* (household) and *nomos* (law or regulation), was used by Xenophon, and, in the spurious treatise attributed to Aristotle, to signify the art of prudent and systematic household management, with particular reference to family income and expenditures and to the labor and satisfaction of the wants of the members of the household. Political economics, or political economy, as the words imply, originally signified the art of

directing the industry, the consumption, the incomes and expenditures of the state and its subjects with frugality and care, and in this sense was first used in the *Traité de l'économie politique*, published by Monchrétien de Vatteville in 1615. The use of the word in this significance soon became general. It was not until the nineteenth century that political economy came to be commonly conceived as a neutral science, divorced from the art of statesmanship. Economics then became the science of wealth, the study of those things that possess exchange value. This view became dominant about 1825, the abstract and theoretical treatment then in favor being divided into three or four topics: the production, consumption, and distribution of wealth (J. B. Say), or the production, distribution, and exchange of wealth (J. S. Mill), most subsequent writers including exchange and a minority following Mill in excluding consumption. Some writers (e.g., Senior, J. S. Mill) proposed to limit the term "political economy" to this comparatively narrow science of wealth; while others proposed to substitute for the term the titles *chrematistics* (Sismondi), *catalactics* (Whately), meaning the science of exchanges. A sharp reaction set in about 1850 against the attempt to increase the precision of the science by narrowing its scope. The Historical school (see below) maintained that the subject of the study was not wealth, but man's relation to wealth; that it was part of a general social science and could not profitably be divorced from ethics and politics. Economics, wrested from its old meaning of household management, is used or defended by Jevons, Marshall, Macleod, Ely, and other leading economists, but it is the brevity and not the clearness of the word that preserves it, since as now used it is affected with all the ambiguity of the longer title.

Content or Scope. The investigation of the social relations and activities connected with wealth may be divided into four stages. In the first stage we describe, classify, define, and enumerate economic phenomena. In the second we analyze and interpret these phenomena for the purpose of revealing cause and effect, of discovering uniformities and sequences or economic laws. In investigating economic uniformities we are virtually forced to certain conclusions about economic progress, and the theory of economic progress determines largely our interpretation of approximate aims and ideals; the determination of these ideals constitutes the third stage. In the fourth stage we discuss means to attain these aims and ideals. We may easily distinguish the stages in which one of these processes far outweighs in importance all the rest. Corresponding to the first stage we have economic history, economic methodology, and economic statistics; corresponding to the second stage is economic theory; to the third stage, the ethics of political economy; and to the fourth stage applied political economy, often but infelicitously called the art of political economy. It should be added that economic theory, also called economics, social economics, theory of political economy, etc., is usually subdivided further into the inductive theory and the deductive theory, and the latter is frequently called hypothetical, abstract, speculative, pure economics, or the pure theory. Briefly stated, the debate over the proper scope of political economy hinges about

the question whether the term "political economy" shall be applied to all or only to a part of these divisions. Some writers (e.g., H. von Scheel, Laveleye, and most German writers) would use the term "political economy" to cover all of them. The leading English economists of the present time would use the term so as to include all except ethics and applied political economy, while the fast-disappearing group of which Senior is the best example attempted to confine the science of political economy to abstract or hypothetical theory. For the purposes of the present discussion and following the usage of Adam Smith and the popular interpretation of the term, we may define political economy as the ordered knowledge of the social phenomena arising out of man's activity in the acquisition and use of wealth.

By wealth we mean goods and services possessing value. We mean useful things of a material nature and personal services that satisfy human wants, which exist in quantities below the amounts desired, so that each unit of them possesses distinct importance for us.

HISTORY OF ECONOMIC THOUGHT

Greece. Greek economic thought is characterized by an exaggerated confidence in the power of the state to mold human nature, control industry, and direct the growth of society. In political thought this resulted in a striking subordination of the individual to the state; in the study of society it led to the subordination of economics to politics and ethics. Slavery was generally indorsed; indeed it was probably regarded as indispensable by the majority. The Greek philosophers fully understood the advantages of the division of labor, and Aristotle entertained correct views upon money and advanced ideas concerning value. The Greek philosophers generally condemned interest taking and entertained the traditional prejudices against trade and commerce.

Rome. The Romans took their philosophy from the Greeks, and though they made important studies of particular economic problems, laborious studies have utterly failed to reveal the existence of anything approaching a dominant system of economic thought. Interest taking, avarice, and trade were generally condemned by the philosophers. Slavery was occasionally condemned—by Varro and Columella as an expensive and demoralizing industrial system, by Seneca on the general principles of the Stoic philosophy. In the Roman jurists we find evidence of systematic thought upon the nature of money, wealth, and capital, the encouragement of population, the regulation of private property and sumptuary control of various kinds, etc. But the general line of historical development is from Aristotle to the Christian Fathers and more particularly to the mediæval Canonists.

Christianity. The immediate effect of Christianity was to strengthen in general the prevalent Aristotelian system of economic philosophy, its condemnation of usury and the pursuit of wealth in trade, its assertion of the superiority of agriculture, and its support of the social system of status. Christianity thus strengthened the subjection of economics to ethics, but it weakened the subjection of economics to politics. Within the Church the equality of men before God was taught, also the essential dignity of

labor. The clergy were permitted to earn their own livelihood by manual labor, and the laity were exhorted to free their slaves as soon as they became Christians.

Middle Ages (400-1500 A.D.). Inasmuch as the teachings and doctrines of the early mediæval writers are well summed up in the *Corpus Juris Canonici* (see CANON LAW), it will be convenient to discuss them under the general heading of the canonists—the schoolmen and theologians who after the compilation of ecclesiastical laws by Gratian in the twelfth century analyzed and expounded, among other things, the relation to economic affairs of the Scriptures, the writings of the Christian Fathers, decisions of Church councils, and papal decrees. The doctrines of the canonists were derived largely from the scriptural injunctions against the excessive pursuit of wealth and the payment or acceptance of interest on loans. The early Fathers, in their condemnation of avarice and their exaltation of fraternal love, sometimes used expressions which taken by themselves imply an utter condemnation of private property and an advocacy of communism among the faithful, but this was only an ideal, and private property was early recognized as a necessity resulting from the fall of man. The effect of this ideal, however, appears in the accepted doctrine that the maintenance of the poor was not a matter of philanthropy, but an obligation. The scriptural attitude towards wealth led to an emphatic statement of the moral superiority of agriculture and handiwork over trade and commerce as a means of earning a livelihood; and the early writers seemed almost unanimous in the belief that what the seller made by trade the buyer necessarily lost. With the increasing temporal power of the Church and the great development of commerce which marked the eleventh century, came the necessity of harmonizing the doctrines of the Church with the obvious requirements of commerce, and many concessions were made by the later canonists. Thomas Aquinas (c.1226-74), the most authoritative of the later mediæval canonists, concedes that it is lawful to trade for a simple livelihood, or in order to supply a country with necessary articles which it does not produce within its own borders, or when the profits of the trade are devoted to some honorable purpose such as the assistance of the poor, but that, save in exceptional circumstances, a seller is bound to reveal a fault in an article, and that it is not permissible to sell an article for more than its worth. The fundamental axiom, in accordance with which all these conclusions are reached, is that every commodity has a fixed and objective value, which can be readily ascertained and which determines its just price. To ask more for an article than its just price was extortion, and to pay less was equally unjustifiable. The distinctively ethical point of view of the canonists is shown in the prohibition of usury (q.v.). This was based upon the scriptural injunctions against usury and upon the Aristotelian argument that, money being barren, it would be extortion to charge for its use. Another favorite argument was that interest was pay for time; but time is barren, and hence to demand interest was to demand something for nothing. It is needless to add that, as the growing commerce of the Middle Ages made the need of borrowing capital more and more imperative, the canonical theory was stretched so

as to accommodate many ingenious forms of contract for what was practically, though not nominally, usury. In the latter half of the fifteenth century the Franciscans themselves instituted the *monts-de-piété* (q.v.), or charitable banks for loaning money to the poor, and a small interest rate was imposed in order to defray the expenses of management. By the middle of the sixteenth century the Church had virtually abandoned its effort forcibly to suppress avarice and the pursuit of wealth.

Mercantilists (1500-1750). Mediæval economic theory had been dominated by ethical considerations; the economic thought of the early modern period was dominated by political necessities. Both the feudal system and the temporal power of the papacy had been undermined by the growth of the great modern monarchies. The problems and needs of the national states absorbed the best thought of the age. The most pressing problem of the new national governments was how to secure greater revenue. Philosophers and publicists, who would not have stooped to the elucidation of the laws of private wealth, bent their best energies to the solution of problems arising out of the establishment and maintenance of particular states. The problem of the economic thought of the period was, however, a larger one than the mere raising of the public revenue. It was requisite that this revenue should be secured in that form—ready money—which is most easily transformed into armies, navies, and the other material embodiments of national power; and the problem included, in addition, the necessity of finding or creating some more productive source of taxation than the backward agriculture of the period. With the problem of the mercantilists plainly before us it is easy to understand the characteristic features of the mercantile system which are described under that title. "Mercantilism," says Schmoller, "in its innermost kernel is nothing but state making—not state making in a narrow sense, but state making in the modern sense, which creates out of the political community an economic community." The restrictive regulations, discriminating laws, and state interference which Adam Smith and his immediate successors described as the essential features of mercantilism, we now know to have been in a sense incidental. State interference was distinctly a minor consideration—minor in the sense that it was not the problem at issue. Moreover, the mercantile system resulted, not in a loss, but in a net gain of industrial freedom. Contemporaneously with the imposition of those external restrictions that mark the mercantile economy went a rapid and extensive abolition of internal restrictions which had been far more numerous, brutal, and destructive than the new external regulations that succeeded them. The economic and political unit had merely increased its size. While mercantilism is the most important phenomenon of economic thought in the sixteenth and seventeenth centuries, it constituted only a part of a widespread and eager investigation of concrete economic facts. It was these studies that gave the political economy of Adam Smith its rich content of concrete phenomena. Money, banking, the rise of prices, population, poor relief, etc., were all extensively discussed in brochures and monographs. The maintenance of the poor was a continual subject of pamphlet and tract; and in the communistic *Utopia* of

Sir Thomas More we have striking evidence that the problem of poverty was occupying the attention of the best thinkers of the time. The study of statistics became widespread, and actuarial science and the investigation of social statistics were carried really to an advanced point. Neither is it correct to refer, as many have done, to the writers of this period as empiricists. Economic study had been divorced from ethics and theology, it is true, but at the hands of Bodin, Grotius, Pufendorf, Hobbes, and Locke economics was developed as an essential part of a general political philosophy. In the *De Jure Belli et Pacis* of Grotius (1625), particularly, the whole mercantile system is in reality brought to judgment before the greater doctrine of international equity, and we have a new application of the old doctrines of natural law and natural liberty, doctrines which were destined to play a greater rôle in modern economic science than the whole mercantile system.

Physiocrats. Mercantilism had been marked by a narrow favoritism of commerce and manufactures; a reaction in favor of agriculture was inevitable. The mercantilist doctrine had been characterized also by an enthusiastic, though not less narrow, nationalism; it was natural, then, that the reaction in favor of agriculture should ally itself with the broad principles of natural law and liberty expounded in the works of Grotius, Pufendorf, and Locke. This reaction in favor of agriculture and industrial liberty found expression in the doctrines of the so-called physiocrats (q.v.). The rise of the school may be dated from Quesnay's first economic monograph, which appeared in 1756. As is implied in their name, the fundamental doctrine of the physiocrats is the subjection of economic and political phenomena to natural law, which as interpreted by them gave rise to the familiar political doctrine of radical individualism and a certain materialistic conception of wealth which explains in a way all their peculiar economic theories. As Adam Smith noted, the physiocrats treated not only of political economy, "but of every other branch of the system of civil government," and their political and economic theories were indissolubly fused in their general doctrine of a beneficent natural law of industrial freedom, according to which the largest production and justest distribution of wealth would be best secured by permitting each individual to "pursue his own interest in his own way," so long as he did not infringe on the like liberty of others. This theory, perpetuated and popularized by Adam Smith, has exercised probably more influence upon subsequent thought than any other economic doctrine ever formulated.

While the physiocrats fully exposed the error of confusing wealth with the precious metals, they themselves fell into the error of confusing wealth with material objects. Identifying the production of wealth with the production of raw materials, they concluded that manufactures and commerce, which merely change the position or form of raw materials, are barren and unproductive, though useful and desirable when strictly subordinated to agriculture; that the value added to raw materials in the processes of trade and industry is equivalent merely to the cost or expenses of production, while agriculture yields a net surplus—*produit net*—over and above the expenses of production. To Quesnay, however, the large agricultural em-

ployer, not the agricultural laborer, was the real producer of wealth; and the physiocratic theory is especially strong and advanced in its analysis of capital. Agriculture being thus the sole ultimate source of national revenue, simplicity, economy, and justice demanded that the revenue of the state should be raised by a single direct tax—the *impôt unique*—levied upon rent. See SINGLE TAX.

Adam Smith, whose *Wealth of Nations* appeared in 1776, is easily the foremost figure in the history of economic thought. Next to his influence in hastening free trade and in popularizing and dignifying the systematic study of wealth, Smith's most important service, perhaps, was in divorcing political economy from ethics and in part from politics. This appears plainly from the outline of his lectures, which were divided into four parts: I. Natural Theology; II. Ethics, incorporated in his *Theory of Moral Sentiments*; III. Justice or Jurisprudence; IV. Political Economy. The attitude of Adam Smith in the *Wealth of Nations* is essentially this: assuming that the object of the study is to increase the national wealth as much as possible, this object will be most effectually secured by perfect industrial liberty. He left the prior question of the desire for wealth to the *Theory of Moral Sentiments*. On the other hand, he did not succeed so well in separating politics from economics. He could not get without the bounds of political philosophy, because his ultimate purpose was to prove the supreme efficacy of the doctrine of *laissez-faire*. Yet before he could lay down maxims for the increase of wealth it was necessary to inquire how wealth was actually produced and distributed, and in doing this disinterested work of science he ceases to be the advocate. It was this passionate analysis of production, value, and distribution which had the greatest effect upon the economists who followed him and which led to the attempt to formulate a nonpartisan science of political economy that should pass no ethical or political judgments. It must never be forgotten that Adam Smith was not wholly consistent in the development of his theories. At times he seems to hold that education should be left wholly to private initiative, but again he classes it among the necessary functions of government. In places he seems to hold a brief for "perfect industrial liberty," yet he does not hesitate to recommend the state regulation of banking, and his characterization of the Navigation Act as "perhaps the wisest of all the commercial regulations of England"—purely on political grounds—is famous. The most potent single quality of Smith's work was its so-called universalism. His work dealt with the wealth of nations, not with that of a particular nation or a particular epoch, and his confidence in the existence of a natural law of universal applicability left an indelible impression upon subsequent thinkers. Granted the existence of such a law, the conditions of time, place, race, and nationality must be matters of secondary importance. The superiority of the deductive method naturally follows.

Classical School. The economic thought of the early part of the nineteenth century was dominated by a group of writers including Bentham, Malthus, J. B. Say, Ricardo, McCulloch, James Mill, and others, who have been variously designated as the Classical, Orthodox, Ricardian, or English school. The leaders of this school

differed upon points of economic doctrine, but the general system of thought developed by them is strikingly harmonious—deductive in method, pessimistic in tone, utilitarian and materialistic in its assumptions, and cosmopolitan in the sense that its ultimate scientific ideal was the discovery of universal economic laws applicable to all nations at all times.

Jeremy Bentham (1748-1832) gave the classical economy its ethical framework through his formulation and tireless propagation of the utilitarian philosophy. Utilitarianism in its early form was largely an application to ethics of the individualistic doctrine of self-interest which Smith and the physiocrats had applied so skillfully in the field of political philosophy. "To obtain the greatest portion of happiness for himself is the object of every rational being," says Bentham. All that was materialistic, pessimistic, and mechanical in the classical system of political economy seems to have been magnified and intensified by the famous *Essay on the Principle of Population* by Malthus (q.v.), who in his fondness for the historical method of research was in marked contradistinction to the men about him. But his favorite method had little or no effect upon the classical political economy, while his famous doctrine that population tends to increase faster than food became the very backbone of the classical economy and modified almost every department of human thought. It may, indeed, be said that while Adam Smith investigated the causes of the wealth of nations, Malthus gave an exposition of the causes of poverty, and the contrast is not unfair. The one was essentially an optimist, the other, if not himself pessimistic, certainly gave a more pronounced impetus to pessimistic tendencies than any other economist in the history of the science. From the scientific standpoint the most important use made of the Malthusian proposition was in the Ricardian theory of distribution.

David Ricardo (1772-1823) held that as a country grew and population increased society would be forced to resort to poorer and poorer soils to obtain its supply of food, the law of diminishing returns would set in, and as the margin of cultivation was forced down an increasing share of the product of industry would go to the landlord in the shape of economic rent—the difference between the natural productivity of the better land and the worst land in cultivation. Excluding rent, the division of the remainder of the product between the laborer and the capitalist was determined by a corollary of the Malthusian principle—the "iron law of wages." In the long run, Ricardo held, wages would tend to equal the cost or price of the food, necessities, and conveniences required for the support of the laborer and his family in their accustomed style of living. Profits, naturally, consisted of the product minus rent and wages; they were "the leavings of wages." Ricardo's theory of progress, then, is clear. With the passage of time and the settlement of the country, rent would absorb a larger share of the produce, increasing both absolutely and relatively; wages would absorb a larger share, increasing relatively, but remaining constant in amount (with a tendency, however, to decrease as rents rose higher and higher); while profits would necessarily decrease both absolutely and relatively. This theory of distribution was developed as an integral part of his famous cost

of production theory of value, i.e., that commodities will tend to exchange in quantities proportional to their respective costs of production. In stating this theory Ricardo at times spoke as if all the expenses of production could be resolved into the toil and sacrifice of labor: commodities, he was fond of saying, tend to exchange for each other according to the respective amounts of labor embodied or realized in each. He thus supplied the Socialists with their celebrated labor theory of value, according to which labor is the sole cause of value and in consequence is entitled to the whole produce of industry. To a great extent Ricardo molded the economic thought of the day and has greatly influenced the later economists. The Socialists took from it, illogically perhaps, the iron law of wages and the labor theory of value. Henry George took from it, but logically in this case, the doctrine that progress itself means poverty so long as private property in land is permitted. Finally, Ricardo's theory shifted the centre of economic interest from the landowning classes to the capitalist class.

English Political Economy since Ricardo. The narrow scope, the deductive method, and the theoretical nature of the classical economy were all intensified and formally indorsed by N. W. Senior (1790-1864), the most influential English economist between Ricardo and the younger Mill. Within the limits of classical economics Senior did notable work: he cleared up many of the latent obscurities in the Ricardian theory of distribution, propounded the abstinence theory of interest, and formulated the famous doctrine of the wages fund (latent in the work of Smith, Ricardo, and others), that the average rate of wages is the quotient secured by dividing the number of workmen into the fund of capital set aside by the capitalists for the employment of labor. With the exception of the Malthusian principle, this doctrine probably contributed more than anything else to make political economy the "dismal science." Senior is remarkable also for his exposition of the extent to which the monopoly element enters into ordinary economic life. Under perfect competition, he declares, prices of commodities would accurately measure "the aggregate amount of the labor and abstinence necessary to continue their production." But he points out repeatedly that differential advantage of any kind in production gives rise to a monopolistic rent, which includes all income obtained without a proportionate sacrifice of labor or abstinence.

John Stuart Mill (1806-73) typifies the transition in England from the classical to the modern system of economic thought. He began his career as a Ricardian of the Ricardians, but in the later years of his life he came under the influence of Auguste Comte and the Socialistic thought of his time, and in 1848 his principal economic treatise appeared under the title *Principles of Political Economy, with Some of their Applications to Social Philosophy*—a queer compromise between the Ricardian economics, which he had learned in his youth, and the warm desire to find some means of improving the condition of the masses, which had come to him from the observations of his maturer years. The compromise was not fortunate from the standpoint of logic. Most economists since Mill, and Mill himself in his later years, recognized that the book was inconsistent; but it was superbly written, alive with the desire to improve the con-

dition of the masses, and it exercised an enormous influence upon the subsequent development of English economic thought. The modifications of the old doctrine which Mill introduced exercised probably a greater influence than the old theories which he incorporated in his *Principles*. He preserved the old doctrines of rent and profits and advocated *laissez-faire* as a general principle of political expediency, but made so many exceptions that at times they seem more important than the rule. Mill indorsed also the doctrine of the wage fund; but in his later years he abandoned his belief in this theory and advocated "views of the taxation and regulation of inheritance and bequest which would break down large fortunes and bring about a wider diffusion of property."

The development of English economic thought since 1850 has been profoundly affected by the reaction against the classical system described below, and only a few words can be devoted to the subject here. The logical successors of Ricardo and Senior were Cairnes, Bagehot, and Fawcett (to whom might be added Professor Marshall of Cambridge). It is impossible to characterize at length the work of these men, but all have been ardent defenders of the orthodox school, though they have recognized and ably expounded its limitations as a theoretical science. They stand as the modern defenders (Fawcett an extreme partisan) of the deductive type of economic theory. In Thorold Rogers, Cliffe Leslie, Arnold Toynbee, and Professors Ashley and Cunningham we have a group of historical economists who have made important contributions from the historical standpoint and have indorsed more or less completely the general views of the Historical school. (See below.) Jevons stands at the head of what might be called a psychological school of political economy, of whom perhaps the most distinguished living British exponents are Professor Edgeworth of Oxford and Professor Smart of Glasgow. Both Jevons and Edgeworth, however, have made important contributions in every branch of the science, particularly that of statistics; and the attempt to classify such men as Bagehot, Jevons, Marshall, Edgeworth, and Nicholson reminds us forcibly that the period of schools has fortunately passed. The representative English economists, like those of every other country, make the most of all schools and methods, deductive, historical, psychological, statistical, and mathematical.

Modern Reactions against the Classical System. Socialism. The earliest and most passionate protest against the classical economy came from the Socialists. (See SOCIALISM.) The antagonism between Socialism and the classical economy is fundamental and irreconcilable. The foundation of the latter was *laissez-faire*, and its theories were built around the system of private capitalistic enterprise; while Socialism is in essence a protest against *laissez-faire* and the private ownership of capital. The rise of modern Socialistic doctrine may conveniently be dated from William Godwin's *Inquiry Concerning Political Justice* (1793), although Godwin himself was inclined towards anarchism; but the chief bond uniting the early Socialists was their common hatred of the orthodox political economy. In recent times, largely under the influence of Karl Marx (q.v.), Socialism has acquired a positive theory which is adopted with substantial unanimity by the great mass of

people who may correctly be called Socialists. Logically enough this "scientific Socialism" has its roots in the Ricardian theory of value and distribution. Mutilating his theory of value and interpreting it ethically, they assert that, as labor is the sole cause of value, the laborer is entitled to the whole produce of industry. They accept a part of his gloomy law of wages, magnify the class antagonism inherent in his theory of distribution, and glory in the pessimism that unconsciously pervaded his analysis. On the basis of a broader historical survey than Ricardo permitted himself to make, they confidently assert that the régime of capitalism is but a temporary stage in industrial evolution and that it must inevitably give way to a régime of collective production. Marx's theory of value has met little but criticism from the economists, but his doctrine that the underlying causes of all social phenomena, such as religion, literature, and art, are economic in character—called by him the materialistic conception of history—has profoundly influenced the science, particularly in Germany.

Sociologists. To the sociologists may be ascribed the most fundamental and inclusive protest against the methods of the Classical school. The Ricardians aimed at an abstract science of rigid precision, universal in application, raised above the limitations of particular epochs and national boundaries. They were thus led to neglect history, custom, law, and ethics; they spoke as if the existing stage of economic development was permanent, and their method of treatment was predominantly deductive. The most effective protest against these exaggerations was made by the Historical school, which will be noted hereafter; but a more fundamental protest, and one prior in a point of time, was made by Auguste Comte (1798-1857), the father of modern sociology. He exercised great influence in shaping the methods of political economy and marking out its particular place among the social sciences. The influence of sociology upon modern economic thought will be discussed more fully in the article SOCIOLOGY.

Historical School. The most influential reaction against the classical economy was that inaugurated by what is known as the Historical school of Germany, and is usually dated from the work of Lorenz von Stein, *Der Sozialismus und Communismus des heutigen Frankreichs*, written in 1842, or, more correctly, from Wilhelm Roscher's *Grundriss zu Vorlesungen über die Staatswirtschaft nach geschichtlicher Methode*, published in 1843. Two contemporaries of Roscher, Bruno Hildebrand and Karl Knies, must be associated with Roscher and Stein in the introduction of this method, which has transformed economic science in Germany and profoundly affected it the world over. The positive doctrines of these writers, briefly summarized, maintain the propositions that economics is a social or political science which can be profitably pursued only in connection with the other sciences of social or political life, particularly administration, law, and history; and that not only are economic phenomena conditioned by general social and political institutions, but that these institutions are products of an ordered historical development, so that the economic science of any particular nation can be studied and formulated only in connection with the historical development of that nation. Thus, instead of a universal political economy we

have a historical national economy. From the standpoint of method the work of the Historical school was simply an application to economic investigation of a method that had been developed and popularized by Grimm, Savigny, Eichhorn, and other German investigators in philology, history, and jurisprudence a generation before the rise of the Historical school of political economy. What may be called the nationalistic spirit of the school was the result of irresistible political forces of the day, first expressed in the economic publications of Friedrich List (1789-1846). Germany was in the process of developing into a great empire, and, as has been pointed out in connection with the mercantile system, such a period in the life of a nation is almost invariably attended with protective legislation designed to make the new state industrially as well as politically independent and homogeneous. The new German economics simply expressed these economic and political tendencies, to which attention had been called by List. The work of the German economists who succeeded Roscher, Knies, and Hildebrand has been marked by a predominant use of the inductive method and a close adherence to actual economic phenomena; by special study of the effect of legal institutions, custom, law, and ethics upon economic phenomena; by an intermediate attitude between extreme protectionism and extreme free-trade views; and by a discriminating sympathy with the claims of Socialism. Quite generally they look to the state rather than to individual initiative to solve the problem of poverty, and they have thus become known as *Kathedersocialisten* (Socialists of the professorial chair), or State Socialists, as contrasted with the Social Democrats, whose radical programme they refuse to indorse.

The American reaction precedes in point of time the National Oekonomie of Germany, and, like the latter, had its source in the political problems attendant upon the rise of a new state. The first systematic protest came from an early group of publicists, among whom may be mentioned Alexander Hamilton, Daniel Raymond, Matthew Carey, Hezekiah Niles, and Friedrich List. Daniel Raymond is the author of the first treatise on political economy in which a distinctively American system was advanced. His first work, *Thoughts on Political Economy*, appeared in 1820, and undoubtedly attracted a good deal of attention in certain circles. The fundamental idea of Raymond's system is his conception of wealth. Wealth, he held, is not an aggregation of exchange values, such as Adam Smith had conceived it, but the capacity or opportunity to acquire the necessities and conveniences of life by labor. The English political economy, he held, was a study of exchange values, of private economy as opposed to national economy, and the laws of wealth laid down by Adam Smith were untrue of a nation conceived as a unity. Extending his doctrine of wealth, he maintained that the interests of one class do not always coincide with the interests of the nation as a whole, and that national wealth in its true sense will be most rapidly increased by developing all the national powers to their widest possible extent. He is, thus, a warm advocate of protection as opposed to the doctrine of *laissez-faire*.

We come to a second period of development in American economic thought with Henry C. Carey (1793-1879), by far the most influential

of the earlier American economists. Carey's work is especially noteworthy, not only for his earnest defense of protection, but also for his economic optimism and his continued attacks upon the Ricardian school. Drawing his lessons from American experience, he flatly denied the Malthusian principle and the law of diminishing returns. Carey's position upon these points was undoubtedly well taken for the America of his time, and although it is questionable whether he was justified in defending the exact converse of these propositions, he did unquestionably show that the fundamental premises of the classical economy were not universally applicable. Carey defended a broad social conception of wealth similar to that held by Raymond, defining it as the measure of power which man has acquired over nature, while "the value of an object expresses the resistance of nature which labor has to overcome to produce the object." Carey thus was led to propose the theory that the value of an object depends rather upon the cost of reproduction than upon the cost of production. Perhaps the central doctrine of his system is that of association. The increase of wealth, the increasing mastery of man over nature, the development of a nation's powers, Carey held to be dependent upon the increasing association resulting from a compact population following diversified pursuits with a close interrelationship between agriculture and manufactures. It was this optimistic belief in the possibilities of increased association that led him to advocate protection and to survey an increasing population with the greatest complacency. Since Carey's time other American economists, like Henry George and Francis A. Walker, have exerted a world-wide influence upon economic thought. The younger generation of American economists have been largely trained in the German universities, and have in the main accepted the positive doctrines of the German Historical school. Without depreciating the work of the great English economists, it may be said that American investigation is marked by the attempt to test and supplement deductive reasoning by an appeal to statistics, law, and history.

Austrian School. This represents a reaction within the limits of the classical economy itself. The name, "Austrian school," is used simply because the marginal utility theory of value, which constitutes the essence of this reaction, has been most thoroughly developed and most widely applied by a group of Austrian economists, including Professors Menger, Wieser, Sax, and Boehm von Bawerk, though the theory itself was propounded almost simultaneously in 1871 by Professor Jevons in England and Menger in Austria, and is now used by a large majority of economists everywhere. The adherents of this school held, in brief, that the utility (i.e., power of satisfying want) possessed by a commodity decreases per unit as the amount consumed increases, and that value itself is dependent upon the utility of the last or marginal increment of the commodity supplied for consumption. It cannot be doubted that they have transformed economic theory; the old unit of real value—the pain and sacrifice of labor—has given way to a unit of utility; and the cost-of-production theory of exchange has been replaced by a wider conception, which holds that value determines the expenses of production rather than that the expenses of production determine value; that

capital receives its value from the finished product, and not vice versa; etc. The whole tendency of this theory (see *VALUE*) has been to shift the centre of gravity in economics from the capitalist to the consumer and to block the movement to confine political economy to a study of exchange value. It has undoubtedly clarified our general conceptions of wealth and exchange much in the same way that the theory of evolution has clarified our general conception of progress.

SCOPE AND METHOD

Relation of Political Economy to Sociology. The most inclusive and fundamental question of scope is the relation of political economy to the general science of human association. Two extreme views of this relation have been maintained: (1) that because of the intimate and inseparable connection between all forms of social activity, the study of economic phenomena cannot be divorced from the general study of sociology (e.g., Comte, H. von Scheel, Ingram); (2) that political economy is an absolutely independent science, dealing with the phenomena of wealth alone (e.g., Senior, Mill, Cairnes). At present there is a strong consensus of opinion that both these views are ill advised. While it is now admitted with virtual unanimity that political economy is a social science, the bewildering complexity of social phenomena, together with the slow progress of sociology conceived as the general science of human association, has deeply strengthened the conviction, borne out in other departments of scientific investigation, that specialization and the isolation of phenomena are indispensable.

Relation of Political Economy to Ethics, Law, and Politics. In discussing this question attention may be confined largely to the relationship between ethics and political economy, since the decisive arguments apply to all three relationships. Substantial unanimity exists upon the following points. (a) that ethics and economics are, for purposes of investigation at least, two distinct sciences; their fields are not coextensive; (b) in applied political economy we must take account of ethical requirements; no economist would maintain that in actual life men are "freed from the ordinary obligations of justice and humanity"; (c) in so far as ethical forces affect economic activity, economic science must take account of these forces. The point at issue is the question whether the scientist, as scientist, is permitted or compelled to set up ideals and pass ethical judgments. The following reasons may be given for the conclusion that it is virtually impossible for the scientist to abstain from passing ethical judgments: In the first place, every rational adult understands and accepts certain axiomatic ethical canons which in their practical application are universally accepted (e.g., that the satisfaction of hunger is a good thing). In the investigation of actual economic phenomena, such as the housing and food of the laboring classes, conditions are continually met with that violate these ethical canons. It would be the sheerest pedantry under these conditions to refrain from passing ethical judgments. Secondly, an essential part of economic science is that subdivision which treats of economic progress. In economic life what ought to be done is intimately dependent upon what can be done; in other words, the law of economic growth is a powerful, if not

the most powerful, factor in determining economic aims and ideals. If the fully equipped economist is forced to study economic growth and to explain economic movements and tendencies, it follows that he is forced to express opinions upon approximate economic ideals, and, having furnished the decisive arguments for ethical judgments, he must either apply his results or have some less well-qualified person apply them for him. Additional reasons appear when we examine such subjects as taxation or those public prices which the law declares must be just and reasonable. In the consideration of railroad rates, e.g., the economist is not only compelled to pass judgment upon what is just and reasonable, but he discovers upon investigation that economic considerations supply the most important factors in determining this judgment. There is, then, a broad zone of territory between ethics and economics which the moralist has not worked—and which for the science of ethics is probably unimportant—but which the economist must clear up before he can go on with his work. The assertion that the science of political economy may and should refrain from passing ethical judgments rests upon two misapprehensions: (1) the failure to grasp the fact that society is like an organism in that it is subject to a law of ordered change, which to a certain extent is under the control of the organism itself; (2) an illogical conclusion from the recognized truth that certain subdivisions of economic investigation (e.g., fixation of prices in wholesale markets) may be exploited quite thoroughly without determining economic ideals and without introducing ethical considerations. From this it is logical to conclude that certain minor subdivisions of political economy may be investigated "without passing ethical judgments," but illogical to conclude that the whole science may be so investigated and formulated. The foregoing conclusions are strengthened when we consider the relation of economics to law or politics. In describing the progress of the past or the conditions of the present we are forced to pass judgment upon the economic success or failure of many laws and policies (e.g., tariff laws) which are still in force or under active consideration and which will be indorsed or repudiated solely or largely upon economic grounds. Because of this fact the economist cannot refrain from passing judgment upon laws and political policies. Nor without being ridiculous can he refrain on occasion from laying down precepts. Gresham's law, e.g., is at once a law and a precept when a proposition is under consideration to maintain two kinds of money of differing degrees of value in circulation, side by side. In conclusion it may be said that, while political economy does not undertake the complete study of law, ethics, politics, etc., it must consider systematically the parts of those sciences that materially affect economic phenomena. It is neither possible nor desirable that the line of demarcation should be rigidly drawn, particularly in the applied science or art of political economy, which may be defined as the application of economic laws to the solution of those practical problems in which economic considerations are of predominant importance.

Relation to Other Sciences. Political economy is probably more dependent upon history than upon any other science, and indeed an extreme wing of the Historical school, of which Schmoller is the most prominent example, holds

that until a larger store of historical results is accumulated it is of little use to attempt broad theoretical generalizations, thus confining economics for the present to the philosophy of economic history. This position seems untenable because of the evident logical deficiencies of the historical method when used alone and because new problems are continually arising upon which history throws little light. (See *Deductive Method*, below.) While the great majority of economists refuse to admit that political economy is merely history, the importance and necessity of economic history are now universally conceded. Dr. Keynes classifies the functions of economic history in connection with economic theory as follows: "First, to illustrate and test conclusions not themselves resting on historical evidence; secondly, to teach the limits of the actual applicability of economic doctrines; thirdly, to afford a basis for the direct attainment of economic truths of a theoretical nature."

The connection with psychology is particularly intimate. As a study beginning with human effort and ending with the satisfaction of human wants, economics really has its beginning and its end in psychology. The theory of value, particularly, takes its fundamental axioms from psychology (e.g., that the satisfaction afforded by commodities decreases per unit as the amount consumed increases).

Deductive Method. What is known in economics as the deductive method consists usually of three stages, the first and last of which are inductive. In the preliminary stage, either from common observation or more complex induction, the postulates of the deductive science are secured. In the English economic theory prevalent from Ricardo to Cairnes these postulates were excessively simplified. Ricardo, like Adam Smith, was fond of drawing his premises from an imaginary state of primitive industry. Senior reduced the postulates of political economy to four general propositions: "(1) That every man desires to obtain additional wealth with as little sacrifice as possible. (2) That the population of the world is limited only by moral or physical evil, or by fear of a deficiency of those articles of wealth which the habits of the individuals of each class of its inhabitants lead them to require. (3) That the powers of labor, and of the other instruments which produce wealth, may be indefinitely increased by using their products as a means of future production. (4) That, agricultural skill remaining the same, additional labor employed on the land within a given district produces in general a less proportionate return." It is impossible to give a list of the postulates which have been assumed by different writers, but it is evident that they must vary widely in different branches of the science and that almost every deductive writer has unconsciously assumed many postulates not specifically stated. In the ordinary deductive treatment of value and distribution the following propositions are usually postulated: that men not only desire but know how in general to obtain the maximum satisfaction with the minimum effort; that certain industries are subject to the law of increasing rather than diminishing returns; that the satisfaction afforded by a commodity decreases (per unit) as the amount consumed increases; that existing law, public opinion, and ethical standards in general remain constant. It is the inter-

mediate stage that is most appropriately called deductive. Here the familiar processes of the deductive logic are employed. It is evident, however, that the results obtained from the artificially simplified premises of ordinary deductive theory are of doubtful value. If the postulates be absolutely true and the deduction faultless, the conclusions express abstract tendencies which will be modified in real life by the action of secondary forces not taken into account in the premises. This, however, is the character of the pure theory of all sciences. If, on the other hand, the premises practically cover the predominant forces in any domain of economics, they may yield results capable of explaining actual economic conditions and capable of affording the basis of prevision. In actual usage, however, these postulates have been sometimes untrue, often ambiguous, and always more numerous than was explicitly stated; so that Cliffe Leslie and other writers of the Historical school have characterized the conclusions of English theory as utterly inapplicable in any sense either to the explanation of existing conditions or to the solution of practical problems. This extreme antipathy to deductive theory is, however, plainly illogical. Whatever the necessity of studying the past, no one denies that the present and the future furnish the ultimate and principal problems of the science. And many of these problems are new; to solve them we must isolate the factors at work, calculate separately their effects, and try to estimate the net results. This process must be largely deductive, and it is strange that those who insist most strenuously that the science is purely practical should attack a method necessary in the solution of practical problems. The historical method alone is helpless in the face of such a problem as the proposition to introduce compulsory arbitration.

Of the third stage in the deductive process, that of verification by observation, little need be said. In practice it is exceedingly difficult, as was shown when Mill attempted to apply the Ricardian theories, but it is essentially a species of induction subject to all the limitations of the inductive method in general.

Inductive Method. The ultimate aim of the inductive method is by systematic analysis and comparison of concrete economic phenomena "to observe the effects of a cause coming singly into action while all other forces remain unaltered." The attempt to do this gives rise to two inductive processes—the method of difference and the method of agreement. In the method of difference we compare circumstances exactly similar with the exception of one factor in order to discover the effect of that factor. The chief instrument of the method of difference is thus the experiment, to which may be added in economics the observation of extraordinary instances in which the conditions of an experiment are closely approximated by some fortuitous or extraordinary event. Thus, the Black Death in England furnishes a striking exemplification of the effect upon wages of a sudden diminution in the supply of labor. In theory the method of difference requires that the collateral or surrounding circumstances shall be absolutely alike. This condition is seldom fulfilled even approximately, and hundreds of instances might be cited in which the method has been abused. Finally, it is to be noted that the method of difference, while entirely satisfactory where the conditions are perfect, is always nar-

row and restricted. It shows with certainty that a given cause in a certain set of circumstances can produce a certain result, but tells us nothing of what will happen in another set of circumstances.

To generalize, to establish uniformities, use is made of the method of agreement. Here we compare circumstances wholly different, with the exception of two phenomena between which we expect to establish a causal connection. The casual connection is indicated by the repeated conjunction of the two phenomena. If we examine the movement of exports and the movement of the marriage rate, and find that a rise in the exports per capita is always accompanied by a rise in the marriage rate, we are safe in accepting this connection as an economic uniformity or law, provided that we have examined a very large number of instances in which the collateral circumstances have been infinitely diverse and varied. Theoretically this method requires that we should exhaust every possible combination of circumstances before concluding that a rise in the exports per capita will always cause an increase in the number of marriages.

With respect to the general utility of the inductive method, it is plain that, though little can be done without it, it seldom, if ever, suffices to convince. Take the case of the exports and the marriage rates cited above. Hundreds of instances might be adduced from English statistics in which a rise in the per capita exports has been followed by a rise in the marriage rate. Yet no one believes that a mere increase in exports would cause an increase of marriages. Both are evidently the results of a single cause—active business, etc. Brisk trade, high wages, steady employment, etc., stimulate marriage and show themselves usually in an increased volume of exports, yet if commercial prosperity at any time increased without stimulating exports, we have every reason to believe that the marriage rate would rise irrespective of exports. And in less developed countries, where trade and commerce are relatively unimportant, no connection is observed between exports and marriage. The great difficulty of induction in economics is owing to the complexity of economic phenomena: we are seldom able either to bring about a satisfactory experiment or to secure a sufficiently diverse number of instances of agreement. Current literature is full of sweeping generalizations based upon far less agreement than that observed between marriages and exports. The 25 years preceding the repeal of the Corn Laws in England were, on the whole, far less prosperous than the 25 years that succeeded the repeal; *ergo*, concluded many writers, free trade would be advantageous to every country of the world. On the other hand, the method of agreement has been equally abused. Because the creation of the great modern European monarchies was in most instances accompanied by protective tariffs, colonization schemes, and a certain harshness and brutality towards strangers, therefore, concluded the extremists of the German Historical school, it is not only expedient, but ethically right, that the German Empire in the last half of the nineteenth century should begin with protective tariffs, colonization schemes, and the policy of the mailed fist. To-day it is universally conceded that both methods must and should be used wherever possible.

Other Methods. In actual practice a large

number of complicated combinations of the deductive and inductive methods are used in economics. Induction in its quantitative aspect gives rise to the statistical method. No school of political economy has ever disputed the importance and value of statistics, and in the last few years it has made more rapid progress, perhaps, than any other branch of the science. This is due to the increased public expenditures in statistical investigations and the impetus given to the improvement of the study by such associations as the International Statistical Institute, the Royal Statistical Society, and the American Statistical Association. So great has been the development of statistical technique at the hands of such men as Quetelet, Bertillon, Engels, Von Mayr, Edgeworth (to whom should be added from other sciences Galton, Venn, Karl Pearson, etc.), that the technique of quantitative induction constitutes in reality a new branch of science. (See STATISTICS.) Deduction in its quantitative aspect gives rise to the mathematical method of political economy, which at present is employed to a greater or less extent in all branches of economic theory, particularly in the investigation of prices, incidence of taxation, etc.

POLITICAL OFFENSES. Acts that are considered injurious to the safety of the state in its political capacity or that involve a violation of the allegiance due from a subject or a citizen to the supreme authority of a nation. Such offenses are distinguished from ordinary crimes which disturb the public peace (as murder, theft, arson) but are not directed against the government. On the assumption that persons arriving from foreign countries after the commission of a political offense have been actuated by motives of patriotism, they are now received as refugees and protected in the more progressive countries, especially in England and the United States. For protection in legations, see *ASYLUM*, *RIGHT OF*. Offenses of a political nature are almost always excluded by the terms of extradition treaties. The tendency in modern times is to deal leniently with political offenders. Although treason is nominally punishable with death in most countries, the sentence is now usually commuted to life imprisonment. See *CITIZEN*; *EXTRADITION*; *GOVERNMENT*; *TREASON*.

POLITICAL PARTIES. Voluntary associations or organizations of citizens for the attainment of desired ends or policies through united political action. They are found in all democratic states and all countries governed upon a constitutional basis, and are a necessary accompaniment of popular government, although in recent years direct political action through the medium of the initiative, referendum, and recall, and the growing influence of the independent vote, have in a measure weakened the control of parties. English-speaking nations have shown the greatest aptitude for party organization, and generally the two-party system has obtained. The theory and general practice of parties among the Latin and other peoples that have followed the English race in the adoption of representative government are the same, although race characteristics and lack of training for self-governing institutions have modified the party system in actual practice among these peoples. In these countries there is a tendency of parties to split up into factions or groups, advocating more or less separate and distinct ideas. The political groups in France and Spain illustrate this tendency. Governments are supported by combinations of groups or *blocs*—a word first used by M. Clemenceau—and their

alignment is changeable. Each of the great parties in the United States and in Great Britain stands for a number of principles, to all of which its members may not agree, whereas under the plural party system this anomalous loyalty is not required nor does it exist.

Aside from local and temporary issues, there are certain natural lines of cleavage in political society which have an influence in the composition of parties. The division between conservative and radical, with all the intermediate gradations of belief, is as old as society and underlies nearly all parties that are not mere personal factions. In the political philosophy of the world the nice balance between the conservative spirit that clings to that which is sanctioned by established usage and the radical, progressive, or liberal spirit, which seeks modification of the old in the interest of progress, is most desirable. This end is somewhat imperfectly attained by the opposition of parties representing in some form the two ideals. This is the broadest and most universal idea that divides parties. In England, where the highly developed parliamentary government makes for strong party organizations, they form almost a part of the government machinery itself, and have their chosen and officially recognized leaders by whom the party policy is voiced and directed. In other countries, although their influence upon the government is as important, their connection with it has less of an official character. Below is given a summarized account of party relations in the various European countries, Canada, China, and Japan. Political parties in the United States are described under their historical names, as *DEMOCRATIC PARTY*; *PROGRESSIVE PARTY*; *REPUBLICAN PARTY*; *WHIG PARTY*; *ETC.*

Austria-Hungary. The strong national feeling on the part of different peoples embraced in the Dual Monarchy and the peculiar constitution of the Empire have aligned parties during the nineteenth century chiefly upon race lines. In the Empire there are 10 great nationalities, with subdivisions amounting to 26. These are mutually jealous and antagonistic, and this fact determines the policy of the Imperial ministry, which is, in general, to create its own party support by combining different race groups against the others. These alignments are by no means permanent or stable. After the revolutionary movement of 1848 a period of absolutist reaction set in, which suppressed all political life for 10 years. In 1861, after the failure of an attempt to reorganize the Empire on a federalistic basis, the government proceeded to establish a constitutional system upon a basis of consolidation. In this reconstruction the aspirations of the Magyars were all but completely ignored. During the period between 1860 and 1867 the so-called Federalist party stood for conservatism in its strictest sense, and party government as distinguished from the Imperial policy can hardly be spoken of. After a suspension of the constitution the Compromise of 1867 (see *AUSGLEICH*; *AUSTRIA-HUNGARY*) was arranged, establishing the present dual system. Under it party contests in Cisleithania became more pronounced. The Germans divided into several groups, such as German Nationalists, Clericals, Progressives, Radicals, Agrarians, Social Democrats, and Christian Socialists. The Socialists (83 in 1911) represent, as in Germany, in great measure the aspirations of the

liberal elements, and the spread of their political faith has encouraged a tendency to disregard racial and provincial lines. This tendency, however, has not been successful; for in 1911, in the Reichsrat, there were only 23 Independents out of 446 not identified with some race. Christian Socialism (73 in 1911) has become but another name for the rampant party of anti-Semitism. Of late the anti-German attitude of the Roman Catholic clergy has given impetus to the so-called *Los-von-Rom* movement, which has driven thousands of liberal Germans in Lower Austria, Bohemia, Moravia, Silesia, and Styria into the fold of Protestantism and Old Catholicism. The nationalist groups or parties are the Czechs, Poles, Ruthenians, Slovenes, Italians, Croats, and Rumanians. Of these the most important are the Czechs. This group has its aristocratic and democratic wings, the Old and the Young Czechs, who have united in recent years in a demand for the recognition of the Czech nationality through a union of Bohemia, Moravia, and Silesia as a kingdom, united with Austria only by treaty, as Hungary is, and not organically. The Austrian Slavs, with the exception of the Poles, are very friendly to Russia, while the liberal Germans naturally lean towards Germany. These are united with the Magyars of Hungary in common fear of Slavic domination. A reform bill passed in 1907, by Baron Beck, provided for universal manhood suffrage to those over 24 years of age, and the immediate result was to give the Slavs a majority of the seats in the Reichsrat, and to show that, apart from nationalities, the Social Democrats and Christian Socialists were the strongest single parties. For Hungary (Transleithania), see *Hungary* below. While Austrian party history has been concerned chiefly with conflicts or race, those races have severally disintegrated into cliques. In the elections of 1911 there were 51 parties in the field, each having a separate organization. Between 1897 and 1907 there were periods of prolonged deadlocks in the Reichsrat over the language question, each race contending that its language should be utilized at public functions and by the army recruited from its citizens.

Balkan States. In the Balkan states—Bulgaria, Rumania, and Servia—pro-Russian and anti-Russian sentiment formerly had a principal share in the alignment of parties, especially in Bulgaria. In Bulgaria, before the union with Eastern Rumelia (1885), there were Radicals, who demanded union, and Conservatives, who were satisfied with the existing condition. After the union, in the face of Russia's bitter opposition thereto, the Radicals became anti-Russian. The Bulgarian Nationalists sought to unite all Macedonia under Bulgaria, and therein Bulgaria's interests clashed with those of Greece and of Servia. The Nationalists supported the Balkan War of 1912-13 (q.v.) and inspired the intervention of Bulgaria in the Great War in 1915; their only serious opponents were a small but growing group of Social Democrats. Rumania, of all this group of states, is the most settled in its political life. The major parties are Conservatives and Liberals, the government is of the parliamentary form, and these two parties have alternated in the ministry; in late years Rumanian politics have been complicated by the appearance of two new groups—the Agrarians, an offshoot of the Conservatives, and the Socialists, a radical element of the

Liberals. In Servia the parties are Liberals, who are pro-Russian; Radicals, also pro-Russian; and Progressists, whose former tendency to lean to the side of Austria in political matters has been supplanted since 1908 by a strictly nationalist tendency combined with many projects of social reform. For actual political conditions in the Balkan states, see *BULGARIA*; *MONTENEGRO*; *RUMANIA*; *SERVIA*.

Belgium. The chief parties are three—Clericals or Catholics, Liberals or anti-Catholics, and Socialists—and there is in addition the group of Christian Democrats. Until 1847 there was a struggle against the crown to establish party government through a responsible ministry. Since that year the ministry has been taken from the majority in the Chamber of Deputies. The parties have alternated in control, but since 1884 the Catholics have held the government and have gathered to themselves the conservative elements of society repelled by the growing political importance of the Socialists. In 1893 an active agitation resulted in the adoption of universal suffrage, combined with plural voting by those who had certain property and educational qualifications. Since that time the Liberal party has acted in close coöperation with the Socialists. The elections of 1902 gave the Clericals a majority of 24 in the Crown Chamber. This majority was gradually reduced at subsequent elections until in 1910 it was only 6. But when, in 1912, the Liberals and Socialists went before the country with a programme to abolish both state support to denominational schools and plural voting, the Catholic majority in the Chamber was increased to 18; and the attempt in 1913 to force the adoption of the same measures by a general strike of all manual laborers was likewise unsuccessful. In 1914, when Belgian territory was largely occupied by German forces, the seat of government was moved to Havre, France, where the political life of the nation was resumed.

Canada. Political parties were first effectively organized after the War of 1812. Aroused by the political monopoly and social arrogance of a group of Tory officials and families known as the Family Compact, opposition in Upper Canada took the shape of a Reform or Liberal party which demanded responsible government. Its leaders were William Lyon Mackenzie, Robert Baldwin, John Rolph, and Marshal Spring Bidwell (q.v.). The Liberals of Lower Canada, led by Papineau, also began to contend for increased popular rights. Rebellions in 1837-38 gained a partial victory for reform in both provinces, and this was followed by the mission to Canada of Lord Durham, on whose famous report was based the Act of Union (1841). The struggle for responsible government was renewed in the Province of Canada created by the Act of 1841. Also new dangers appeared in the racial and religious solidarity of the French Catholics of Lower Canada, who feared that the demand for representation by population made by the British in the sister province was intended to prejudice French influence in the Legislative Assembly. About 1849 new party alignments were evident. Moderate English-speaking Liberals, led by Baldwin and later known as Baldwin Reformers, drew away from the more advanced section of the party and were largely absorbed by the Liberal-Conservative (commonly called Conservative) party, organized by Sir John A. Macdonald to supersede reaction-

ary Toryism. The advanced English-speaking Liberals were organized as the Clear Grit party, with a radical reform programme resembling Chartism (q.v.). Among its leaders were Peter Perry, John Rolph, and, later, Malcolm Cameron (qq.v.). In Lower Canada arose the Parti Rouge, or the Rouges, with principles similar in some respects to those of the Clear Grits, but even more radical in others, including the repeal of the Act of Union and the advocacy of a republic. Papineau was its leader, and among his associates were A. A. Dorion and Luther H. Holton (qq.v.). Neither the Clear Grits nor the Rouges gained a permanent place, both being gradually displaced and dissolved by political deadlock of the two provinces and by the necessities of the movement for Confederation which resulted in 1867 in the formation of the Dominion of Canada. This compelled another readjustment of parties. George Brown, who was hostile to the Clear Grits, had already brought back the rank and file of the Liberals under one banner, and the Rouges had moderated their programme. But Confederation, which marked off specified provincial rights from the residuum of unspecified federal or national rights, likewise compelled a dual system of parties, federal and provincial, the old names of Liberal and Conservative being retained. Variations thereof by parties organized for special or temporary issues are referred to in the article on PARTY NAMES.

After 1873, in Dominion politics, the Liberal and Conservative parties practically held the field, the former leaning to free trade, though restricted in practice to a moderate revenue tariff in 1873-78, the latter establishing a protective policy in 1879. As regards federal and provincial rights neither party could be said to be wholly aligned on either side, though the Conservatives emphasized federalism and the Liberals in notable instances sustained provincial rights. During the Laurier régime of 1896-1911 the protective policy was not seriously disturbed. In 1911 the Conservatives regained power by their opposition to the Taft-Fielding reciprocity agreement, although at various times they had themselves favored reciprocity with the United States. Thus under the guise of traditional forms the two parties were largely opportunist. See CANADA, *History*; also histories of the various provinces.

China. Political parties in the modern sense can scarcely be said to have developed in China, despite the formation of the republic. For the parties existent before 1912, see CHINA. In republican China there were at first two main party divisions with many subdivisions. The Conservatives and moderate Republicans, together with many Imperialists, were led by Yuan Shi-k'ai. The Radicals, or Kuo Ming Tang, an outgrowth of the old Tung Meng Hui and Young China parties, were led by Sun Yat-sen, Li Yuan-hung, Chen Chi-mei, and Huang Hsing, and demanded a liberal constitution, reform, and Western culture and science. Somewhat similar to this division was that between the Pekingese party of the North and the Cantonese party of the South. The revolution of 1911-12 resulted in the overthrow of the Empire and the partial victory of Kuo Ming Tang, but the Constitutional Assembly was dissolved by Yuan Shi-k'ai before the Radicals could carry their programme. A powerful reaction of sentiment occurred in the country, the President

practically dissolved Parliament, the leaders of Sun Yat-sen's party fled from China, and the Conservatives were left in control. In 1915 the Council of State voted to return to monarchy. The throne was offered to Yuan Shi-k'ai (q.v.), who accepted it. Consult *China Year-Book*.

Denmark. Parties in Denmark took on a new formation after the cession of Schleswig-Holstein and Lauenburg in 1864. Under the constitution of 1866 the Diet was composed of two chambers—the Folkething, the popular representative branch, and the Landsting, consisting of 12 members appointed by the King and 44 elected by voters possessing incomes of 2000 crowns. The Liberal-Nationalist party, which had opposed the cession of the duchies, became a conservative landholding and official class party, controlling the Landsting, while the masses, represented in the Folkething, stood in opposition. Their representatives, the various radical groups, drew together as the United Left, but composed chiefly of the Moderate Left and the Democratic Left. An endless dispute after 1872 arose over the budget between the Houses, the Democratic Left, controlling the Folkething, refusing to admit the veto of the Landsting. Despite this opposition the Conservatives under Jacob Estrup held office from 1875 to 1894. He employed the Bismarck expedient of appropriating funds by royal ordinance. The cabinets were of a conservative character and in hostile relations with the Folkething until 1901, when a Liberal ministry was organized by Deuntzer. He resigned in 1905, but the Liberal policy was continued until 1909, when the influence of the Radicals and Socialists increased. There ensued a period of ministerial instability. In 1913, however, Premier Zahle formed a strong cabinet from the Left.

France. The French Revolution, by the impulse that it gave to the growth of democracy, introduced political parties in continental Europe (See FEUILLANTS; GIRONDISTS; JACOBINS.) With the Restoration there appeared the two monarchist parties—the Constitutional Monarchists and the Ultra Royalists. (See CHAMBRE INTROUVABLE.) There were also the Doctrinaires, Republicans, and Bonapartists. With the accession of the house of Orléans in the person of Louis Philippe, French parties underwent a readjustment. The existing monarchy was opposed by Legitimists, who sought the return of the elder Bourbon line; Bonapartists, who would have restored the Napoleonic régime; and Republicans. The Orleanist monarchy was overthrown, by the Republicans and Socialists (see FEBRUARY REVOLUTION), but the Bonapartists became dominant after the coup d'état of Dec. 2, 1851. (See NAPOLEON III.) From 1852 to 1860 the Emperor exercised almost autocratic power, and politics were dormant so far as popular parties and parliamentary life were concerned. Later he lost the support of the Catholic clergy by his Italian policy, and was compelled to turn more to the Liberals. He thus reopened the active political life of France. Republicans, Orleanists, and Legitimists at once formed an Opposition. Parliamentary action was renewed. A Liberal Imperialist party supported the Emperor, but opposed his ministers. Upon this party Napoleon depended to maintain the Empire against the Royalist and Republican coalition in 1869-70. The French defeat in 1870-71 (see FRANCO-

GERMAN WAR) overthrew the Empire and presented the Republicans their opportunity. When the Third Republic rose upon the ruins of the Second Empire, the Republicans, although a minority party, were able to control affairs through the lack of harmony among their opponents. Each of the three monarchical parties—Legitimists, Orleanists, and Bonapartists—recognizing its own inability to control the situation, was willing to have the Republicans temporarily in power, hoping that the next turn of the political wheel would bring in its own particular type of monarchy. In the first National Assembly the Royalists and Bonapartists made up the reactionary Right and, united, were in a majority, while the Republicans themselves were made up of numerous and often discordant groups. There were the Extreme Left, which had few members but a large following outside the Assembly; the Left, by far the largest group; and the conservative Left Centre, which gradually gained supporters among the moderate or constitutional Monarchists of the Right Centre. The ministry was a conservative one made up from the Left Centre. The acceptance of this moderate leadership was an encouraging sign, but all unity disappeared as soon as the German occupation ended. During this period the leadership of the radical parties was weak and incapable because of the exile of the principal chiefs after the Commune movement. The Radical strength in the Chamber increased slowly, and in response to its demands the ministry was modified. The united Right was able to pass a vote censuring the change in the ministry, and Thiers resigned, whereupon Marshal MacMahon (q.v.) was elected President as the candidate of the Right (1873). He at first appointed a coalition cabinet from the three monarchical parties. The Right was united only in opposition to the Republicans, and the groups of the Left likewise united solely for the purpose of opposing the government. For a year and a half the different aims of the factions on both sides of the Assembly prevented action on the Constitutional Laws. (See FRANCE.) In June, 1875, fearing the growth of the Imperialist strength, some of the constitutional Monarchists united with the Left to secure the passage of the laws.

The Assembly created by the new constitution consisted of a Senate and a Chamber of Deputies. The Republicans, with a large majority in the Chamber, forced the fighting; and after 1882 they secured a majority in the Senate. They were divided into the Left Centre, Republican Union (the largest group, led by Gambetta), and the Radical Left. The Monarchists, adopting a conservative attitude, were grouped as Right Centre, Right, and Popular Appeal. MacMahon in 1876 made up a ministry from the Left Centre, at first under Dufaure (q.v.), later under Jules Simon (q.v.). In 1877, after a year of struggle against radical measures, acting under the advice of his conservative friends, MacMahon dismissed the Simon ministry, adjourned the Chamber, and then, with the consent of the Senate, dissolved it. The Conservatives then sought to intrench themselves in the government through the power given to the President and Senate by the Constitutional Laws, but the President had by his course opened a bitter struggle which destroyed any possibility of harmony. The Republicans won the elections, refused to recognize a Conserva-

tive ministry, and finally forced the President to form a ministry from the Left Centre. In 1878 the Republicans obtained a majority in the Senate, and MacMahon resigned in 1879, and was succeeded by Grévy. Their supremacy once established, the Republicans renewed their factional struggles. The Left Centre lost its influence. Gambetta's Republican Union was opposed by a growing Radical wing, which reproached Gambetta with opportunism. A series of ministries tending towards radicalism followed. A period of personal politics was entered upon, with ministries combined for expediency rather than as exponents of political principles, 14 different ministries holding office between 1878 and 1888. The two principal wings of the Republicans came to be known as Opportunists and Radicals. The Legitimists united with the Orleanists in 1883, and two years later an increased number of Monarchists were returned to the Chamber. An attempt was made in the face of this growing Conservative strength to unite the Opportunists and Radicals (policy of Republican concentration; the opposite being that of pacification, the alliance of one or more Republican groups with the Conservatives). The pretenders to the throne were banished in 1886 at the instance of the Concentration ministry. In 1887 the Rouvier ministry adopted the so-called policy of pacification. In the same year General Boulanger (q.v.) came into prominence and sought to profit by the prevailing political confusion. His shibboleth, "revision of the Constitutional Laws," won support from all the dissatisfied factions. His party was known as the Revisionist or National party. The support of Boulanger by the Catholic Conservatives alienated his Radical followers, who joined the Opportunists to defeat him. In 1889 the complete overthrow of this political adventurer was accomplished.

A marked change in parties now began. The Republicans who had united to defeat Boulanger continued to act together as Moderates or Government Republicans, and for a time homogeneous ministries were tried, such as that of Bourgeois and Méline (qq.v.). The monarchist parties were all weakened and discredited by their participation in the Boulanger episode. Radicalism came to be more and more represented by the Socialists. This body, hitherto of slight importance, had its origin in the break-up of the Republicans during the struggle against the July Monarchy, those who continued to uphold Republican principles seeking a purely political revolution, while a party of workingmen and theorists sought to make the Republic a means of radical social reform. In 1890 there were four Socialist groups, with views more or less extreme, and increasing political activity. The Socialists broke away from the Radicals, and in 1893 secured 50 seats. A change that greatly strengthened the Moderates was the gradual cessation of clerical opposition to the Republic. Many Catholics who had formerly acted with the reactionary parties now came to the support of the government under the name of *Kalliés*, or the Constitutional Right. There was very little positive legislation during this realignment of parties, and the Freycinet ministry (1890-92) enjoyed a hitherto almost unprecedented term of office. In 1892 there was a startling exposure of the use of enormous corruption funds in promoting the Panama Canal scheme. Over 100 Senators, Deputies, and

officials were implicated, including many political leaders, but even in the face of this the Moderates gained largely in the elections of 1893. The policy of concentration was discarded, and the Moderates took full responsibility, with Casimir-Périer (q.v.) at the head of the ministry. The murder of President Carnot in 1894 was followed by the election of Casimir-Périer as his successor and drastic measures against anarchists. The new President and his government were violently assailed by the Socialists and Radicals for their policy, the Dupuy ministry went down in 1895 before the Opposition attacks, and then Casimir-Périer resigned the presidency. Félix Faure (q.v.) was elected President by a union of the Moderates and the Right, but the Socialists, who had supported Brisson, had shown a significant increase of strength. The first Moderate cabinet (Ribot) gave way in a few months to one much more Radical (Bourgeois), but the latter, after a struggle with the Senate, was succeeded in 1896 by another Moderate ministry (Méline). The Dreyfus case (see DREYFUS) complicated French politics for three years and even endangered the Republic. The Méline ministry, which depended on the support of the Right, came to an end in 1898. A Radical ministry under Brisson wrestled unsuccessfully for a few months with the Dreyfus case. A new coalition cabinet was then organized by Dupuy. On the death of President Faure, in February, 1899, Emile Loubet (q.v.) was elected to the presidency, and in June a new ministry was made up by M. Waldeck-Rousseau. With this event, the recent *bloc* system was inaugurated in the form of an alliance of Radicals and Socialists. A Radical Socialist, M. Millerand, was included in this cabinet. The government took positive measures to put down the revived Nationalist agitation, imprisoning several of the old Boulangists, who had resumed their activity. An amnesty bill in 1900 purged all who were connected with the Dreyfus case. While the government thus tried to still the strife which had injured France, it did not hesitate to bring on a conflict with the Catholic church. This was done by the introduction of the so-called Associations Bill, regulating the privileges and rights of property of certain associations. This measure, while general in its terms, was ostensibly intended to bring within control of the common law the Jesuits and monastic communities, which had no authorization from the state, held large amounts of property, conducted numerous schools, and were directed to a great extent from outside of France. The measure was carried by a good majority in March, 1902. In the April election 382 Ministerialists and but 196 of all the opposition factions were returned. The Premier retired and was succeeded by M. Combes. In 1904 the Combes ministry brought in a bill for the separation of the churches from the state. (See FRANCE.) The Combes cabinet was overthrown in January, 1905. Rouvier headed a ministry which continued the policy of its predecessor and carried through the Separation Bill in December, 1905. Rouvier was defeated in March, 1906, and was succeeded by Sarrien. In the general elections of May, 1906, the government *bloc* won 411 seats, an increase of 58, and the opposition 174. The parliamentary session of 1906 witnessed the rise of conflict between the Socialists and their erstwhile allies. M. Clemenceau suc-

ceeded Sarrien in October, 1906, and his premiership, lasting until July, 1909, was the longest since the establishment of the Third Republic. Even then defeat was mainly personal, arising from criticisms of the naval administration. His policy was frankly socialist, with government ownership of certain railroads, graduated income tax, and anti-clericalism. Five members of his cabinet were continued under his successor, Briand, a Socialist. Briand's vigorous and patriotic opposition to strikers in the wine district and among the government telegraph employees weakened Socialism, and the government *bloc* showed signs of breaking up. His ministry resigned in 1911 because of differences respecting electoral changes and labor legislation. The Monis and Caillaux governments followed, the latter being overthrown in connection with the Morocco negotiations with Germany. In 1912 Poincaré formed a strong, moderate ministry which carried through the proportional representation law. On Poincaré's election as President in 1913 Briand formed a short-lived ministry. Several cabinets were formed thereafter, and fell because of inability to pass labor legislation, until in 1914 Viviani, a moderate Socialist, was selected. The Great War then caused a practical cessation of factional politics. As the war continued, however, much sentiment developed for a coalition cabinet, formed of the strong men of all parties. When complications arose in the Balkans and because of the impasse at the Dardanelles, the Viviani government was considered responsible partly for the entry of Bulgaria on the side of Germany and the neutrality of Greece. In October, 1915, Viviani resigned and Briand was requested to form a government. His cabinet included such men as Freycinet, Viviani, Combes, Ribot, Doumergue, and Bourgeois.

Germany. The national parties in the German Empire have their source and their local counterparts in the separate German states. Bismarck carried his earlier measures by means of the support of a patriotic nationalist party, the National Liberals, whose chief idea was the creation of German unity and who were willing to support the Chancellor. He was also supported, with more enthusiasm, by the Free Conservatives (*Reichspartei*). He was opposed by the Old Conservatives, who clung to the old particularistic régime, and by the Progressists (*Fortschrittpartei*), who rejected all compromises and were the radical wing of the Nationalist party that preceded the formation of the Empire. The Kulturkampf (q.v.) encouraged the growth of another strong opposition party, Ultramontane Catholic, known as the Centre. This had its strength in the Catholic states of south Germany and in the western part of Prussia. From 1893 to 1912 it was the strongest group in the Reichstag. But while the number of its seats in that body decreased from 103 in 1907 to 93 in 1912 those of the Social Democratic party, led by Liebknecht and Bebel, increased from 53 to 110 during the same period. Then came the National Liberals (44 in 1912), Conservatives (43), Radicals (42), Poles (18), Imperial party, progovernmental (14), Industrial Unionist (10), Alsatians (5), Welfs (5), German Reform party (3), and German Farmers' Union (2). The Nationalist party, which supported the foreign policy but opposed the domestic programme, gradually weakened.

The predominance of Prussia in the Empire gives Prussian politics an overshadowing influence, and the Agrarians, who are primarily a Prussian landholders' party, opposed to the present commercial policy of the government and desirous of extreme protection against the importation of foodstuffs, control the Conservative members entirely, the Centrists to a great extent, and have a strong hold among the Poles and Anti-Semites. The government is thus forced, on some of its favorite projects, to look to the Liberal groups for its support. The Agrarians defeated the Emperor's Rhine-Elbe canal project in the Prussian Landtag in 1899, arousing thereby bitter feeling. This strong Agrarian agitation is a most important complication in the already complex party situation in Germany. With the adoption of a colonial policy, a protective-tariff system, and the advent of William II, most of the old issues were gradually dropped and those of economic and commercial development, imperialism, and *Weltpolitik* were substituted. A *bloc* of Conservatives and the Centre supported Chancellors Caprivi and Hohenlohe, while the Social Democrats clamored vainly for domestic reform. Defying the opposition groups, the government strengthened the army, built a formidable navy, developed a merchant marine, acquired colonies, and sought to increase the prestige of the Empire. This party emphasized the cultural efficiency of Germany. The question of ministerial responsibility was widely discussed, but was evaded by the government. In 1906 the old *bloc* dissolved, and Bülow formed an insubstantial one of Conservatives and Liberals. This broke up on the budget of 1908, and Bethmann-Hollwég re-formed the old "blue-black" *bloc* of Clericals and Conservatives. Although the opposition failed to reform the Prussian ballot, it succeeded in forcing the Kaiser to relinquish exclusive control of foreign affairs. Among the Socialists a great change had taken place. They adopted the so-called revisionist programme, modifying the extreme Marxist doctrines in the direction of practical political expediency.

Great Britain. The great political parties in Great Britain at the present time are the Conservatives or Unionists, the Liberals, the Irish Parliamentary or Nationalist party, and the Labor party. The Conservatives and the Liberals are the lineal descendants of the old Tories and Whigs, and although their political ideas are far more advanced than those of their predecessors, they maintain relatively the same attitude towards the questions of the day. The professed policy of the Conservatives is the maintenance of the Empire, the preservation of the constitution in its present form, the union of church and state, the general conservation of vested interests, and a strong imperialist policy. The Liberal party comprises the great majority of the Dissenters in England and of all the voters in Scotland and Wales, but it is nearly always in the minority in England itself. Its policy is one of abstention from foreign complications, economy in expenditure, and reform in the constitution. The Radicals, who form a wing of the party, desire disestablishment of the state church, manhood suffrage, free education, and are the most insistent upon the abolition of the House of Lords. The Liberal party was divided on the question of the South African War in 1899-1902. The whole party opposed it in the beginning, and agreed

in criticizing the conduct of the war by the government. But while the majority favored granting a liberal measure of home rule to the Boers, a Radical minority advocated the independence of the republics. The Nationalist or Irish Parliamentary party was founded mainly through the efforts of Charles Stewart Parnell (q.v.) and is composed entirely of Irish members. Until 1914 it subordinated all other issues to that of Home Rule (q.v.), together with the reform of the Irish land system and of Irish taxation, and is in favor of the establishment of an Irish Catholic university. It has acted with the Liberals since 1886, and violently opposed the Boer War. The Liberal-Unionists separated from the Liberals in 1886 on account of Gladstone's advocacy of Home Rule, and subsequently acted with the Conservatives, their leader, Joseph Chamberlain, becoming the most pronounced advocate of an aggressive foreign policy and of the unconditional subjugation of the South African republics. In the general elections for Parliament held in October, 1900, 334 Conservatives, 186 Liberals, 82 Home Rulers, and 68 Liberal-Unionists were returned. The general election of January, 1906, resulted in an overwhelming triumph for the Liberals, representing a formal government majority of about 350. The most significant outcome of the election was the remarkable growth of the Labor representation, which in 1900 was only 9 and which now ceased to act as a group of the Liberal party and assumed a party organization of its own. By 1910 the Liberal-Union party had ceased to exist, and the election of that year returned to the House of Commons 274 Liberals, 272 Conservatives or Unionists, 84 Irish Nationalists, and 42 of the Labor party. For the account of British politics since 1908 see UNITED KINGDOM and PARLIAMENT.

Greece. There has never been in Greece a division of the voting population into great parties on great political issues, but in modern Greece, as in ancient Greece, the grouping has been rather that of factional followers of some strong political leader. In the frequent change of its ministries Greece bears a striking resemblance to France and Italy, and, as in those countries, the change has very seldom meant a revolution in policy. For the greater part of the decade 1880-90 the so-called parties grouped themselves around two leaders, Tricoupis and Delyannis, from whom were derived the names Tricoupists and Delyannists. In the general election of 1890 part of the Delyannists—then the opposition party—broke away from their former political associates, and under the leadership of M. Rhalli formed a new party organization known as the Neo-Hellenic or Young Greek party. M. Tricoupis died in 1896, and the leadership of his faction fell to M. Theotokis. His followers, called both Tricoupists and Theotokists, represent the more conservative tendency in Greek politics. In 1901 a new political group formed about M. Zaimis, who became Premier in that year. After 1906 M. Venizelos, of Crete, became the dominant personality, and his diplomacy brought Greece a great victory in 1912 after the Balkan War. In 1915 he was anxious for Greece to join with France and England against Turkey, but the King refused. Venizelos resigned and appealed to the country. He was returned with increased majority over the Neutralists, and formed another cabinet, but resigned again at the request

of his King when troops of the allies were landed on Greek territory (October, 1915).

Hungary. Hungary presents the interesting example of a country with a parliamentary form of government in which a single political party retained uninterrupted control for upward of 35 years. This party was the Liberal party—the party of Francis Deák, Julius Andrássy, and Koloman Tisza, whose able leadership was a strong factor in its continued success. This sustained control was due to the skillful electoral qualifications whereby the Magyars, although only 45.4 per cent of the population, were enabled to retain office. During the rule of the party of Deák, which began with the successful passage of the *Ausgleich* of 1867 and lasted until 1875, the opposition consisted of a party of radical Magyars who refused to accept the compromise, but who were in all other respects Liberals, and of a small group of Rumanians and Slavs whose opposition was racial. After Deák's withdrawal from public life in 1875 this radical Magyar party, under Tisza, who became Premier, united with Deák's followers to form the Liberal party, which continued in control until his death in 1902. The premiership of Tisza lasted from 1875 to 1890. During this period the principal opposition came from a small but earnest body of radicals known as Kossuthists, followers of the younger Kossuth, who contended that the only bond of union between Austria and Hungary should be the personal one of the sovereign. Although often having the opportunity, this party consistently refused office rather than serve under the *Ausgleich*. Stephan Tisza, a son of the great Premier, succeeded to the leadership of the Liberal party, and became Premier in 1903. The party was weakened by the secession of a faction led by Count Apponyi, and in the general election of January, 1905, was defeated by a coalition of Kossuthites or Independents and minor groups. After more than a year of bitter political conflict, in which the Independent majority refused to assume office except on the basis of broad concessions to the Magyar nationality, a ministry representative of all parties was formed under the premiership of Wekerle. In 1908 the government, in response to the insistent demands of the non-Magyar races, introduced an electoral bill which by its restrictions through plural voting and language tests made more certain the retention of control by the Magyars. Violent scenes occurred, a deadlock developed, and the ministry resigned. The Emperor sustained the demands for reform, but even this aid was ineffective; and Hungary in 1915 had the worst electoral system of all European countries. In 1910 Tisza organized the National Party of Works, which secured 255 seats in the elections of that year, and in 1913 he rose again to the head of the government.

Italy. There is no well-defined party organization in Italy, and such as exists is subject to rapid fluctuation in constituency and programme. For 15 years after the death of Cavour in 1861 the government was generally directed by a ministry from the Constitutional Right or Conservative side of the Chamber, but after 1876 the Liberal Left came into power and the Right almost disappeared. Such Radical ministries led by Rattazzi had urged the forceful completion of Italian unity. The Left has been largely dominated by Radical elements. Its

accession to power marked the domination of the southern Italians in politics and the era of personal groups or factions without other guiding principle than that of political or financial self-interest. The Radicals ruled from 1876 to 1896, and were led by Depretis, Crispi, and Giolitti. Gross irregularities, violent parliamentary sessions, and a cringing foreign policy characterized the period. From 1896 to 1915 there was a period of composite ministries and artificial groupings, dominated in turn by Giolitti, Sonnino, Luzzatti, and Salandra. There was practically no Conservative party, Giolitti being a Radical and Sonnino a Liberal. The Socialist party was ably led by Bissolati, who was a revisionist. In 1914–15 the country divided into Neutralists, opposing war, and those who favored entry into war on the side of the allies against Germany. Republican and Socialist groups have also played a part in Italian politics. A peculiarly Italian party is that of the Irredentists, who seek to unite with Italy the Italian portions of Austria, Switzerland, and France, or unredeemed Italy (*Italia irredenta*). A serious embarrassment in Italy since the union has been the abstention of good Catholics, under direction of the Vatican, from participation in politics until 1903, when a Catholic party was organized, which practically accepted present conditions. In 1913 it elected 24 members.

Japan. Political parties may be said to have developed after the promulgation of the constitution in 1889, which granted a representative legislature. The parties were based on the four clans, Satsuma, Choshu, Tosa, and Hizen. The first two were aristocratic and conservative and formed the basis for the *Seiyukai*, or Constitutional Political Association, organized by Marquis Ito in 1902; the last two were somewhat liberal and democratic and gave members to the *Fuyu-to* (Liberal) and the *Shimpo-to* (Progressive) parties respectively. The *Daido Club* was a conservative organization of business men; the *Boshin Club* offered radical principles; and the *Yushinkai* was independent and Socialistic. The Progressists, founded by Count Okuma, was the imperialistic party, seeking Japanese expansion. Political parties have not been well organized, but have been rather in the nature of clubs. In 1908, however, the *Seiyukai*, on a national platform, succeeded in defeating the *Daido Club* and in securing an absolute majority in the House of Representatives. It was thought that this success would result in effecting ministerial responsibility. The old system of appointment of the cabinet by the Emperor on advice of the *genro*, or committee of elders from the House of Peers, persisted, however, despite the grave political scandals of 1909 and 1912. Although unpopular, Premier Katsura remained in office from 1908 to 1910. Politics in Japan are somewhat personal, ministries are unstable, and late political history has been characterized by much venality and graft.

Netherlands. The history of political parties in the Netherlands has been an uneventful one, owing largely to the fact that during the greater part of the last half century the Liberals, consisting of Moderates and Progressives, have been in almost undisputed control of affairs. There have been, however, infrequent overturnings of their régime, brought about generally by a temporary coalition of the opposing group.

The most recent revolution of this sort took place in 1901. The Catholic party, together with its allies the Orthodox Protestants, has for many years formed the most compact and well-organized group of the opposition, but its refusal to participate in coalitions had rendered its opposition of little effect. The last few years, however, have been marked by a remarkable growth in the power of the Orthodox Protestant party or Anti-Revolutionists, who for some time were satisfied to take only a passive part in political affairs. This party finally effected a coalition with the Catholics, led by Kuyper, and in the elections of 1901 achieved a striking victory over the Liberals, who were weakened by dissensions and by a reputed alliance with the Socialists, who demanded universal suffrage. A Clerical Anti-Liberal ministry was formed in which the Catholics were given three portfolios. Other parties represented in Parliament are the Historic Christians, Radicals, and Socialists. From 1903 to 1909 the Liberals ruled and their tenure was colorless. In that year the Conservatives regained complete control.

Norway. See under that title.

Portugal. Between 1834 and 1852, the old Absolutist party having become extinct, the Liberals, who had successfully opposed the Absolutists, divided into two parties, the Chartists, who supported the strongly monarchist charter of 1826, and the Septembrists, who rallied around the popular constitution of 1822. A coalition of Septembrists and Chartists, known as Regenerators, took control of the government in 1852, but this coalition soon broke up and the Historic Left was formed from its remnants and merged in 1877 with a new Reformist party, as Progressists. The Regenerators now form the Right, or conservative section; the Progressists the Constitutional Left. There was also a small but active and growing Republican party, formed in 1881. The two great parties between 1877 and 1910 simply rotated in office. Politics were notoriously corrupt, and the Republicans were systematically prevented from holding office, although majorities were often returned for them. From 1906 to 1908 Franco, a determined reformer, was Dictator. His efforts only spurred the Republicans into greater activity. His work was undone, the King assassinated, and a period of political confusion ensued, terminating in the revolution of 1910, whereby a republic was established. Under it there developed the Radical, Socialist, and Monarchist parties.

Russia. Political parties in the modern sense of those participating in actual legislative processes date from the announcement of the Fundamental Law of 1905. (For parties which antedate this event, see GREEK CHURCH; Nihilism; RUSSIA; RUSSIAN LITERATURE; ETC.) The law establishing the Duma was announced on August 19 and that decreeing a fundamental law on Oct. 30, 1905. Most of the legally recognized political parties developed from approval or opposition to these manifestoes: the Octobrists, organized by Milutin and Shipóff, and the Nationalists supported them as being well suited to needs; the Right, composed of the Clerical reactionaries and the Conservative Democrats, opposed the fundamental law as giving much power to the Duma; the Left, composed of the Cadets or Constitutional Democrats, led by the distinguished historian Mil-

youkov, Progressists, Labor party, and revolutionary Socialists, opposed it as giving too little. In addition to these alignments there were parties based on race distinctions, there being 14 races represented in the third Duma. Secret organizations, such as the Okhrana or Secret Political Police and the Union of the Russian People, also exert powerful political influence. Under the liberal electoral law of 1905 a Duma was selected which gave the Cadets and the radical reform parties control. Count Witte, the author of the October manifesto, had been dismissed, and M. Goremykin was the Premier to meet the Duma. A deadlock almost immediately developed when the conservative ministry refused to adopt or even to discuss the radical and comprehensive reform programme of the Duma. Goremykin fell, and M. Stolypin, an able though stern constitutionalist, was made Premier. The Duma was dissolved and another elected in 1907, with the same parties in preponderance. In the midst of the great disorder and repression then existing the revolutionary parties severely criticized the government. It was alleged that members of the Social Democratic parties were in conspiracy against the Emperor, many were arrested, the Duma was dissolved, and some of the Socialists withdrew to Viborg to draw up a manifesto urging the people not to pay taxes. A new and complicated electoral law was announced by Imperial ukase (1907), whereby large elements of the radical parties were disfranchised and the control of the Duma was given to the wealthy landowners. Repression almost destroyed the leaders of the revolution. The third Duma met in 1907 and was controlled by the Octobrists and Nationalists, then in coalition. The leader of this group, Guchkov, who insisted upon conservative reform and a national programme for a Great Russia, was made President. In 1909 the Nationalists adopted a distinctly Slavophil policy with education, militarism, and Russification as features. In 1911 Stolypin, who had accepted the Nationalist policy, was assassinated and was succeeded by M. Kokovtsov. In the election for the fourth Duma, in 1912, the Clericals attacked the Octobrists with extreme bitterness, and that party suffered a defeat, losing its leader. The result was a victory for the Right, although the Centre and Left combined to elect the President, Rodzianko. In 1913-14 the Octobrists divided into factions, and the majority of the Duma became more conservative. Kokovtsov was dismissed in 1914 and Goremykin was returned to office. The Great War in 1914 effected a practical consolidation of parties in support of the government. For text of the fundamental law of 1905 and the later changes, consult Dodd, *Modern Constitutions*.

Spain. Spanish parties have been in a state of confusion ever since the beginning of the struggle for constitutional government. During the first third of the nineteenth century the struggle between absolute monarchy and constitutionalism brought into existence different parties maintaining all gradations of political opinion from absolutism to radicalism. After 1833 the dynastic parties of Carlists and Cristinos arose. (See CARLOS, DON; SPAIN.) There were also two Liberal parties—Moderates and Progressists. These parties disintegrated about 1850-51 and new temporary combinations were formed. The revolution of 1868, which

overthrew Isabella II, was followed by a struggle between Republicans and Monarchists, which, after the resignation of King Amadeus in 1873, resulted in the short-lived republic under Castelar. In 1874 the monarchy was restored, and in 1876 the new constitution gave opportunity for a new alignment. Under this there were two constitutional monarchist parties—the Conservatives, made up chiefly of the clergy and aristocracy, and the Liberals (Constitutionalists or Dynastic Left). In addition to these two true political parties were the Carlists, who were irreconcilable absolutists, the Republicans, and the Possibilists (a name having much the same meaning as Opportunists in France). The Republicans have an increasing strength in Spain. For many years Cánovas del Castillo and Sagasta, the respective leaders of the Conservative and Liberal parties, had been alternately in power. Just before the war with the United States Sagasta (q.v.) and the Liberals again took the helm. The peace negotiations brought the Conservatives once more into power but the administration was a troubled one. Since 1900 Spain has suffered from political instability, the ministries changing almost every year. The forceful leaders were Maura, the Conservative, and Canalejas, the democratic Liberal. The execution of the Liberal anarchist, Ferrer, and the Morocco crisis drove Maura from office in 1909 and the Liberals assumed power. The cumbersome electoral law, requiring candidates to be renominated by some member or ex-member of the Cortes or Senate tends to prevent the revolutionary parties from securing office. See SPAIN.

Sweden. The parties are the aristocratic Conservative party, forming the Parliamentary Right and having its strength in the cities, and the rural Democratic party, the Parliamentary Left, known as the Rustics. In recent years an urban Democratic party of decidedly radical tendencies has arisen. The Socialists, organized as a party in 1889, joined the Democrats and a demand was made for universal suffrage. The first purely Liberal cabinet was formed by Staaff, in 1905, as a result of events connected with the dissolution of the union with Norway. The issue dividing parties until 1907 was the electoral law. An Act was passed in 1909 granting manhood suffrage and proportional representation for the Lower House of the Riksdag. In 1912 a limited female suffrage was granted allowing women to vote for members to the Lower House. In 1914–15 the chief issue was military defense and increase of armament. The Conservatives advocated this programme and were successful. The Social Democrats made marked advance.

Switzerland. There is no party government in Switzerland and no party machinery such as is necessary in countries where there is party government. Minority representation is responsible for this. There are parties, however. The political history of the present confederation begins in 1847, when the Radicals triumphed over the Catholic Sonderbund. The most enduring political cleavage then and subsequently was centralism versus federalism, but this issue has lost most of its real significance. Liberals, Radicals, and Catholics were thereafter the parties that appealed to the suffrages of the people. The two former divided at first on the attitude of Switzerland towards the revolutionary movement elsewhere; then on railroad development

and other questions. In the struggle over constitutional revision from 1864 to 1874 revision was opposed by the Ultramontane Catholics and by the French and Italians, who feared the domination of the German cantons. After the revision there were new adjustments of party relations. The Vatican decrees of 1870 were opposed by a body of Swiss Catholics, who rejected the dogma of papal infallibility. They were known as Old Catholics, and their recognition by the Swiss government as the true Catholic body precipitated a contest with the Vatican and the Ultramontane Swiss Catholics. The Ultramontanes or Clericals, the legislative Right, became a strong and aggressive political body. On the other side the Radicals form the Extreme Left, believing in the absolute severance of both Protestant and Catholic churches from politics. The Radicals differ in their attitude on questions outside of Church matters, the French being opposed to the national centralization which is sought by the Germans. The Centre, or Liberal Conservative party, is far from homogeneous and united. It is made up mainly of the conservative moneyed classes. A Catholic People's party was formed in 1894. Socialist party movements, although many have been set on foot by foreigners who have found asylum in Switzerland, have not flourished on Swiss soil, but the Grütliverein, a society founded in 1838 on a democratic basis, has been gradually adopting Socialist ideas. The Liberals or Centre oppose paternalism and stand for individual rights. They comprise a large part of the wealthy classes. Parties have been remarkably stable and sudden fluctuations have been unknown. The Socialists have opposed the policy of military expenditures, and for a time suffered. For the advanced legislation, see SWITZERLAND.

POLITICAL SCIENCE. That branch of the social sciences which deals with the organization and life of the state. It comprises the consideration of the general problem of the origin and nature of the state, investigations into constitutional forms, political forces, and modes of public administration, and the attempt to establish sound rules and maxims of political action. The characteristic feature of political and legal, as distinguished from purely social, facts lies in the presence, in connection with the former, of a definitely organized personal authority endowed with determinate functions and enforcing its decrees by a fixed sanction.

In the original Greek sense, "politics" refers to the entire art of realizing the ethical ideal in the state by the establishment and maintenance of orderly government, but in modern times this term is often used in a much more restricted sense. The characteristic political fact, according to the modern usage of language, is the struggle for personal authority in an organized community, as well as the struggle for the maintenance of the power of the whole state. The definite organization of power for the purposes of orderly government, the marshaling of popular support and of popular opinion, the creation of centres of control, and the defense of the entire structure of the state against attacks from without and from within—these constitute the characteristic problems of politics in the narrower sense. Whenever we deal with the dynamic facts of state life we therefore have primarily political considerations. This is the case in such subjects as diplomacy and international politics, party politics, and all the creative activities of the government. In this sense it is a political action to appeal to voters and to organize them into parties, to advance the candidacy of certain persons for office, to create a willingness for effecting changes in the law, or to obtain treaty advantages from foreign powers.

But state life may also be viewed as static—established in certain permanent forms and administered according to fixed rules. Here the conditions of political struggle for power and advantage are almost entirely eliminated and the state is looked upon as a commonwealth administered for the benefit of all citizens. The studies of public law (international, constitutional, and administrative), jurisprudence, and the technical methods of administration belong under this heading. They deal with state life as settled, as administered only by expert authorities and not immediately affected by the popular struggle for political power. By analogy this group of studies may be said to deal with the anatomy of the state, while the dynamic studies deal with its physiology.

Though the fundamental fact of political struggle will always remain the chief characteristic of politics, it must also be noted that the sphere of static institutions is constantly ex-

panding as the state develops in civilization. In the earlier ages the struggle for power swallowed up all available energies, and all considerations were subordinated to the political success of competing groups. Administration was viewed merely as the opportunity of the ruling group to fortify its position and to enjoy the fruits of power and influence. Even the "benevolent despotism" of the eighteenth century held that the chief reason why the prosperity of the lower classes should be protected was to maintain their value to the government as taxpayers. In an absolute monarchy the intrigues among contending factions seeking royal favor usually absorb the entire attention of the political classes, leaving but little to be devoted to the administration of the commonwealth. Now, although a system in which political struggle would be entirely eliminated is perhaps inconceivable, the ideal of a commonwealth demands that the ordinary administration of the state be placed as much as possible outside of the sphere of personal struggles for political power. For this reason the civil service should be rendered independent of political changes and an expert administration placed in charge of the current affairs of the commonwealth. Among the practical problems of politics at present there is none more important than the question as to how far the political representatives of the citizens—the parliamentary body—can profitably control and interfere with expert administration. While the sphere of parliamentary interference and control over the administrative departments may seem to be contracting, this is not to be taken as a sign of the absolute failure of parliamentary government, but as an indication that the development is towards a more perfect adjustment between the popular or political and the expert agencies in government.

Above the two aspects of political dynamics and statics, and embracing both, stands political theory or political philosophy, which deals with the general problem of the nature of the state. Viewing the state as a universal form of human association, it attempts to analyze the principles upon which its authority rests and according to which its functions are performed. Closely allied to it is the subject of political ethics, which tests the ideals of state forms and of political action. Among the Greeks these various aspects of political thought were not dissociated; politics was considered as the means of giving practical form and existence to the true ethical ideals. The Hellenic sense of concrete vision, however, guarded against a confusion of existing institutions with the ideal schemes of philosophical discussion. This distinction was not kept clear in the Middle Ages, and in self-defense the modern school of political science, following Machiavelli, has striven clearly to distinguish the actual from the ideal.

Purposes of Political Science. The primary purpose of political science is the understanding of the general laws of state life. This, however, does not involve the tracing back of political institutions to primal impulses in animal life and to dominant influences exerted by inanimate nature, a work which sociology and social psychology are attempting to do. Political science takes interest, motives, and purposes as it finds them, investigates their relations to one another, traces their mutual influence, and studies the political action and institutions created by them. Thus, in a modern state it will investi-

gate the grouping of interests in parties, observe the leading personalities who embody the purposes of large groups of men, and study the methods through which these purposes are expressed in legislation and realized through administrative action.

The second purpose of political science is the understanding of the forces, forms, and practices of contemporary political life. Although the aid of history is essential towards a thorough understanding of contemporary institutions, a minute analysis of their actual workings is equally indispensable in political science. This need not be purely empirical, but by the comparison of modes of action in various states a basis for scientific induction and generalization will be furnished. This purpose will therefore best be achieved by the combination of two methods—the detailed analytical study of institutional forms and administrative technique in any one nation and the comparison of the results thus obtained with institutions and practices in other states.

A third object of political science consists in the formation of political purposes and in providing a basis for political action. Far from involving merely a priori reasoning about human nature and about the actions proper to it, this pursuit is concerned with the establishment of practical conclusions upon the basis of wide and accurate information. In this aspect politics is an applied science—both normative and teleological—which determines the best mode of political action upon the basis of the most complete scientific information procurable.

Relation of Political Science to Other Fields of Knowledge. The relation of politics to the general science of society has already been indicated; its field is more restricted and the character of its methods teleological rather than causative. (See SOCIOLOGY.) The relation of politics to psychology also is that of a teleological to a causative science. All political institutions may be looked upon as psychological facts having their existence only in the mind, although they may be of the greatest tenacity and are in turn productive of concrete facts such as public buildings and improvements. But psychology, like sociology, is a causative science, going back of the purpose or concept with which politics starts and trying to investigate its psychic and physiological origins. The science of economics deals with a different set of social phenomena, which, however, have the closest bearing upon politics. Not only is political influence largely determined by economic power, but the constant interference of political agencies with economic interests and processes makes it necessary for political science to give special attention to economics. The field of history, like that of sociology, embraces political action together with the other manifestations of social life. But history differs specifically from politics in that its purpose lies in tracing individual chains of causation, whereas politics, by the use of the comparative method, establishes broader generalizations. The science of statistics furnishes a basis of induction for all the social sciences. Both in the study of the composition of political forces and of the results of political action regarded as experiments, the aid of statistics is indispensable. The knowledge of the material body and of the physical basis of state life is furnished by the sciences of ethnology and geography, the results

of both of which form the most essential data of political science.

Methods of Political Science. The scientific method of politics acquires its materials by the historic study of individual institutions, by the analysis of contemporary political life, by statistical investigation, and by the comparative study of institutions. On the basis of the facts thus secured it arrives by the process of induction at the general laws and principles of political action. The most distinctive features of this method are a sharp juristic analysis of institutions and the discovery of true analogies in different systems. By the application of this method the materials furnished by a number of auxiliary sciences are subjected to analysis and become the elements for a recomposition which results in a clear and definite grouping of social purposes in the form of political action. As the facts with which politics deals are much more definite than those of the general social sciences, and as political institutions and laws constitute, as it were, a precipitation of social forces endowed with great permanence and solidarity, the study of political development will always remain the backbone of historical work. Although we need not accept Freeman's dictum that history is past politics, it may be said that historical forces are most clearly understood, although perhaps not completely fathomed, when seen from the point of view of the growth and succession of political institutions and laws.

The principal methods auxiliary to political science are the historical, the statistical, the experimental, the analytical, and the deductive method. Political studies have always drawn their material chiefly from the recorded history of mankind, and are therefore assisted by the technique of the historical method—the critical scrutiny of documentary evidence and the mastery of the laws of cause and effect. But although politics, as indeed every other social science, has thus to make use of historical material, its problems differ distinctly from those of history. It is the function of history to explain a succession of events and actions through the discovery of a causal relation. The function of politics, on the other hand, is to explain a given institution through an investigation of its origins as well as through comparison with similar institutions elsewhere. To history all the transformations of a given institution are equally interesting; to politics, only those which explain its present character. Thus, in the study of the English parliamentary system of the present, political science need not give consideration to the original causes for instituting the British Parliament, as other causes have been substituted upon which the parliamentary régime is at present based. Therefore, in general, in a succession of substituted causes, political science would not go back of the causes directly operative in the institution to be explained, while to history the whole series of substitutions is important.

The statistical method furnishes much valuable and trustworthy material to political science, and for the knowledge of the physical body of the state statistics of population and detailed accounts of the economic products are indispensable. Similarly the effect of certain modes of legislation and of political action can best be tested by a study of their numerical results, such as, e.g., the operation of the liquor laws and of laws to foster agriculture, irriga-

tion, etc. But the more specifically political activities also may be approached by the statistical method, as when we study the attendance upon elections, the votes upon constitutional amendments, and the various groupings of political power. We must not, however, overlook the limitations of the quantitative method. An attempt to reduce political action entirely to quantitative form, and thus to trace it back to the working of physical causes, would result in failure, because the complex force of sentiment, sympathy, tradition, and other psychological factors cannot be quantitatively measured nor reduced with exactness to quantitative causes in the physical world.

Scientific experimentation is not possible in politics, because we cannot use a society purely as a subject of demonstration. Moreover, we have the opportunity to study the influence of any one cause by carefully excluding the operation of all others, as we may do in physical experiments. While, however, the scientific experiment pure and simple is by the nature of things excluded, practical experiments are constantly being made in politics, i.e., courses of action are tried without a knowledge of the exact results to be produced by them, but in the hope that certain improvements will be effected; as, e.g., in changes of the criminal law or in the methods of nominating and electing public officials. Such action, although not undertaken purely as an experiment, is experimental in the sense that the nature of its consequences can be definitely ascertained only through experience and that the action is undertaken with a knowledge of the possibility of varying results. Therefore, while politics as a science cannot set aside certain social factors for experimental purposes, as an art it is continually making experiments in practice, which in turn furnish the most valuable kind of material to scientific political study.

The importance of the analytical method has already been indicated above. As in the investigation of political and legal institutions the juristic bias is naturally very strong, there is constant danger in political science of resting satisfied with mere analysis of structural forms. A scientific method, while it must make use of the trenchant instrument of analysis, must also extend its range so as to embrace the real motive forces that lie back of institutional forms. The natural-law theory has always favored a purely juristic interpretation of institutions, and the scientific study of politics has been much retarded by the one-sided use of analytical methods leading to disputes over fine-drawn but unimportant distinctions, while apparent definiteness of the results obtained often causes men to overlook the powerful forces operating in political life.

The deductive method is thus explained by Professor Sidgwick in his *Elements of Politics*: "We assume certain general characteristics of social man, . . . and we consider what laws and institutions are likely to conduce most to the welfare of an aggregate of such beings." While this method is perfectly legitimate and has been fruitfully employed by most of the great political writers, it would be a mistake to suppose that it is the sole or even the principal reliance of scientific politics. In fact, if employed alone and unassisted by the study of concrete facts, it opens the door to hasty generalization and to the profitless expounding of threadbare theories. It takes on the subjective

coloring of the writer's mind and it does not in itself furnish a stable basis for the scientific pursuit of political investigation. Politics is made a science through the use of inductive processes. The careful study of political experience and of the ever-varying forces of political life provides the rich harvest of observation upon which general principles and maxims may be founded with a certain amount of warranted assurance; and though it may not as yet provide a large number of exact generalizations and rules for practice, it still is recognized as leading to a fuller mastery than does deductive reasoning, by giving the mind an insight into the wealth of incident and the dramatic action of politics. The deductive method is of value in the matter of applying knowledge to political action, when after a careful study of political forces and institutions their general nature and operation are understood. Such knowledge may then well be applied by a deductive process to concrete political action.

Branches of Political Science. In accordance with the general division of political science which has been indicated above, we may group the various branches of the subject as follows

Political Dynamics—

1. Diplomacy and International Politics
2. Party Politics.
3. Comparative Legislation
4. Governmental and Administrative Policies

Political Statics—

1. Constitutional Law
2. International Law.
3. Administrative Law and Technique.
4. Comparative Study of Institutions
5. Jurisprudence.

General and Normative Politics—

1. Political Theory.
2. Political Ethics

It would, of course, be impossible to deal with the living forces of public life without paying regard to the settled institutions, or, on the other hand, to investigate the latter without giving attention to the motive forces by which they are supported, and, no matter what subject in politics may be under consideration, generalizations belonging to political theory or ethics never can be excluded. While these various subjects are thus intimately interrelated, each of them nevertheless forms the centre for a group of specific considerations and preserves in the main its own point of view. But their mutual relations never should be overlooked. A study of the public law of any state without attention being given to political forces and their modes of action fails to convey a just conception of political life. In a state like the American Union, founded upon the theory of government by law deduced from a written constitution, static and juristic facts are often placed unduly in the foreground. The discussions in the American Congress are usually given a juristic turn, so that, e.g., the consideration of measures dealing with economic subjects like the trusts will be based primarily on constitutional arguments. The greatness of such statesmen as Lincoln consists in their knowledge of the true motive powers and in their readiness when necessary to modify juristic principles so as to adapt them to the living forces of politics—"to throw the Constitution overboard in order to save the Constitution." International law and diplomacy similarly bear a close relationship to each other. Not only is the former

largely a result of the efforts of the most enlightened diplomatists, but its enforcement is always conditioned by the actual grouping of the various factors in international politics. The study of comparative legislation furnishes materials to general jurisprudence, and this in turn enables the legislator to secure greater harmony and a more effective structure in his legal enactments. Practical politics, while primarily founded upon the grouping of interests, cannot afford to overlook the principles of political theory which pervade the thought of the people and give direction to their action and their enthusiasm. Political theory, on the other hand, should strive to be an expression of the cardinal facts of actual political life, and consequently the theory of democracy can no longer rest upon the original concept of an ideal state of nature. The intimate connection between practical politics and political ethics would not seem to need emphasizing were it not for the fact that certain writers, like Machiavelli, have dissociated political considerations from ethical principles, and also that in the practical politics of the lower type but very little application of ethical motives can be perceived. Even the details of administrative technique have a close connection with dynamic politics, for often a method of action that seems thoroughly convenient, and indeed almost necessary from the administrative point of view, may be subject to grave objections when the political life of the state is considered.

Literature of Political Science. It has been intimated with some truth that politics has not as yet fully made good its claim to rank as a science, because political literature lacks that succession of effort which constitutes the progressive element in the natural sciences. In the latter an investigator will take up the work where his predecessor has left off. In politics there has been no such development by successive, long-continued effort; any writer considers himself well qualified to contribute a valuable discussion on a subject with which all men of common sense are supposed to be competent to deal. In fact, some of the most famous writers on politics, such as, e.g., Locke and Rousseau, had no political or legal training whatever. In many cases great philosophers have aimed to give completeness to their general system of thought by constructing a part on political science, which is, however, in such cases usually composed merely of deductions from general theoretical principles.

The constitutional studies of Aristotle and the principles developed in his *Politics* form a sound basis for the science of the state; but, unfortunately, he had no successors to carry on the work in his spirit for almost 2000 years. During the Middle Ages Aristotle exercised a profound influence upon scholastic philosophy, which followed his doctrines very closely. Machiavelli took up the thread, and on the basis of a keen study of political facts, both in the records of Roman history and in the life of his own times, constructed his principles of practical politics. His work is founded upon actual observation, but like Adam Smith, he deals exclusively with certain definite human activities and characteristics to the exclusion of all others, and constructs for us the Political Man—animated solely by the will to gain political power. Jean Bodin lived in the thick of the religious struggles in France, and his work is a direct result of the need he felt for a definite

basis of authority in the shifting circumstances of his time. His theory of sovereignty may be called the portal of modern political science, because it first clearly focuses all political action in the sovereign and places the source of political power within the state itself; but the theory is primarily juristic and has given rise subsequently to many theoretical constructions which do not accurately express the forces of political life. Three of the great philosophers of the seventeenth century—Hobbes, Spinoza, and Locke—developed political theory as a part of their philosophical system; but, though starting from similar premises, they arrive at entirely different conclusions. The thought of their age was primarily mathematical, and their method is purely deductive, developing a system of political structure from a few principles assumed as axiomatic, in the manner of a theorem in geometry. The impulse which was given at this time to the mathematical sciences, and through them to the physical, led to an effort on the part of Montesquieu to explain the connection between political institutions and physical environment. Scientific in the sense of basing his results upon induction from facts, Montesquieu lacks the critical spirit of the Historical school and is often captivated by mere fanciful analogies. Burke has a scientific conception of politics in the sense of seeing in institutions a natural development and of basing his political principles upon a careful study of political experience; but he idealizes the past and looks upon the present rather with the eyes of the statesman who is defending certain forms of political life than in the spirit of the scientific investigator. Rousseau, Kant, and the entire Classical Liberal school are all given to a priori reasoning, taking as their starting point the rational individual, they endeavor to construct a system of government in which his independence may be preserved. The fact that Rousseau's theory has been made by varying interpretations the basis of liberalism, of democracy, and even of state socialism indicates the ease with which the deductive method may be used to produce any result desired.

In the nineteenth century a truly scientific method began to be applied to the study of political facts. Savigny, Maine, Ihering, Pollock, Maitland, and Judge Holmes have applied the historic method to institutional and legal facts. The careful observation and analysis of contemporary institutions has led to fruitful results in the works of De Tocqueville, Bagehot, Bluntschli, Woodrow Wilson, A. L. Lowell, and Ostro-gorski. Writers like Jellinek and Burgess, while juristic in their method, give careful attention to existing state forms. Cornwell Lewis combines the scientific method of observation with a highly philosophical spirit. Lately a school of political scientists has arisen who apply to their writings the term "sociological." They hold that the true study of politics should rest, not upon the legal analysis of institutions, but upon an investigation of the forces of society that are striving to express themselves through political action. They emphasize particularly the existence of groups within the state that represent common interests and are animated by common motives, and they conceive of state life as made up of the struggle and competition between these social groups. The principal representatives of this theory are the Austrians Gumplowicz and Ratzenhofen.

The inductive method, based upon observation and the study of recorded facts, is, however, not the only one employed by eminent writers on politics during the nineteenth century. Hegel's purely philosophical construction of the state finds an echo in the writings of T. H. Green and of Bosanquet. The deductive method is used by Sidgwick, Lieber, Mill, and the Liberal school in general. The juristic method of analyzing existing institutions is still almost universally in the ascendant in books dealing with jurisprudence and constitutional law. The works of American constitutional jurists are primarily analytical, and although they devote considerable attention to the history of the formation of the Constitution, this is done in order more fully to explain that instrument, which is then analyzed and examined in all its bearings upon modern government. English jurists like Holland, Anson, and Dicey still employ this method with preference, although the historic study of law has made great progress in England. See CIVIL ADMINISTRATION; CONSTITUTIONAL LAW; DIPLOMACY; GOVERNMENT; INTERNATIONAL LAW; SOCIOLOGY; STATE.

POLITICAL SECRET SOCIETIES. See SECRET SOCIETIES

POLITICS, THE. A work by Aristotle discussing the relation of man to the state and the different forms of government, and presenting an

ideal state incorporating the best points of various systems.

POLITIQUES, pò'lè'ték' (Fr., politicals). The name of a party which arose in France in the reign of Charles IX, composed of moderate Catholics and Protestants, and aiming at the termination of the civil strife by a compromise between the two factions on the basis of religious toleration and the preservation of the rights of the state as against the privileges of sectaries. It was influential in establishing Henry IV on the throne. See FRANCE.

POLITY (Gk. *πολιτεία*, *politeia*, polity, citizenship). A term used to describe the system on which a state or a church is organized as a structural unity. In civil usage the principal forms of polity are monarchy, the rule of one man; aristocracy, the rule of the best; democracy, the rule of the people as a whole; oligarchy, the rule of a few. In ecclesiastical organization the principal forms are the papal, in which supreme government is placed in the hands of the Pope alone; the episcopal, in which it is shared by the whole body of bishops; the presbyterian, where it is held by an assembly of presbyters; and the congregational, in which each congregation is independent of any central government.

POLITZER, ADAM (1835-). An Austrian aurist. He was born at Alberti, Hungary, studied in Vienna, Würzburg, Paris, and London, in 1861 became lecturer at the University of Vienna, and in 1894 professor of otology. He had achieved great success in 1863 with the publication of his method of treating deafness consequent on catarrh of the inner ear, and he gathered at Vienna a wonderful collection for the anatomical and pathological study of the ear. The more important works of Politzer are: *Beleuchtungsbilder des Trommelfells* (1865); *Lehrbuch der Ohrenheilkunde* (1878-82; 5th ed., 1908); *Die anatomische und histologische Zergliederung des menschlichen Gehörorgans* (1889); an *Atlas der Beleuchtungsbilder des Trommelfells* (1895); while his *Geschichte der Ohrenheilkunde* (2 vols., 1907-13) is a standard work.

POLIXENES, pò-lik's-è-néz. The King of Bohemia, in Shakespeare's *A Winter's Tale*, whom Leontes attempts to poison.

POLIZIANO, pò-lèt-sè-à'nò, ANGELO (Latinized form, *Politianus*) (1454-1494). An Italian scholar and poet. He was the son of a doctor of civil law and was born at Montepulciano in Tuscany. The family name was Ambrogini, but Poliziano took his name from that of his native town—in Latin, Mons Politianus. He studied Latin at Florence under Cristoforo Landia, Greek under Andronicus of Thessalonica, the Platonic philosophy under Marsilio Ficino, and the Aristotelian philosophy under Argyropoulos. When barely 15 years of age he published a poem of 1400 lines in honor of Giulio de' Medici, who had carried off the palm at a tournament. Lorenzo de' Medici took notice of the brilliant lad and, to afford him the means of continuing his studies, appointed him tutor to his two sons and subsequently gave him a residence in his charming villa near Fiesole, a few miles east of Florence, where Poliziano, who was passionately fond of country life, resumed his studies with fresh ardor. In 1484 he accompanied the Florentine ambassadors to Rome and was received in a flattering manner by the Pope, at whose request he translated into Latin

the Greek historian Herodianus, for which he received 200 gold crowns. He made also Latin versions of the *Enchiridion* of Epictetus (q.v.), the *Charmides* of Plato, and other works, with such elegance that Erasmus pronounced him a master in translation. After filling for some years a chair of Latin literature in Florence, he began the teaching of Greek. His popularity was so great that pupils came to study under him from all the great cities of Italy and even from distant parts of Europe; of these the more notable were Francesco Pucci, Fortiguerra, Maffei da Volterra, Grocyn, Thomas Linacre, and Michelangelo. In 1489 appeared his *Miscellanea*, a collection of critical and other observations on the ancient authors. Towards the close of his life he entered into orders and was made canon of the cathedral of Florence. Among the brilliant scholars of the Italian Renaissance Poliziano occupies a foremost place in virtue of his vigor and originality. While he admired the chaste and noble literature of antiquity, there was nothing servile in his imitations; he reproduced without difficulty the strength of

Tacitus, the elegance of Livy, and the conciseness of Sallust; his Latin poems, especially his elegies, display the beauty and ardor of his imagination. Among his vernacular pieces may be mentioned his *Canti carnascialeschi* (Carnival Ballads), remarkable for their felicity of style, sweetness of pathos, and abundance of imagery. Another proof of his varied poetical power was his *Orfeo*, one of the earliest dramatic compositions produced in Italy. For his life and works, consult the valuable book by F. O. Mencken (Leipzig, 1736); Carducci's edition of the Italian poems (Florence, 1863). Consult also: Gresswell, *Life of Politian* (London, 1805); Serassi, *Vita di Angelo Poliziano* (Milan, 1808); Norbert Bonafous, *De Angeli Politiani Vita et Operibus* (Paris, 1846); W. Roscoe, *Life of Lorenzo de' Medici* (10th ed., London, 1851); J. A. Symonds, *The Renaissance in Italy* (ib., 1875-86); id., *Sketches and Studies in Italy* (ib., 1879); J. E. Sandys, *Harvard Lectures on the Revival of Learning* (Cambridge, 1905); id., *A History of Classical Scholarship*, vol. ii (ib., 1908).
